NAVAL OBSERVATORY, The United States. A government institution located on Georgetown Heights, Washington, D. C., and constituting a division of the Bureau of Navigation of the Navy Department. Its functions are to make and publish observations of the sun, moon, stars and planets for use in compiling the *American Ephemeris* and *Nautical Almanac* and the *American Nautical Almanac*; to make general astronomical observations; to furnish the country and adjacent oceans with correct time, enabling navigators within radio reach of the naval radio station at Radio, Virginia, to find their positions without dependence upon uncertain chronometer rates, and ocean survey parties to get daily longitude data; to purchase, inspect, repair (or supervise repairs to) and issue all navigational instruments, including gyro-compasses, chronometers and sounding apparatus, for the navy, the navy aero service, the coast guard and the light house service, and, during the Great War, for vessels constructed by the Shipping Board and transports taken over by the government; it serves as a longitude station. In the winter and spring of 1913-14 the Naval Observatory, by means of the naval radio station at Radio, Virginia, and in co-operation with the Paris Observatory and the Eiffel Tower radio station, made the first transatlantic radio longitude determination.

The observatory comprises a group of buildings erected on the present site in 1893, the main building containing the offices of the astronomical, nautical instrument, time service and *Nautical Almanac* departments. A national observatory was planned as early as 1810 but Congress always refused to appropriate for one. It was mainly due to the efforts of Capt. J. M. Gilliss, U.S.N., that the foundation of a Naval Observatory was finally laid. On 6 Dec. 1830 a bureau for the care of naval instruments and charts was established by the navy commissioners in the western part of Washington. Lieutenant Goldsborough, U.S.N., was the first officer in charge and in the small circular building built for the use of the depot he mounted the first instrument—a portable transit instrument of 30-inch focal length, made by Richard Patten of New York. In 1833 Goldsborough was succeeded by Lieutenant Wilkes, U.S.N., who removed the depot to a building on Capitol Hill on the west side of North Capitol street, between B and C streets north. This

building was 14 x 13 x 10 feet, and contained, besides the original instrument, a transit instrument of three and three-fourths-inches aperture and 63 inches focal length, a Borda's circle, a sidereal clock and a 3.5 foot achromatic portable telescope by Jones.

Systematic astronomical observations did not begin until 1838 when the Wilkes expedition started for the South Seas. In that year Wilkes resigned the superintendency to assume charge of the expedition and turned over the direction of the Naval Observatory to Gilliss. In the summer of 1838, by order of the Secretary of the Navy, Gilliss purchased a portable achromatic telescope of three and one-fourth inches aperture and 42 inches focal length, an Ertel meridian circle of four and five-tenths inches aperture, with circles 30 inches in diameter, one of which was graduated to three minutes, a sidereal clock and a mean time clock.

It was not, however, until 12 years after the founding of the Bureau of Charts and Naval Instruments (1830) that a suitable building was provided for use as a Naval Observatory. In 1842 an act was passed by Congress (approved 31 August) appropriating \$25,000 for such a building and as it had been mainly due to the efforts of Gilliss that the appropriation was made, he was directed to visit the principal observatories of America and Europe for information respecting plans. The building, occupying a site of 17.85 acres between 23d and 25th streets west, and from E street north to the Potomac, was completed in September, 1844, by Gilliss, and Lieutenant M. F. Maury, U.S.N., placed in charge. The instruments and clocks were removed from Capitol Hill and installed in the new buildings, and further equipment was purchased, consisting of a nine and six-tenths-inch achromatic equatorial, a meridian transit of five and one-third-inch aperture, a prime vertical transit instrument of four and nine-tenths-inch aperture, a mural circle with a telescope of four and one-tenth-inch aperture, and a circle five feet in diameter divided to five minutes and read by six micrometer microscopes, a comet seeker of four-inch aperture, magnetic and meteorological instruments and books. Berlin, Paris, Greenwich and Vienna observatories presented some 200 rare volumes as a nucleus for a library. This library has grown to one which now consists of 29,000 volumes and 5,800 pamphlets, and stands to-day second to Pulkowa only. The published observations comprise more than 50 large

quarto volumes. The *Nautical Almanac* Office was established in 1849 and in 1894 it became a department of the Naval Observatory and since then the *American Ephemeris* and *Nautical Almanac* has been issued as a part of the work of the observatory.

On 3 March 1849 Congress appropriated \$10,000 to pay Dr. Locke of Cincinnati for the construction and use of a magnetic clock, a fillet chronograph, and a cylinder chronograph, which at that time embraced the essential features of those now in use. On April 20, 1861, Maury resigned the superintendency, after having made hydrographic researches which have made his name famous. On the 23d Gilliss assumed charge of the Naval Observatory, instilling new life in the astronomical work and gradually raising the usefulness of the observatory as a national astronomical institution. Since August 1865, in accordance with the plan originated by Professor Harkness, the observatory has transmitted time signals daily except Sundays and holidays (since 1913, daily) over the telegraph lines running into the chronometer room. In 1865 a new Pistor and Martin's meridian circle of eight and fifty-two hundredths-inch aperture replaced the smaller Ertel circle and in 1873 the famous twenty-six-inch equatorial refractor by Alvan Clark and Sons was placed in position. At that time it was the largest refractor in existence, and with it Prof. Asaph Hall discovered the satellites of Mars in 1877.

In 1881 a new site on Georgetown Heights was purchased by Congress, appropriations for new buildings were made in 1886, and in the early part of 1893 the buildings were so far completed as to permit of the transfer of the instruments from the old building. The new buildings occupy a site of 67.78 acres on the heights about 275 feet above the Potomac River and comprise one office building and a number of detached buildings for the principal instruments. The main building has a tower for the smaller equatorial on its western end and still further west an adjoining meridian transit room, while on its eastern end is the library. The clockhouse with vault is 410 feet northwest of the main building and it is flanked on the east and west by connecting observers' rooms which contain the chronographs. Directly east of the east observer's room is the east transit house containing the 9-inch transit circle and directly west of the west observer's room is the west transit house containing the 6-inch transit circle. About 50 feet north of the clockroom is the prime vertical transit house and 175 feet south is the dome of the 26-inch equatorial with two rooms connecting for astronomers' use. Situated 275 feet northwest of the clockhouse is a sheet-iron building with movable roof for the alt-azimuth instrument and connected with it by a platform is another building of sheet-iron louvre work with removable roof for the photographic zenith tube. The horizontal photoheliograph is mounted 400 feet southeast of the clockhouse and about 200 feet southeast of photoheliograph is the photographic equatorial building. The main building, the 26-inch equatorial building, the clockhouse with the adjoining observers' rooms are of white marble, but the other buildings are largely of metal.

In regard to equipment, the 9.6-inch equatorial refractor has been replaced by a telescope having a 12-inch object glass made by Clark and mounted by Saegmüller and occupying a 26-foot dome on the tower at the west end of the main building. The 26-inch equatorial is provided with a mounting by Warner and Swasey and a filar micrometer of the highest grade furnished by the Repsolds. This micrometer is constructed of iron and steel and provided with a printing arrangement for registering the settings of the micrometer screw. The dome is 45 feet in diameter and the hydraulic elevating floor has a range of motion of 12 feet. The 4.5-inch Ertel transit is mounted in the meridian transit house at the west end of the main building. The 8.5-inch object glass of 12 feet focal length in the Pistor and Martin's meridian circle was replaced by a 9.14-inch Clark object glass of 107 inches focal length and the instrument was otherwise modified. Other instruments added to the equipment are; a steel meridian circle with a 6-inch object glass provided with two circles 26 inches in diameter graduated to two minutes; a steel alt-azimuth with a 5-inch object glass by Warner and Swasey, the diameter of its vertical and horizontal circles being 26 inches each, graduated to two minutes; a photographic equatorial with a pair of 10-inch photographic lenses which were figured at this observatory and placed in the central part of the old mounting of the 26-inch equatorial, the 9.6-inch telescope being used for guiding purposes; in 1915 the International Geodetic Association loaned the naval observatory their 8-inch photographic zenith tube which was used for the determination of variation of latitude. This instrument has been set up and continuous observations are being made with it.

The following continuous routine astronomical work is now being carried on at the naval observatory; the 6-inch and 9-inch transit circles are being used to determine the positions of the fundamental and intermediary stars suggested by the Permanent International Committee on the Photographic Chart of the Heavens; the series of observations 1893-1912 made with the prime vertical transit instrument for the determination of the nutation constant, the aberration constant and the variation of latitude are being discussed and prepared for publication; the equatorial telescopes are used principally for the observation of the satellites of the planets, comets, asteroids and the occultations of stars by the moon; the alt-azimuth is being used for the determination of the declinations of fundamental stars; the photographic zenith tube is used for the measurement of variation of latitude; the photographic equatorial is devoted to systematic observation of a zone of asteroids; and daily photographs of the sun are being taken with the photoheliograph. Consult Skinner, 'The United States Naval Observatory' in *Science* (Vol. IX, pp. 1-16, 6 Jan. 1899); Chester, 'Work of the Naval Observatory' (Proceedings of the United States Naval Institute, Vol. XXX, pp. 265-288, June 1904); Nourse, 'Memoir on the Founding and Progress of the U. S. Naval Observatory' (Washington Observations, 1871, Appendix IV).

NAVAL ORDER OF THE UNITED STATES, an association composed of a General Commandery and commanderies in the States of Massachusetts, Pennsylvania, New York and Illinois and in the District of Columbia. The General Commandery meets triennially on 5 October, and the State Commanderies meet annually in November. The parent commandery, that of Massachusetts, was organized at Boston on 4 July 1890. The General Commandery was established three years later, on 19 June 1893. The members of the order are officers and the descendants of officers who served in the navy and marine corps in any war or in any battle in which the said naval forces of the United States have participated. It has about 500 members.

NAVAL RESERVE. See **NAVAL MILITIA**.

NAVAL SCHOOLS, institutions for the training of naval officers. In the United States the Naval Academy at Annapolis, Md., is the most important school of this character. In Great Britain the chief naval school is the Royal Naval College at Greenwich. See **NAVAL ACADEMY, UNITED STATES**.

NAVAL SIGNALS. See **SIGNALS, NAVAL**.

NAVAL STORES, or SHIP STORES, a general term used in commerce and in the merchant marine, for certain products of the pine tree, including spirits of turpentine, resins, pitch, tar, etc. The term is a misnomer in these days of steel and iron ships, as nine-tenths of the product are used in other industries rather than in shipping. The name naval stores is derived from the consumption in early days of large quantities of pitch and tar in ship yards and on board of vessels. Nine-tenths of the naval stores used throughout the world come from the long-leaved pine belt of the Southern States. The pine belt includes a vast territory commencing in North Carolina, near the Virginia State line, and extending southward to Florida, along the Atlantic Coast line. The belt is from 5 to 100 miles wide and includes the States of North Carolina, South Carolina, Georgia, Alabama, Mississippi and Louisiana. The territory embraces about 130,000 square miles. The other tenth of the world's supply comes from France and Austria.

Turpentine.—Spirits of turpentine is derived from the sap of the long-leaved pine and in its crude state is of a fine white color. Upon exposure to the air it becomes dry, hard and brittle, thus forming resin. From 200 acres of pine trees there is obtained the first year about 280 barrels of crude turpentine, or dip; and 70 barrels of what is known as scrape. This distilled will give 2,000 gallons of spirits of turpentine and 260 barrels of resin. In the fourth and last year of the sap flow this output is reduced to 1,000 gallons of turpentine and 110 barrels of resin. By a later process of wood distillation the old dead tree-logs may be made to yield large quantities of resin, tar and turpentine. In the days of the Civil War turpentine sold at \$1.75 to \$1.90 a gallon, as against the normal price of 28 or 30 cents; and inferior resin sold as high as \$4 a barrel, the normal price being about \$1.90. These Civil War prices were largely duplicated in the time of the Great World War when the building of many wooden ships called for increased quantities of tar. See **TURPENTINE**.

Pitch.—The ordinary pitch of commerce is

derived from a dry distillation of resin, and is largely used in calking wooden ships. See **TAR**.

Tar.—The variety of tar known as wood tar which is made from the pine sap (see **TAR**) is produced almost entirely in North Carolina. A cord of pine wood will produce 40 gallons. Wilmington, N. C., is the headquarters for the world's supply of tar and crude turpentine.

Statistics.—The city of Savannah, Ga., is one of the largest markets in the world for naval stores. These form a large share of the foreign commerce of the city, which before the war totaled \$70,000,000 annually.

NAVAL TACTICS. Before hostile fleets are brought into contact (this word indicating the dividing line between tactics and strategy) there are a number of questions to be decided, covering the whole plan of operations throughout the theatre of war. Chief among these are the proper function of the navy in war; its true objective; the point or points upon which it may be concentrated; the establishment of supply and coal depots; the maintenance of communications between the home base and these depots; the military or naval value of commerce-destroying as a secondary operation of war and how it can be most efficiently conducted. All these are strategic questions and it is particularly in the field of naval strategy that the teachings of the past have a value as illustrative of principles and as precedents. This is less true as to tactics when the fleets come into collision at the point or points to which strategic considerations have brought them.

The fighting order of navies is a line, which is called more properly a column because the ships are ranged one behind the other. If the arrangement of the guns, from van to rear, is regarded it will be seen that they really are deployed on a line fronting the enemy. It is commonly known as an attack on van or rear, because of the columnar formation of the ships, but it is really a flank attack. Whichever flank is chosen, the attack on the other is essentially refused, because the numbers devoted to it are insufficient to press an attack home. The culmination of the sail era—Trafalgar—was fought on these lines. Nelson was a thoughtful and daring tactician and expressed reasons for attacking one flank rather than another, under different conditions in which the fleets presented themselves; but, speaking generally, the rear was the better to attack, because the van could not come as soon to help the rear as the rear could the van. There are two primary elements of naval strength, one purely defensive and the other equally offensive. The defensive element comprises well fortified bases sufficiently equipped for the service of the fleet and strategically located; an efficient home base of supplies; sufficient merchant tonnage to serve the needs of war; the protection of all lines of communication to strategical bases and the successful patrol of important trade routes; and the efficient control of all these activities by a system of quick and ready communication. The offensive element is the fleet which must be "well rounded out," comprising capital ships (battleships and battle cruisers), scouts, destroyers, mine layers, submarines, aeroplanes, airships and auxiliaries. It must be trained, adequately manned with trained men, have its

magazines well stocked with ammunition, its storerooms and fuel spaces filled for weeks or even months should it be necessary to wait upon the high seas for its opponent. The battleship of to-day is the lineal descendant of the "Triremes" of Actium and the "Ships-of-the-Line" of Trafalgar and is intended to play the principal rôle in naval warfare. It carries guns of the largest calibre, is protected by steel armor and is regarded as the embodiment of the sea power of a nation. In a modern fleet the following types of ships should exist in co-operation with the battleships: battle cruisers, armored cruisers, protected cruisers, scout cruisers, destroyers, submarines, repair ships, ammunition ships, supply ships, fuel ships, destroyer tenders, submarine tenders, hospital ships, mine depot ships, mine-laying ships, gunboats, tugs and miscellaneous craft. The battle line, composed of those vessels upon which the maximum calibre guns are mounted contains the concentrated fighting strength of the nation. By many naval strategists the true solution of the service of security and information for the fleet lies in utilizing only vessels that can lie in the battle line. This reduces scouting to a limited area about the fleet. This theory decides against scout cruisers unless their usefulness in the tactical battle line can be proved valuable. England and Germany have successfully employed scout cruisers for mine laying and to support destroyers in an attack upon the enemy battle line. The battle line must not be shorn of gun power. The solution is to sacrifice armor for speed in the types of ships to be used as scouts.

Naval operations, excepting raids against coast defenses, presuppose naval superiority by the attacker. Such operations may include one or more of the following: blockade, reconnaissance, demonstration, raid, bombardment and run-by. No matter how complete and detailed may be the information with which a naval commander is supplied when operations are projected, it must be verified and brought up to date by reconnaissance. The information usually desired is the location of batteries, searchlights, stations and mine fields, arcs of fire, range and dead angles of batteries, landing places for troops, and to locate and chart landmarks for aiming points and compass courses. Reconnaissances may be made by day or night, at close or long range, and may be preliminary or in force. The latter are made when the coast defense commander will not disclose information in any other way. Reconnaissances usually begin at long range, with the hope of getting the desired information at small cost. A demonstration has for its object, to harass and wear out the garrison, to force expenditure of ammunition, or to cover some other operation. Raids are attacks upon more or less exposed elements of the defenses, such as mine fields, obstructions, stations, searchlights and detached batteries. A bombardment is an attack upon the fortifications with intent to destroy or seriously cripple them, with a view to a run-by, wherein the fleet or a part of it forces its way past the fortifications and attacks the city, naval base or fleet they protect. The tactical grouping of armament is made to obtain its most prompt and powerful destructive effect in action. Tactical control begins with the fortress commander, and ex-

tends down through fire and battery commanders to the individuals. It depends to a large extent upon efficiency of communications, which fact is recognized by making the battery the basic tactical unit and providing a general defense plan for use when communications fail. The employment of the armament in defense against all forms of attack will depend upon many conditions, one of the chief being the state of the ammunition supply and the possibility of replenishing it. The fortress commander must be able to analyze quickly and accurately the intentions of the fleet commander, and must employ all the force necessary to defeat them, keeping the fleet at a respectful distance with his mortars, and disclosing the least possible information consistent with defeating the enemy's intentions. Unless he has an ample ammunition supply, he must conserve his ammunition and make each shot count. He must be able to determine quickly which is the main effort of the hostile fleet and concentrate all necessary armament upon it. He must know the power of his armament and the general character of the ships he is attacking in order to assign his armament most usefully.

There are two general methods by which battle control may be exercised: The general defense plan and the individual control. The general defense plan seems simple, and is easily and quickly put into operation. It is well thought out long in advance, and carries written instructions. But it is difficult to decide in advance just what the enemy will do, so although the general defense plan is valuable and important, it can be considered only as subsidiary to individual control, which is the proper and correct way to exercise battle tactics. The fortress commander estimates the situation, decides upon the intentions of the enemy, and gives appropriate orders to the fire commanders, and during the course of the action gives such additional orders as the changes in the situation warrant. Long-range actions are now the predominant feature of all naval engagements. During the Russo-Japanese War, the stronger party, as a rule, forced a decision at short range, while now the endeavor is made to strike the decisive blow at long ranges. To accomplish this, advantage is taken of superior speed and greater range of guns. Such tactics are based upon the experiences from the Japanese War, and have been confirmed during the European War. A ship can be put out of action solely by shell-fire, which ruins its power of navigation, destroys its fire-control apparatus, and ravages the whole ship with fire and explosions. The fight off the Falkland Islands illustrates this in a very distinct manner. Thus it would appear that the battle cruiser, which, with superior speed, is able to force the engagement at long range, has a good chance against the "dreadnought," whose heavier armor protection is of no added advantage at such ranges. Admiral Rojestvensky said, after the Russo-Japanese War, that the deadliest enemy of the battleship was the wall of fire created by the incessant bursting of projectiles. The European War has largely confirmed his opinion. In most reports expressions like "the vessel caught fire, later on followed by explosions," can be read. It must be borne in mind, however, that the

more important ships which were sunk by fire during this war were of an older date and have not benefited from the experiences obtained during the war as to the value of the fire-extinguishing apparatus. In spite of all technical progress and care in the manufacture of ammunition there seems to have been a considerable number of non-bursts, although the percentage is smaller than during the Japanese War, where it is reported to have been 65 per cent. As on land, a characteristic feature of war on sea is the huge consumption of ammunition, which far exceeds all calculations. The effect of high explosive shells bursting within 10 metres of the ship's bottom is said to be as dangerous as a direct hit below the water line. High water-columns around a vessel caused by bursts on impact make the gunlayer's task a difficult one. The indirect fire of the *Canopus* off the Falkland Islands, and of the *Queen Elizabeth* at the Dardanelles, shows that long-range fire, in connection with aeroplanes and balloon observation, is a great advantage. The lack of success in the naval operations on the coasts of the Adriatic and the Aegean resulted from the fact that ships of war are constructed and armed primarily to fight other ships and not to reduce permanent sea-coast defenses; their proper functions in the former operations are those of convoy, bombardment, disembarkation, blockade and the like. All military technical literature shows that ships cannot contend successfully with high shore batteries. Ships are not armed to execute high angle fire. Their armament is of three kinds: large calibre for use against heavy armor; medium calibre for use against light armor and superstructure; and small calibre for use against minor craft. The life of the large guns is very limited. No mortars or howitzers are carried. To bring curved fire to bear on coasts' forts it is necessary for ships either to fire from a long distance with their greatest permissible angles of elevation or to come in close to the shore, drop anchor and give the vessels a list sufficient to secure the required elevation of the guns. In the first case the fire will be inaccurate and in the second the ships will be exposed to the danger of very effective short range fire from the forts and also of going aground. The best way to resist an operation of disembarkation and bombardment is with a fleet acting offensively against the hostile fleet. If this is not possible recourse must be had to mobile forces sent to the threatened point.

After sufficient strategical and tactical scouting, the actual battle between the two battle lines will begin with a long range duel; first with battle cruiser, as in the recent Jutland engagement, and afterward battle line against battle line, the battle cruisers leading their battle lines and protecting its head from destroyer attack. Destroyers, supported by scout cruisers, dash in against the head of their enemy's column after it is under the gunfire of the opposing battle line. From this point on each force, without orders and often without signal, carry out a prearranged tactical battle plan, the part each type is to play having been studied during the years of peace before the war began. The object of battle is to seek position and strike. Tactics is used to seek position in order to strike. Gunnery does the striking. It is always difficult to define clearly naval strategy and tactics, yet these must be

clear in mind before the principles of naval war can be grasped. Strategy in distinction from tactics may be said to be the field of war from the point of view of one wishing to attain an object, while tactics is the field of war from the point of view of the executor. Strategy is the idea seeking materialization, a thought seeking its means of execution, while tactics gives the materialization of the idea and the means of carrying out the desires or wishes of the thought. Tactics is the servant of strategy in all naval operations, and a tactical problem without a strategical setting is like a quotation without the context.

EDWARD S. FARROW,

Consulting Military and Civil Engineer.

NAVAL VETERANS, National Association of, a patriotic society founded by delegates from the various associations of naval veterans throughout the Union at a meeting held in the city of New York, in January 1887.

Any officer, appointed or enlisted man who has served in the United States navy, United States Marine corps or United States Revenue Marine service during any portion of the time between 12 April 1861 and 25 Aug. 1865, who has not borne arms against the United States, or been convicted of any infamous crime, and who has been honorably discharged or resigned by an honorable acceptance of resignation, is eligible to membership in this association. There are local associations under the national charter, a paid membership of about 7,000, and 3,000 contributing members.

NAVAL WAR COLLEGE, United States. See NAVAL ACADEMY, UNITED STATES.

NAVARINO, nä-vä-rē'nō, or **PYLOS**, pī-lōs, Greece, a seaport town on Navarino Bay, on the southwest coast of the Morea. Its official name is Pylos (q.v.), ancient Pylos, the city of Nestor, now called Palæokastro and Palæo-Navarino, being at the north extremity of the bay. The Bay of Navarino was the scene of a great sea fight between the Athenians under Cleon and the Spartans, 425 B.C. From 1492 to 1821, the town was in the possession of the Turks, when it was taken by the Greeks. The Turks recaptured it in 1825, and retained it until on 20 Oct. 1827 in Navarino Bay the Turkish and Egyptian navy of 89 ships was annihilated by 24 ships of the combined British, French and Russian fleets under Sir Edward Codrington, the British admiral, and brought about Greek independence. Pop. (est.) 3,000. Consult 'Memoir of Sir Edward Codrington,' by his daughter (1873); Baedeker, K., 'Greece' (4th Eng. ed., Leipzig 1909).

NAVARRE, na-vär' (Sp. *Navarra*), Spain, a northern province, formerly, with a portion of the department of Basses-Pyrénées, France, constituting the ancient kingdom of Navarre. The province has an area of 4,055 square miles; the surface generally is mountainous and bleak, but in the valleys, and along the river banks, the soil is fertile, producing wheat, maize, barley and oats. The principal rivers are the Aragon, Argá, Ebro and Bidassoa. The mineral wealth comprises iron, copper and rock salt. The chief towns are Pamplona, the capital, Tudela, Olite and Estella. Pop. of province 316,914. Navarre was inhabited at an early period by the Vascones, the progenitors of the Basques and Gascons. The Vascones were expelled by

the Romans. It was seized by the Visigoths in 470, invaded by the Saracens early in the 8th century, and fell under the sway of Charlemagne in 778. It became an independent state in 855. In 1035 Navarre was divided into three kingdoms—Navarre, Aragon and Castile. The first two became united in 1076, and again separated in 1134. In 1285 it became an appanage of France, but recovered its independence in 1328. Ferdinand conquered it in 1512. The estates of Navarre took the oath of allegiance to him in 1513, and it was incorporated with Castile in 1515. After this act of spoliation, there remained nothing of the ancient kingdom of Navarre beyond a small territory on the north side of the Pyrenees, which was subsequently united to the crown of France by Henry IV of Bourbon, king of Navarre, whose mother, Jeanne d'Albret, was granddaughter of Queen Catherine; and hence the history of Navarre ends with his accession to the French throne, in 1589, the French monarchs, however, until Charles X, being called also King of Navarre. Consult Bordenave, Nicholas de, 'Histoire de Béarn et Navarre' (Paris 1873); Lagrèze, G. B. de, 'La Navarre française' (2 vols., ib. 1881-82); De Oloriz, Hermilio, 'Resumen historico del antiguo reino de Navarra' (Pamplona 1887); De Moret, José, 'Anales del reino de Navarra' (9 vols., Toulouse 1892); Jaurgain, Jean de, 'Etude historique et critique sur les origines du royaume de Navarre' (Paris 1897); id., 'La Vasconie' (ib. 1898).

NAVARRETE, nă-văr-ră'tă, **Juan Fernandez**, Spanish painter: b. Logroño, about 1526; d. Toledo, 1579. He was known as "El Mudo," the mute, being deaf and dumb. He imitated the monk painter of the Milanese school, Fra Vicente; he then devoted himself almost entirely to the study of Titian, whose style and coloring he reproduced so successfully that he became known as the "Spanish Titian." Philip II appointed him his court painter and much of this artist's best work was done in decorating the Escorial. Titian's influence is evident in a 'Birth of Christ'; a 'Holy Family'; and a 'Scourging of Christ' in the Escorial (1571-75), which have exercised a profound influence on the development of technique in Spanish painting.

NAVARRO, na-văr'ō, **Madame**. See ANDERSON, MARY ANTOINETTE.

NAVARRO, Nicolás Eugenio. Venezuelan educator: b. Margarita, Venezuela, 14 Nov. 1867. He was educated at the Episcopal School and the Central University of Caracas; was ordained to the Catholic priesthood in 1890 and for nine years was engaged in parochial duty in the archdiocese of Caracas. From 1902 to 1905 he was professor of dogmatic theology and Sacred Scripture and since the latter year has served as rector and professor at Central University, Caracas. He was sent abroad by the Venezuelan government to obtain a foundation of Capuchin friars for Venezuela. During the anti-religious manifestations of 1896 he was an able defender of the religious orders. In 1899 he accompanied Bishop Duran as secretary to the Plenary Council of Latin America, at Rome, and in 1912 accompanied Archbishop Castro to the Eucharistic Congress at Vienna. In 1911 he was nominated deputy to the Congress of Municipalities in celebration of the

centenary of the independence of Venezuela. He published 'Tres refutaciones con motivo de otras tantas conferencias patrocinadas por la Masonería de Caracas'; 'El incidente del Asilo de providencia'; 'Los conventos y las garantías constitucionales de los Venezuelanos'; 'Editoriales en La Religion'. He is director of *La Religion*, and is a contributor to *Anales de la Universidad Central*; the *Cojo Ilustrado*, and to 'The Catholic Encyclopedia.'

NAVARRO, Pedro, Spanish general: b. Spain, 1446; d. Naples, Italy, 1528. He was engaged with Gonsalvo de Cordova in the Naples campaign of 1500 and made such skilful use of mines as to influence largely the outcome of the war. For this service he was created Count of Alvetto and given command of a naval expedition against the Moors. He was taken prisoner by the French in 1512 and despairing of being ransomed he joined the French army. In an attack upon Naples he was again captured and died soon after. Consult 'Martín de los Heros' in 'Colección de documentos inéditos para la historia de España' (Vol. XXV, Madrid 1854).

NAVAS DE TOLOSA, Las, lās nă-vās dā tölō'sā, Spain, a village of Jaen province, 38 miles by rail north of Jaen, which owes its celebrity to the defeat near here of the Moorish army under Mohammed ibn Abdallah 16 July 1212, by the Spanish troops commanded by Alfonso VIII, assisted by an army of French and English crusaders. In the vicinity also, a battle was fought between the Spanish and French in 1812.

NAVASOTA, năv'a-sō'ta, Tex., city in Grimes County, on the Navasota River, near its outflow into the Brazos River and on the Houston and Texas Central and the Gulf, Colorado and Santa Fé railroads, 70 miles northwest of Houston and 29 miles south-southeast of Bryan. It has a substantial city hall and high school, the Atchison Institute, wagon factory, cooperage, creamery, oil-mill, etc. Pop. (1920) 5,060.

NAVASSA, nă-vă'sā, West Indies, a small island off the southwest coast of Haiti; about two miles long and one and one-half miles wide; altitude, 300 feet. High bold cliffs border nearly all the shore. In 1857, Peter Duncan, an American, discovered on this island a deposit of guano estimated to amount to 1,000,000 tons. According to an act of Congress, passed 18 Aug. 1856 relative to the discovery of guano deposits on unclaimed islands, it was decided that the island of Navassa should be considered "as appertaining to the United States." Consult D'Inwilliers, 'Phosphate Deposits of the Island of Navassa' in *Bulletin of the Geological Society of America* (Vol. II, pp. 75-84, 1891).

NAVE, in Gothic architecture, that part of an ecclesiastical edifice to the west of the choir, and in which the congregation assemble; the part of a church between the aisles.

NAVESINK (năv'ē-sink) **HIGHLANDS**, a low range of hills, in Monmouth County, New Jersey, south of Sandy Hook, and at the mouth of Navesink River. Mount Mitchell, the highest point, is nearly 300 feet above sea-level. On an elevation, 195 feet, stands a lighthouse with two towers 100 feet apart and 53 feet in height. In each tower is a fixed white light.

The Highlands are an important landmark to ships approaching "The Narrows," and the region in this part of New Jersey is a favorite resort for residents of New York.

NAVICULAR DISEASE. See HORSE, CARE AND DISEASES OF THE.

NAVIDAD, La, *lā nā-vē-dād'*, the name of a fort built by Columbus in 1493 on the coast of Haiti, and which was the first Spanish settlement in the New World. Here he left a company of between 30 and 40 men, but on his return in November of the same year found they had all been killed by the Indians and the fort destroyed. See COLUMBUS.

NAVIGABLE RIVERS. See RIVERS.

NAVIGATION. Navigation comprehends that branch of knowledge by means of which the geographical position of a ship is ascertained and kept account of throughout a voyage. It enables a mariner, come from the other side of the world, to steer his ship for the port of destination before ever it has hove in sight. The subject is usually discussed in two parts, called respectively Navigation and Nautical Astronomy.

Navigation, in the limited sense, treats of determining the position of the ship by means of measurements made with reference to the terrestrial surface. It comprises "piloting," the process of conducting a ship in channels and harbors and along coasts where landmarks and aids to navigation, like lighthouses, beacons and buoys, are available for fixing position and where the depth of water and the dangers to navigation are such as to require a constant watch to be kept upon the ship's course and frequent changes of heading to be made, and "dead reckoning," the art by which the geographical position at any moment is deduced from the direction and amount of the ship's progress from a point of departure whose latitude and longitude are known.

Nautical Astronomy is that part of navigation, in its comprehensive sense, which treats of determining the geographical position of the ship from observations of celestial bodies. As the method of piloting cannot be employed out of sight of land, the navigator at sea must find his geographical position either by dead reckoning or by the observation of the sun, moon, planets and stars; the latter method is the more exact, but, since it is not always available, the former must often be depended upon.

Of fundamental importance in navigation is the nautical chart—a miniature representation upon a plane surface, in accordance with some definite system of projection or development, of a portion of the navigable waters of the world. It generally includes the outlines of the adjacent land, together with the surface forms and artificial features that are useful as aids to navigation, and sets forth the depths of water, especially in the near approaches to the land, by soundings that are fixed in position by accurate determinations according to the methods of hydrography. Except in charts of harbors or other localities so limited that the curvature of the earth is inappreciable on the scale of construction, a nautical chart is always framed over with network of parallels of latitude and meridians of longitude, in relation to which the features to be depicted on the chart are located and drawn, and the mathematical

relation between the meridians and parallels of the chart and those of the terrestrial spheroid determines the method of measurement that is to be employed on the chart and the special uses to which it is adapted. A navigator, piloting his ship in sight of objects whose locations are shown upon the chart, may determine position by (a) corrected cross-bearings observed by compass upon two known objects, (b) the distance and corrected compass bearing of a known object, (c) the corrected compass bearing of a known object and the angle measured by sextant between two known objects, (d) two compass bearings of a known object separated by an interval of time together with the compass course and the distance passed over by the ship during that interval, (e) angles measured by sextant between pairs of three known objects. Although the choice of method is governed by circumstances, the resulting position is always found by plotting on the chart. Finally, in connection with the identification of the ship's position by means of the chart, the useful application may be mentioned of taking soundings by means of the lead and line and noticing the correspondence of the charted depths with the series of observed soundings. In some parts of the ocean, even many miles from land, quite serviceable locations result from this practice. Specimens of the materials of the ocean bottom can also be brought up by filling a recess in the end of the sounding lead with grease to which such materials will adhere, and, at times, these specimens also afford information of value, for the charts always specify the kind of bottom existing in various parts of the ocean.

Positions ascertained by dead reckoning are usually less exact than those determined by bearings or angles upon terrestrial objects, as well as those determined by observations of celestial bodies, because the accuracy of dead reckoning is affected by the imperfections arising in determining the precise direction and distance sailed. The deduced course and distance may differ from the course and distance actually made good by reason of bad steering, faulty estimates of the speed, unknown currents, and outstanding errors in the deviation of the compass caused by the ship's magnetism and in the variation of the compass caused by the earth's magnetism. Notwithstanding these recognized defects, dead reckoning is an invaluable aid to the mariner, affording him a means of plotting the position of the ship at any desired time in the interval between astronomical observations for finding geographical position; furnishing an approximate position at the moment of taking astronomical observations and thus proving to be a great convenience in computations based upon those observations; and finally, affording the only available means of determining the location of a ship at sea during those periods of clouded sky, often several days in duration, when the observation of celestial bodies is precluded. The beginning of dead reckoning, called "taking a departure," consists in finding the position of the ship before losing sight of the land and preferably while natural and artificial objects remain in good view, by the methods of piloting, and then using the latitude and longitude of this position, obtained from the plottings on the chart, as the origin for dead reckoning; or

else, as in cases where the bearing and distance of an object on land of known latitude and longitude has been chosen, using the position of this object as the origin of reckoning and the reversed direction of the bearing, with the distance, for the first course and distance, thus treating the proceeding as if the ship had started from the object on shore and sailed to the position where the bearing was taken. Each time that a new position is determined, the taking of the departure is performed anew.

A complete record of data appertaining to the navigation of the ship is kept in a journal called the logbook. The various compass courses along which the ship has advanced from the point of departure are set down in a column, and aside of each, in adjacent columns, are written the values of the deviation and the variation by which the compass course is corrected to find the true course of the passage, and, yet further, aside, of each true course, the distance which the vessel has advanced in that direction. With each true course enter the traverse table—a tabulation, for the values from degree to degree of the acute angles of a plane right-angled triangle, of the relative lengths of the hypotenuse (called distance), the side opposite the tabular angle (called departure), and the side adjacent to this angle (called difference of latitude)—and find in the distance column of the table, opposite to the value of the distance given by the dead reckoning, the corresponding values of the departure and the difference of latitude. These are written in four appropriate columns annexed to the dead reckoning form to the right of those above mentioned. These columns are headed Northing, Southing, Easting and Westing, in order to classify the differences of latitude according to whether the advance of the ship has been to the northward or to the southward upon the course considered, and the differences of departure according to whether the advance of the ship has been to the eastward or westward. When the position of the ship is required, add up all the northings and all the southings and subtract the lesser sum from the greater to obtain the resultant difference of latitude to the northward or the southward, and also add up all the eastings and all the

westings and subtract the lesser of these sums from the greater to obtain the resultant departure to the eastward or the westward, and hence the difference of longitude to the eastward or the westward. Since the number of nautical miles in the departure is equal to the product of the number of minutes of arc in the difference of longitude multiplied by the cosine of the middle latitude of the traverse, the conversion of departure into difference of longitude may be, and usually is, made by means of the traverse table—entering the table with the middle latitude in the place of the angle of the course and, opposite to that number in the latitude column which equals the number of miles of departure, finding the difference of longitude in the distance column.

Then the difference of latitude is applied to the latitude of the last determined position or point of departure, which will give the latitude by dead reckoning. With the middle latitude, find the difference of longitude corresponding to the departure, and, applying this to the longitude of the last determined position or point of departure, the result will be the longitude by dead reckoning. The process is illustrated by the following example:

On 3 April 1918, at 1 P.M., took departure, Cape Henry Lighthouse (lat. 36° 55' 35" N., long. 76° 00' 27" W.) bearing (per ship's compass) 293°, distant 10 miles, ship's head east (p. s. c.); deviation 3° E., variation from chart 6° W. Thence ran till 8 A.M. next day as follows. Required the course and distance by D. R. from the lighthouse, and the latitude and longitude of the position reached:

COURSES (p.s.c.)	Distance	Dev.	Leeway	Wind
73°	60	+3°	3°	Nly
118°	20	+6	3	Nly and Ely
160°	10	+3	3	Ely
319°	10	-6	3	Nly and Ely
26°	130	+3	3	Sly and Ely

To illustrate the application of the various corrections, each course will be considered separately, and corrections applied one at a time, though in practice the algebraic sum is applied mentally.

DEPARTURE COURSE					1st course	2d course
Bearing of Lt. (p. c.)	293°	Course (p. c.)	73°	118°	73°	118°
Deviation	+3	Leeway	+3	+3	+3	+3
Magnetic bearing	296	Course through water	76	121	76	121
Variation	-6	Deviation	+3	+6	+3	+6
True bearing of Lt.	290	Magnetic course	79	127	79	127
Departure course	110	Variation	-6	-6	-6	-6
		True course	73	121	73	121
		3d course	4th course	5th course		
Course (p. c.)		160°	319°	26°		
Leeway		+3	-3	-3		
Course through water		163	316	23		
Deviation		+3	-6	+3		
Magnetic course		166	310	26		
Variation		-6	-6	-6		
True course		160	304	20		

Having corrected the various courses, enter them in a traverse form and proceed with the solution.

The whole data should be in the tabulated form, and the above corrections would be made mentally, in ordinary practice.

or to have the means of measuring the distance she might sail, unless he should find methods independent of the dead reckoning for ascertaining his geographical position at sea. In this condition astronomy is ready to assist him and to afford him the means by which his latitude

WIND	Courses (p. s. c.)	Var. W.	Dev.	Leeway	True courses	Distances
Nly.....	73°	—6°	+3°	3°	110°	10
Nly and Ely.....	118	—6	+6	3	73	60
Ely.....	160	—6	+3	3	121	20
Nly and Ely.....	319	—6	—6	3	160	10
Sly and Ely.....	26	—6	+3	3	304	10
					20	130

Difference of latitude		Departure	
N.	S.	E.	W.
.....	3.4	9.4	
17.5		57.4	
.....	10.3	17.1	
.....	9.4	3.4	
5.6			8.3
122.2		44.5	
145.3	23.1	131.8	8.3
23.1		8.3	
122.2		123.5	
		D. Long.	
		156.6	

Lat. left = 36° 55' 35" N.
Difference in lat. = 2° 02' 12" N.

Lat. in = 38° 57' 47" N.

Long. left = 76° 00' 27" W.
Difference in long. = 2° 36' 36" E.

Long. in = 73° 23' 51" W.

The true course and distance made good may be found by entering the traverse table with the resultant departure, 123.5, and difference of latitude, 122.2, and finding the corresponding course, 45°.3, and distance, 173.7 nautical miles.

Supposing the voyage to be directed to Nantucket Lightship, in lat. 40° 37' 05" N. and long. 69° 36' 33" W., the true course and distance to that destination may now be determined:

Lat. of Nantucket Lightship.....	40°	37'	05" N.	Long. of Nantucket Lightship.....	69°	36'	33" W.
Lat. in.....	38°	57'	47" N.	Long. in.....	73°	23'	51" W.
Difference in lat..... =	1°	39'	18"	Difference in long..... =	3°	47'	18" E.
		99'.3		Middle long..... =		227'.3	
Middle lat.....	39°	47'	26"				

Converting this difference of longitude into departure, by entering the traverse tables with the middle latitude, 39° 47' 26", in place of a course, and the difference of longitude 227' .3, in the distance column, the number in the latitude column shows the departure to be 174.6 nautical miles.

The difference of latitude, 99.3', and the departure 174.6, found in juxtaposition in the traverse tables, indicate the true course to be 60½ degrees and the distance 201 nautical miles. Or, the same result may be found by measurement of the length, by the latitude scale, and the direction, with reference to the meridian lines, of the straight line drawn upon the nautical chart from the geographical position marked by the latitude and longitude by dead reckoning to the position of the representation of Nantucket Lightship.

But it would be of imperfect avail to the mariner to know the course which his vessel may make with respect to the sphere,

and longitude may be ascertained for the purpose of defining his position on the globe. The improvement of the instruments, the methods and the tables of nautical astronomy have been the constant solicitude of many generations. The altitude or angular distance above the visible horizon where the sea and sky meet may be accurately measured by means of the sextant, an instrument for measuring the angle between two objects by bringing into coincidence at the eye of the observer rays of light

received directly from the one and by reflection from the other, the measure being afforded by the inclination of the reflecting surfaces. By reason of its small dimensions, its accuracy, and, above all, the fact that it does not require a permanent or a stable mounting but is available for use under the conditions existing on shipboard, it is a most important instrument for the purposes of the navigator.

At the instant of taking an observation of altitude, the time at the meridian for which the ephemerides of the celestial bodies are tabulated must become known; and this is given by the chronometer, a portable timepiece of superior workmanship, differing from an ordinary watch

in having the force of its mainspring rendered uniform by means of a variable lever. Owing to the fact that on a sea voyage a chronometer is exposed to many changes of temperature, it is furnished with an expansion balance, formed of a combination of metals of different expansive qualities, which produces the required compensation. In order that its working may not be deranged by the motion of the ship in a seaway, the instrument is carried in gimbals. As the regularity of the chronometer is essential for the correct determination of a ship's position, it is of the greatest importance that every precaution be taken to ensure the accuracy of its indications. There is no more certain way of doing this than to provide a vessel with several of these instruments—preferably not less than three—in order that if an irregularity develop in one, the fact may be revealed by the others. The *American Ephemeris and Nautical Almanac* is divided into three parts as follows: Part I, Ephemeris for the meridian of Greenwich, gives the ephemerides of the sun and moon, the geocentric and heliocentric positions of the major planets, the sun's co-ordinates and other fundamental astronomical data for equidistant intervals of Greenwich mean time; Part II, Ephemeris for the meridian of Washington gives the ephemerides of the fixed stars, sun, moon and major planets for transit over the meridian of Washington, and Part III, Phenomena, contains predictions of phenomena to be observed with data for their computation. Tables are also appended for the interconversion of mean and sidereal time and for finding the latitude and azimuth by an altitude of Polaris.

The *American Nautical Almanac* is a smaller book made up of extracts from the "Ephemeris and Almanac" just described, and is designed especially for the use of navigators, being adapted to the meridian of Greenwich. It contains the position of the sun and moon, together with the ephemerides of the planets Venus, Mars, Jupiter and Saturn, and the apparent places of 55 stars for the first of each month and the Greenwich mean time of transit at Greenwich for each of these stars, also the mean places of 110 additional stars; solar and lunar eclipses are described, and the tables for the interconversion of mean and sidereal time and for finding the latitude by Polaris are included.

The elements dependent upon the sun and moon are placed in the first part of the book, arranged according to hours, days and months of the year. The right ascension of the mean sun for the entire year is given at one opening, also the mean time of sidereal noon at Greenwich; the declination of the sun, equation of time, the right ascension and declination of the moon and the moon's horizontal parallax and semi-diameter are given for every even hour throughout the year. They must be taken from the almanac for some definite instant of Greenwich mean time. In computations from observations that depend upon the time of the sun's meridian passage, at which instant the local apparent time is 0 hours, and the Greenwich apparent time is equal to the longitude, if west, or to 24 hours minus the longitude, if east, it becomes necessary to correct the equation of time for longitude, before it is applied to the Greenwich

apparent time to obtain a Greenwich mean time for use in taking out other desired data. This Greenwich mean time is sufficiently correct for all practical purposes as the equation of time never changes more than 1.3 seconds in an hour. The Ephemeris, being computed for the Greenwich meridian, contains the right ascension, declinations, equation of time, and other elements for given equidistant intervals of Greenwich time. Hence, before the value of any of these quantities can be found for a given local time it is necessary to determine the corresponding Greenwich time. Should that time be one for which the *Nautical Almanac* gives the value of the required element, nothing more is necessary than to employ that value. But if the time falls between the almanac times, the required quantity must be found by interpolation. The almanac contains the rate of change or difference of each of the principal quantities for some unit of time, and, unless great precision is required, the first differences only need be regarded. In order to use the difference columns to advantage, the Greenwich date should be expressed in the unit of time for which the difference is given. Thus, for using the hourly differences, the Greenwich time should be expressed in hours and decimal parts of an hour; when using the differences for one minute, the time should be in minutes and decimal parts of a minute.

Every celestial body is at a given instant of time in the zenith of some point on the earth's surface; this point is called the geographical position of the body; for the sun, it may be called the subsolar point, for any other heavenly body, the subastral point. The theory being the same for all bodies, the method, as applicable to the sun, will be described. The sun being in the zenith of a given place, one-half of the earth will be illuminated (neglecting refraction), and the other half will be in darkness; the dividing line, called the circle of illumination, will be everywhere 90 degrees from the subsolar point. To an observer anywhere on the circle of illumination, the sun will be in the horizon; at the subsolar point, the sun will be in the zenith, and therefore its altitude will be 90 degrees. If the observer is at any intermediate point between the circle of illumination and the subsolar point, he will have the sun above his horizon and at an altitude between 0 degree and 90 degrees. If a plane be passed through this intermediate position, parallel to the circle of illumination, its intersection with the earth's surface will trace out the circumference of a small circle, at every point of which, at the given instant, the sun will have the same altitude. This circle is called a circle of equal altitudes with respect to the sun, and the sun's zenith distance, at the given instant, is the same at all points of the circle. Since the distance of the observer's zenith from the celestial body, in minutes of arc, is the same as the observer's distance in sea miles from the body's geographical position, and in the case of the sun from the subsolar point, when an observer measures the altitude of the sun, the complement of which is its zenith distance, he actually finds his distance in sea miles from a known spot on the earth, and hence locates himself on a circle of position or circle of equal altitude. The geographical position of a celestial body is located by its lat-

itude and longitude like any terrestrial point; the latitude being the body's declination, the longitude the body's Greenwich hour angle, or number of hours elapsed since the body was on the meridian of Greenwich. In the case of the subsolar point, the latitude equals the sun's declination, and the longitude the Greenwich apparent time. If the subsolar point be located on a terrestrial globe and a circle, whose radius equals the observed zenith distance of the sun, is drawn on the globe, with the subsolar point as a centre, the observer will be somewhere on the circumference of this circle; since the subsolar point bears in a given direction from him, his position is approximately in the opposite direction from the subsolar point, so that the sun's azimuth at the time of the observation indicates the part of the circle on which the observer is situated; and his position would be fixed, if, having the above data, he should find a second circle of equal altitudes, projected from observations of a second celestial body, or from observations again of the sun after a lapse of sufficient interval of time, the observer's position remaining unchanged. However, this graphic method cannot be used for the reason that it is impracticable to carry a globe of such dimensions as to admit of accurate results.

The circles of equal altitude will appear on the Mercator chart as shown in the accompanying figure, being drawn out toward the north and south points on account of the expansion of the scale of latitude of the Mercator projection. These curves are called "Curves of equal altitudes." The right-hand side of the figure in which S_1 is the geographical position of the body observed shows the curves at intervals of 10 degrees. It will be noticed that all these curves cross the parallels of latitude and meridians of longitude at different angles. Near the north and south points the curves run about east and west with the parallels of latitude, and a large error in longitude makes but a slight error in latitude; near the east and west points the curves run with the meridians and a large error in latitude makes but a slight error in the resulting longitude.

Suppose that on an afternoon in April an observer at sea on the north Atlantic Ocean observes the true altitude of the sun's centre to be 50 degrees, the Greenwich mean time of observation being 1 hour, 15 minutes, 30 seconds. From the *Nautical Almanac* the sun's corrected declination is 10° N., the equation of time 0 minutes, 06 seconds, additive to mean time. The Greenwich apparent time is therefore 1 hour, 15 minutes, 36 seconds. Hence the latitude of the subsolar point S_1 is 10° N. and its longitude 1 hour, 15 minutes, 36 seconds west, or $18^\circ 54'$ W. From this point S_1 as a centre the curve of equal altitudes with radius of 40 degrees will be the right-hand curve NXS on the Mercator chart. This curve tells us the fact that the observer is somewhere on its circumference. However, if the bearing of the sun at the instant of sight is given, the quadrant containing the position is indicated. If, in the example, the sun bears southward and eastward, the ship is in the northwest quadrant. Again, suppose that after the lapse of 3 hours, 24 minutes, 24 seconds a second observation shows the sun's altitude to

be 40 degrees. During this interval the sun in its diurnal path will have passed to the westward at the rate of 15° of longitude per hour, carrying with it its system of curves of equal altitudes. The Greenwich apparent time becomes 4 hours, 40 minutes, or the longitude of the subsolar point S_2 is 70° . The declination is N. $10^\circ 03' 01''$, or the latitude of S_2 is N. $10^\circ 03' 01''$, the zenith distance is 50° , the curve on the Mercator chart is N'XS', and the ship is somewhere on this curve. We now know that at the first observation the ship was on the right-hand curve NXS and at the second observation she was on the left-hand curve N'XS', therefore if the ship did not change her

FIG. 1.

position in the interval between the observations, she was at one or the other of the two points (X or Y) in which the curves intersect, and the one which was the observer's position depends on the sun's bearings at the times of observation. If the observer, whose position is somewhere on the right-hand curve, can be supposed to make an instantaneous change of position through a distance of n sea miles directly toward or directly away from the geographical position S_1 , on a great circle passing through S_1 , the sun's altitude will be increased or diminished by n minutes of arc; if the course is kept at right angles to the bearing of the sun, he will keep on his original curve of altitude; if the course is at intermediate angles, the altitude will be changed proportionately to the product of the distance run in sea miles multiplied by the cosine of the difference between the azimuth of the celestial body and the course of the ship; and the observer will be on another circle of equal altitudes, belonging, however, to the same system of circles, that is, the system having S_1 as a centre.

In going then from a point on one circle of equal altitudes, which was the ship's position at the first altitude, on a certain course and distance made good, the observer arrives at a point on another circle of equal altitudes, of the same system, however. The altitude at this latter circle corresponds to what would

have been observed there at the instant of the first observation. The circle of position can then be found after a run to the place of a second observation, either by reducing the first altitude to what it would have been at the place of the second observation at the time of the first observation; or by taking a point in the first curve, representing the ship's approximate position, laying off the course and distance made good in the interval from it to a second point, and then drawing, through this second point, a curve parallel to the corresponding part of the first curve of altitude. The intersection of this transferred curve with the curve of altitude of the second observation will give the ship's position at the time of the second observation. This general method is known in modern navigation as "Sumner's double altitude method."

Ordinarily it is inconvenient to plot the representations of the circles of equal altitude on a Mercator chart on account of their oval form; but upon other projections, like the stereographic, in which angles remain true and in which the scale is uniform within the limits of tolerance, the circles of equal altitudes appear as circles upon the chart and may easily be described when the zenith distance of the observed body is not large. And this convenient and satisfactory method of finding the position of the ship may also be employed with the Mercator projection in low latitudes within the extent through which the scale remains practically uniform. In certain cases, as may happen in the tropics, the sun may be observed when close to the zenith, say within a degree or so; the subsolar point located by its latitude and longitude (the latitude being the sun's declination and longitude the Greenwich apparent time of observation); and that portion of the circle near the ship's dead reckoning position drawn with the true zenith distance as a radius. After the sun's azimuth has altered from 25 degrees to 30 degrees, and under such circumstances it will do so in a very short time, draw a second arc as the result of a second observation. Transfer the first arc for the run between sights and the intersection of the transferred arc with the arc corresponding to the second observation will give the ship's position with satisfactory accuracy. In using the method of double altitudes, there should be a change of bearing of the sun between observations of at least two points; of course, the nearer the change is to 90 degrees the more nearly the resulting lines of position run at right angles to each other and the more clearly will their intersection be indicated. The principles of the Sumner double altitude method, as explained in the case of the sun, apply as well to any other celestial body; but, as a general thing, when one star may be observed others are available, so that two may be observed at one time and the ship may be located at one of the two intersecting points of the resulting circles of position. Suppose two stars are observed at the same moment at a given place; that one, whose subastral point is S_1 (see Fig.), has an altitude of 50 degrees and bears southward and eastward, and that the other, whose subastral point is S_2 , has an altitude of 40 degrees and bears southward and westward. The result of the first observation locates the ship on the northwest arc of the circle of position

NXS, the result of the second on the northeast arc of the circle N'XS', and, therefore, at their northern intersection X. Such observations are known as simultaneous observations; for these observations bodies should be so selected that the resulting circles or lines of position will intersect at an angle not less than 30 degrees.

Simultaneous observations are preferred to double altitude observations, since from the former the position of the ship may be obtained at once without an interval of waiting and without the errors which arise from the uncertainties of the course and distance obtained when there is a change of position; besides, a third line may be obtained and the fix from two lines either verified or disproved, the fix being verified when the three lines have practically the same point of intersection. In the figure, the circumference of a circle of position is represented as having been laid down from S_2 , the geographical position of the observed body, as a centre with a radius S_2X equal to the zenith distance of the observed celestial body; but it is evident that a small arc of the circumference, not differing sensibly from a straight line within the limits of uncertainty in the ship's reckoning, may be determined in the following manner from a neighboring geographical position, as at P, inside or outside of the circumference and at or near the position of the ship as given by dead reckoning: (1) Find the great-circle distance (zenith distance) and bearing (azimuth) of the geographical position of the observed body S_2 from the observer's assumed position P; (2) take the difference, in minutes of arc (nautical miles), between this zenith distance S_2P due to the observer's assumed position, and the zenith distance S_2X found from the true altitude resulting from observation; (3) lay off this difference, which is called the altitude-difference, or intercept, from the assumed position P either away from or toward the observed celestial body according as the true altitude by observation is less or greater than the altitude at the assumed position, and through the point thus reached draw a line at right angles to the bearing. The line so drawn will evidently be a tangent to the circumference of the circle of position, and will be so nearly coincident with this circumference throughout such length as the Sumner line need have, in all those cases in which the zenith distance is as great as 10 degrees, that the tangent itself may be taken as the true line of position. Obviously the only trigonometrical computation that occurs under this method is in calculating the length and bearing of the great-circle arc joining the position P, which is assumed or known from the dead reckoning, with the geographical position, S_2 , which is always in a latitude equal to the declination of the observed celestial body at the instant of observation and in a longitude equal to the hour angle of the body from the prime meridian (Greenwich). In the case of the sun the Greenwich hour angle is expressed by Greenwich apparent time, and in the case of any other celestial body the Greenwich hour angle is found by adding together the Greenwich mean time and the right ascension of the mean sun, as ascertained from the *Nautical Almanac* for the instant of observation; and from this sum subtracting the right ascension of the observed celestial body.

Being strictly in the nature of calculating the great-circle distance and course between two points whose latitudes and longitudes are given, these computations may be made according to the rules of trigonometry; but in practice it is unnecessary to do so, since various altitude and azimuth tables give the distance and azimuth or true bearing, on the globe or on the celestial sphere, of any place from every other place, and consequently the altitude and azimuth or zenith distance and bearing that any celestial body would have at any given time to an observer situated in any given geographical position. So that an observer in a geographical position as yet unknown, about to measure the altitude of a celestial body for the purpose of deducing geographical position, may assume beforehand a geographical position in the region of his station and find from the tables the altitude and azimuth which the celestial body would have if observed from the assumed position; and then, comparing the altitude so taken from the tables with the true altitude obtained by measurement, may at once find the Sumner line by laying off from the assumed geographical position along the direction of the bearing an intercept, called the altitude-difference, and drawing through its extremity a line at right angles to the bearing. After finding the altitude-difference or intercept, the simplest procedure consists in laying it off on the chart from the assumed position and drawing the Sumner line through its extremity, but if, for any reason, this process is not desirable, the latitude and longitude of the extremity of the intercept, which is a point on the Sumner line, called the "computed point," may be found by the use of the Traverse Tables. The exact position of the observer on the Sumner line is, of course, indeterminate from one observation, unless either the latitude or longitude of the observer's position be known beforehand, but the computed point will always be nearer to the actual position of the observer than the dead reckoning or assumed position is. To obtain a fix, that is, to find the actual position, it is necessary to determine the intersection of the first Sumner line with another line of position, which may be another Sumner line or a line of bearing or any other line containing the ship's position at the same time.

Reverting to the example in which the position by dead reckoning was found to be in lat. $38^{\circ} 57' 47''$ N. and long. $73^{\circ} 23' 51''$ W., let it be supposed that an observation of the altitude of the lower limb of the sun, bearing eastward, was measured by sextant to be $32^{\circ} 52' 50''$, by an observer elevated 30 feet above the level of the sea, when the chronometer showed the Greenwich mean time to be 1 hour, 30 minutes, no seconds after noon on 4 April. The true altitude of a celestial body at any place on the earth's surface is the altitude of its centre, as it would be measured by observer at the centre of the earth, above the plane passed through the centre of the earth at right angles to the direction of the zenith. The observed altitude, as measured at sea, may be converted to the true altitude by the application of the following-named corrections: Index correction, dip, refraction, parallax and semi-diameter. The corrections for parallax and semi-diameter are of inappreciable magnitude in observations of the

fixed stars, and with planets are so small that they need only be regarded in refined calculations. Excepting the index correction, which appertains to the particular instrument with which the measurement has been made, the corrections named are found tabulated in nautical works for the convenience of navigators. Since the dead reckoning is uncertain, let it be assumed that the ship has arrived in lat. 39° N. and long. $73^{\circ} 30'$ or 4 hours, 54 minutes W., then the hour-angle of the sun eastward of this meridian would be the difference between the longitude and the Greenwich mean time, or 3 hours, 24 minutes.

Entering the table of simultaneous altitudes and azimuths of celestial bodies under lat. 39° and declination $5^{\circ} 30' \text{ N.}$, being the sun's declination as ascertained from the *Nautical Almanac* for Greenwich mean time, 1918, 4 April, 1 hour, 30 minutes, the altitude and azimuth that the sun's centre would present at the hour angle 3 hours, 24 minutes east of the meridian to an observer in lat. 39° N. and long. $73^{\circ} 30'$ are found to be $33^{\circ} - 10.2'$ in altitude and $\text{N. } 112.4^{\circ} \text{ E.}$ in azimuth. But the altitude of the sun's lower limb as measured by the sextant, being corrected by adding $9' 16''$, the amount of the combined corrections taken from the tables, shows the true altitude of the sun's centre at the instant of observation, in the actual position of the ship, to be $30^{\circ} 2.1'$. Consequently the ship is located on a line running $112.4^{\circ} \pm 90^{\circ}$ or N. 22.4° E. and S. 22.4° W. through a point distant from the assumed position ($39^{\circ} \text{ N. } 73^{\circ} 30' \text{ W.}$) by the amount of the altitude-difference ($33^{\circ} 10.2' - 30^{\circ} 02.1'$), 8.1 nautical miles, laid off in the direction of the azimuth, N. 112.4° E.

Or, the Sumner line may be defined by its direction, N. 22.4° E. and S. 22.4° W. , and the geographical position of the "computed point" found by applying to the assumed position the difference of latitude and difference of longitude due to the length and direction of the intercept or altitude-difference, treated as a distance and course by the traverse table, thus:

Course, $112^{\circ}.4$	Distance, 8.1	Difference latitude S. 3.08	Departure E. 7.49	Difference longitude E. 9.64
Lat. of assumed position.....		39°	$00'$	$00'' \text{ N.}$
Difference in lat.			$3'$	$05'' \text{ S.}$
Lat. of computed point.....		38°	$56'$	$55'' \text{ N.}$
Long. of assumed position.....		73°	$30'$	$00'' \text{ W.}$
Difference in long.			$9'$	$38'' \text{ E.}$
Long. of computed point.....		73°	$20''$	$22'' \text{ W.}$

To conclude the illustration of the proceedings leading to the definite determination of the geographical position of the ship from observations of celestial bodies another observation must be chosen, giving a second Sumner line whose intersection with the first line, after the first line has been transferred parallel to its original direction by an amount in direction and distance represented by the true course and distance of the ship's advance during the interval between the observations, will denote the

required position. Let a meridian altitude of the sun be chosen for this purpose, showing the true altitude of the sun's centre, bearing south, to be $56^{\circ} 10' 00''$ at the instant of its culmination in transit over the meridian of the observer on 4 April after the ship had proceeded 40 nautical miles on the true course $N. 60^{\circ} E.$ from the position at 8 A.M. The Sumner line given by the noon observation of the sun will coincide for a short length with a parallel of latitude, since its direction must be at right angles to the bearing of the sun, which, being to the southward of the observer on his meridian, would have an azimuth of 180 degrees from the north point at the time of observation. The declination of the sun at the instant of observation, as ascertained from the *Nautical Almanac*, at Greenwich mean time, 1918, 4 April, 4 hours, 50 minutes, is $5^{\circ} 34'$ north of the equator, and since the sun is $33^{\circ} 50'$ south of the zenith of the observer, as shown by the remainder found by subtracting the sun's true altitude from 90 degrees, the declination of the zenith of the observer must have been $5^{\circ} 34' + 33^{\circ} 50'$ or $39^{\circ} 24'$ north of the equator. The declination of the zenith being equal to the latitude of the place, the parallel of latitude on which the ship was located at the time of the noon observation must have been $39^{\circ} 24' N.$

Transferring the computed point of the Sumner line determined from the morning observation by the amount of the ship's run to noon:

Course, 60°	Distance, 40	Difference latitude N. 20	Departure E. 34.6	Difference longitude E. 44.6
Lat. of computed point.....		$38^{\circ} 56'$	$55'' N.$	
Transfer in lat.....		$20'$	$00'' N.$	
Transferred computed point.....		$39^{\circ} 16'$	$55'' N.$	
Long. of computed point.....		$73^{\circ} 20'$	$22'' W.$	
Transfer in long.....		$44'$	$36'' E.$	
Transferred computed point.....		$72^{\circ} 35'$	$46'' W.$	

The first Sumner line transferred to the time of the second observation is therefore a line passing through a position in lat. $39^{\circ} 16' 55'' N.$ and long. $72^{\circ} 35' 46'' W.$ in a direction $N. 22.4^{\circ} E.$ and $S. 22.4^{\circ} W.$ The change of longitude for each minute of change in latitude in passing along a Sumner line, called the longitude factor of the line, is tabulated in works on navigation; and it is by consulting such a table that the longitude factor of this line is ascertained to be 0.53. The difference of latitude between the latitude at noon and the latitude of the transferred computed point ($39^{\circ} 24' 00'' - 39^{\circ} 16' 55''$) is $7' 55''$ or $7.9'$, and this, being multiplied by 0.53, gives the product $4.2'$, which is the difference of longitude to be subtracted from the longitude of the transferred computed point in order to find the longitude of the noon position of the ship. Hence, the longitude at noon is $72^{\circ} 35' 46'' - 4' 12''$ or $72^{\circ} 31' 34''$; and the noon position from the astronomical observations is:

$39^{\circ} 24' 00'' N.$ and $72^{\circ} 31' 34'' W.$

From this position the course to the destination should be determined anew. The routine of a day's work at sea consists in working the dead reckoning, an A.M. Sumner line and azimuth taken when the sun is in its most favorable position for the purpose, a meridian altitude of the sun (or, when clouds interfere at noon, a sight for latitude as near the meridian as possible), and a P.M. Sumner line and azimuth. This represents the minimum of work, and it may be amplified as circumstances render expedient; but no part of it should ever be omitted unless cloudy weather renders its performance impossible. The current may be found by comparing the noon positions as obtained by observations and by dead reckoning; and the day's run is calculated from the difference between the day's noon position by observation and that of the preceding day. To "current" is usually attributed all discrepancies between the dead reckoning and observations; but it is evident that this is not entirely due to motion of the waters, as it includes errors due to faulty steering, improper allowance for the compass error, and inaccurate estimate of the vessel's speed through the water.

The compass error is obtained in connection with the morning and afternoon observations by ascertaining the sun's true bearing from the azimuth tables and comparing it with the bearing observed by compass. The variation indicated by the chart is taken away from the total error and the remainder is the deviation of the compass for the ship's heading at the time of the observation.

By performing the work that has just been described a good position is obtained at noon each day, which, in a slow-moving ship with plenty of sea room, may be considered sufficient; but conditions are such at times as to render it almost imperatively necessary that a more frequent determination of the latitude and longitude be made. If the ship is near the land or in the vicinity of off-lying dangers, if she is running a great circle course requiring frequent changes, if she has just come through a period of foggy or cloudy weather or if the indications are that she is about to enter upon such a period, or if she is running at high speed, it is obviously inexpedient to await the coming of the next noon for a fix. The responsibilities resting upon the navigator require that he shall earlier find his ship's position; and generally speaking, the greater the speed made by the ship the more absolute is this requirement. The key to all such determinations will lie in the Sumner line. The mariner must keep in mind two facts: First, that a single observation of a celestial body can never, by itself, give the *point* occupied by an observer on the earth's surface; and, second, that whenever any celestial body is visible, together with enough of the horizon to permit the measuring of its altitude, an observer may thereby determine a line which passes through his own position on the earth's surface in a direction at right angles to the bearing of the body. See ASTRONOMY; COMPASSES; HYDRAULIC ENGINEERING; LATITUDE; LONGITUDE; LOG; METEOROLOGY; SEXTANT; SOUNDING.

NAVIGATION, Freedom of. See SEAS, FREEDOM OF THE.

NAVIGATION ACT, an important act passed by the British Parliament in 1651 for the protection of British shipping and commerce. In relation to early American conditions the act provided that all colonial trade should be carried on in ships built and owned in England in the colonies (a provision which stimulated colonial shipbuilding), and that, in the case of many specified goods, trade should be with England only. The act was largely rendered inoperative by colonial smuggling. The efforts at last made to enforce the rule were among the chief causes of the Revolution.

NAVIGATION LAWS, as adopted by the United States in 1792-93, have been in operation since that date with few changes or revisions. The laws contain the following provisions: No vessel, unless entirely built in this country and wholly owned and officered by Americans, is considered an American vessel having the right to be protected by the American flag. No foreign vessel is permitted to engage in the American coasting trade, the same extending from Atlantic to Pacific ports. American vessels are no longer considered as such if even a partowner (with a few exceptions) resides abroad for a short time. Transfer of an American vessel to foreigners prohibits it from ever again sailing under the American flag. If an American vessel makes any repairs in a foreign port, duty must be paid on the value of all such repairs on her return to this country. The repairing of foreign vessels in our ports, with foreign materials, is placed under restriction. A tax of six cents per ton of their burden, called a tonnage tax, is imposed on all vessels (except fishing and pleasure vessels) engaged in trade to ports not in North or Central America and a few other specified places, the maximum aggregate tax in any one year not exceeding 30 cents. Foreign vessels pay the same tax, but if one of the officers of an American vessel is a foreigner, it is forced to pay an additional tax of 50 cents. Materials for the construction of vessels for foreign trade may be imported free of duty, but the duty must be paid if the vessel engages for more than two months a year in the coasting trade. American vessels may unload at any port of delivery in the customs district, but foreign vessels can only discharge their cargoes at a port of entry, which is a certain designated port in each customs district in the United States. Exceptions are made when they are laden with coal, salt or similar merchandise in bulk. See ADMIRALTY AND MARI-

TIME JURISDICTION; MARITIME LAW; MERCHANT MARINE IN THE UNITED STATES.

NAVILLE, nă-vêl, Edouard Henri, Swiss Egyptologist: b. Geneva, 14 June 1844. He was educated at the University of Geneva, at King's College, London, at Bonn and at Paris; went to Egypt in 1869, and there made important discoveries; was appointed editor of the 'Book of the Dead' by the London Congress of Orientalists in 1875, and in 1886 published 'Das Aegyptische Todtenbuch der 18. bis 20. Dynastie'; and in 1891 became professor of Egyptology at Geneva. He wrote volumes on the store city of Pithom (1885), on Goshen (1887), on Osorkou II's festival hall (1892), 'Deir el Bahari'; 'Les amis de la paix dans l'Afrique du Sud' (1901); 'La Religion des anciens Egyptiens' (1906; Eng. trans., 'The Old Egyptian Faith,' 1909); 'Papyrus funéraires de la XXIIe dynastie' (1912).

NAVY, History of the. From a period earlier than authentic history, the Greeks began to exhibit a spirit of naval enterprise, and as long as their independence remained the various states into which both the mainland and the islands of Greece, as well as their Asiatic colonies were divided, rivaled each other in planting colonies and pushing their commerce in all directions. These states had also their armaments, and fought fiercely with one another, as well as with their foreign foes. The Athenians, Corinthians, Rhodians, even single cities like Chalcis and Megara, became renowned for their naval strength, and naval battles play a conspicuous part in the history of Greece. In the Persian invasions of Greece the size and power of the Persian fleets also forms a notable circumstance, and the great battle of Salamis (480 B.C.), in which Themistocles defeated the fleet of Xerxes, was the turning-point of the last Persian invasion. The smallness of the Greek galleys, and the superior size and number of those of the enemy, render this battle remarkable. The details of the tactics employed in it, and even the position of the rival fleets, are still matters of critical disputation.

But centuries before the rise of any naval power in Greece, Phœnicia (q.v.) had, certainly as early as 1100 B.C., a powerful fleet to protect its commerce and colonies through the Mediterranean from the attacks of pirates.

Among the Phœnician colonies arose one which in enterprise, ambition and power eclipsed the parent state. Carthage, the rival of Rome, rose to her high rank among the nations of antiquity purely in virtue of her naval commerce. In her long struggle with Rome it was mainly the wealth acquired by commerce which enabled her to maintain the conflict. The Carthaginians also stimulated the Romans to enter upon naval enterprise. A Carthaginian vessel which had been cast on the coast of Italy furnished the model for their first fleet, which consisted of 100 quinqueremes and 20 triremes. This fleet is said to have been built in 60 days. Duilius, who commanded it, wisely distrusting the seamanship of his improvised sailors, contrived a means of approximating his first contest with the Carthaginians as nearly as possible to a land fight. By the use of grappling irons peculiarly contrived the Roman vessels

were firmly attached to those of the enemy, and a struggle ensued, in which superior force and determination alone could influence the result. Thus the first great naval battle of Rome, fought off the Lipari Islands, 260 B.C., by the fleet of Duilius against a Carthaginian fleet of superior size under a leader named Hannibal, resulted in a complete victory, which was celebrated by a triumph at Rome.

The Ancient Galley, the war-ship of the Greeks, was a narrow vessel about 100 feet in length. It was admirably fitted to move rapidly in smooth water, and the numerous rowers gave great impetus to the attack of the beak, which was its principal means of aggression. The bow curved inward, forming a circular beak, which was faced with iron; or else it receded suddenly, having a single sharp point like a ploughshare, projecting at the surface of the water, and intended to open the side of an antagonist. Frequently the beak was formed to represent a lion, tiger or other ravenous beast calculated to inspire terror. It was always surmounted by the national emblem; thus an owl stood on the prow of an Athenian galley; a cock on a Phœnician or Carthaginian; and the eagle on a Roman. Here or at the stern were also placed the ensigns and standards, and trumpeters standing beside them sounding their shrill blasts to inspire courage at the moment of onset. From the bow to the stern there extended a flooring or deck, which served as a battle-field for the mailed and heavy-armed soldiers. The stern was covered with a circular shed or pavilion, richly carved and decorated with streamers and trophies. Under this was placed the *tutela*, representing some patron deity, to which sacrifices and prayers were offered, and which was held so sacred as to furnish a sanctuary to whoever took refuge there. From this elevated station, too, the commander surveyed the fight and directed the efforts of his followers. There were two distinct classes of officers and men in each galley. The commander of the soldiers was supreme, and under him the pilot, who took his station abaft, at the side of the steersman, directed all necessary evolutions and manœuvres. The pilot was assisted in the command of the sailors by his mate, and by the boatswain or encourager of the rowers; while a musician marked the measure of the stroke, and by the harmony of his voice and instrument inspirited the rowers when weary with toil. The rowers were frequently, as in more modern times, malefactors chained to the oar. Javelins and arrows were discharged in showers from the deck, or from turrets at the bow and stern. As a protection from these a curtain of hides was used, from behind which the soldiers discharged their missiles in return, and thrust with long spears used only at sea. In the centre were engines from which rocks were projected of size sufficient to sink a ship; and masses of iron called dolphins were projected from the mast-heads to break the bottom of the enemy's vessel. But the chief means of offense was the attack of the beak, and to make it with advantage it was generally desired to gain the wind. Combustibles were also cast from ship to ship, and peculiar devices due to the ingenuity of the particular commanders adopted on special occasions. The line of battle was usually triangular, the admiral's ship being at the angle in advance, and the line of

storeships forming the base. Before encountering it was usual for the admiral to pass in a small boat throughout his fleet, haranguing his followers, and urging them to do their duty. Thus inspirited a shout of anticipated triumph would pass from ship to ship, and when the gilded shield was at length displayed as a signal for battle, the shrill trumpets sent forth their blasts, and the combatants rushed to the encounter, rending the air with shouts and war songs. The battle won, the victors returned to port, towing their prizes, their ships being decorated with fragments of the wrecks, themselves crowned with laurel, and singing pœans to Apollo. The richest of the spoils was reserved as an oblation to the gods, and broken or sometimes entire galleys were placed in the precincts of the temples. Little change was made by the Romans in their mode of warfare down to the time of the fall of the empire. The emperors of Constantinople had still a fleet of galleys propelled by rowers.

Navies of the Middle Ages.—On the fall of the Roman Empire naval enterprise declined, but only for a brief period. The honor of reviving it is disputed by the French and the Italians. To the latter chiefly belongs the honor of leading the way in the development of modern European commerce, but for the growth of naval armaments we must look also to the north of Europe. Charlemagne had a considerable fleet both on the Mediterranean and the ocean; but already in his time, and even in that of his predecessors, the settled states of Europe had begun to become subject to the piratical excursions of Northmen and Danes, which were afterward directed so persistently against England, and continued for several centuries to disturb its government. In the meantime the Italian republics of Venice and Genoa began to restore the commerce of the Mediterranean, and to open up communications with India by the Red Sea and the Persian Gulf. The Pisans and Florentines followed, and in the time of the Crusades the chief naval armaments of the Christians were supplied by the Italian cities. The successors of Charlemagne did not follow his example in maintaining a regular fleet, yet Saint Louis was able to transport his own army to Africa and to defend his coast against the English, but Philip le Bel had recourse to the Genoese against the English. The great naval battles of these times were fought among the Italian republics, or by them against the Turks, with whom they alternately traded and made war. After the epoch of the Crusades we have a period which in one aspect of its development might be called the epoch of commerce and especially of mercantile navigation. The honor of leading the way in this new epoch belongs to the Portuguese. They were followed by the Spanish, the English, the Dutch, the French and ultimately by all the other nations of Europe, according to their means and opportunities. The Spanish navy reached its highest power in the time of Charles V and Philip II. Francis I attempted the revival of the French marine and it was vigorously undertaken by Richelieu. The administration of Colbert revived both the mercantile and national navy, and the latter attained its chief strength and highest glory in the reign of Louis XIV, when it opposed, and sometimes not unsuccessfully, the united navies

of England and Holland. The navy of Holland became powerful almost from the time of the national independence, and contended with success alternately against the fleets of England and France. Some of the most hotly contested naval battles on record have been fought between the English and Dutch fleets.

Cannon are said to have been first used in naval warfare by the Venetians against the Genoese in 1370, a considerable time after their invention.

The Battle of Lepanto.—The famous battle of Lepanto, which was fought between the Christian powers and the Turks 7 Oct. 1571, may be considered as representative of the first stage of the transition from the earlier mode of warfare. The Christian fleet was collected in the port of Messina in September 1571. It was contributed by the powers who had joined in the Holy League. The Spanish fleet consisted of 77 Spanish, 6 Maltese and 3 Savoyard galleys under Don John of Austria, who commanded the joint fleet; there were 12 papal galleys, under Marc Antonio Colonna; and 108 Venetian galleys and 6 galeazzi under Sebastian Veniero. The Turkish fleet, consisting of 300 vessels, under Capudan-pasha, Musinsade Ali, lay in the Gulf of Lepanto. Though the Turks were more numerous, the Christians were better armed and equipped. Their soldiers wore coats of mail and helmets, and were provided with firearms. The Turks defended themselves with leathern shields and had bows and arrows in place of guns. The prows of the Christian galleys were less open and better defended than those of the Turks. The admirals, according to ancient custom, led the van. Both parties moved to the assault, but the wind changing at the moment favored the Christians. The admiral's galleys closed after a brief cannonade, and grappled each other. The Spaniards boarded three times and were thrice driven back. A reinforcement of 200 men enabled them to return again to the assault with decisive effect and an indiscriminate slaughter of the Turks took place. The head of Ali was exhibited on a pole to his followers. The battle after this only waxed fiercer, and the Turks fought with the courage of despair. So intense did the struggle become that the galley slaves in both fleets joined in the contest; but while the galley slaves of the Christians, who consisted of criminals, fought on their own side in hope of earning a pardon, those of the Turks, who were Christian slaves, rose against their masters. Over 15,000 Christians are said to have been relieved from servitude by the victory. The Turks lost besides 224 ships and 30,000 men.

Modern Navies.—The improvements determined by the use of artillery were chiefly an increase in the size and offensive strength of the ships, and a relative diminution in the number of men. Oars were abandoned for sails. Battles were fought and ships manœuvred by the sailors, and the marines or organized body of soldiers became a mere auxiliary force, available as sharpshooters and for land engagements. Two leading qualities now stood forth as the most important object to be attained in the construction and equipment of vessels for war—strength of offensive armament and speed and facilities of manœuvring. These qualities did

not now first acquire importance, but they gained in relative importance at the expense of a previously preponderating element of equipment, namely, the number of fighting men available for assault at close quarters. Two classes of vessels, according to the preponderance of one or other of these qualities, thus came to constitute the chief strength of modern fleets. The ship of the line, or first-class war-vessel, carried the strength of offensive equipment to the utmost limit practicable without sacrificing seagoing qualities. The frigate, only excelled in strength by a line-of-battle ship, was built and rigged with every artistic appliance to secure speed. Even line-of-battle ships were sometimes made too heavy for effective service, and facility of movement could not be altogether neglected with impunity; but the great point in a first-class vessel was the weight of broadside and a hundred or more guns on three decks were commonly carried. In a pitched battle it was the line-of-battle ships that bore the brunt of the fight and decided the day. The frigates scoured the seas on special missions, escaped from the enemy's line-of-battle ships by speed, destroyed his privateers and protected the commerce of their own state. During all the great European wars these were the leading types of vessels employed. The tactics of naval warfare during this period, allowance being made for the different means of offensive, did not differ materially from the ancient methods. To gain the wind of an adversary, to break his line and to engage him at close quarters with superior force, were still the main objects to be pursued. But a change took place when steam was introduced as a means of propulsion and iron as a material for the construction of vessels. Vessels clad in iron and steel armor superseded the oak-built ship of the former epoch. Improvements in the size, range and destructive power of projectiles effected a new revolution, or succession of revolutions, in the science of naval armaments, and the broadside gave way to a small number of powerful guns. The struggle between these new developments of offensive and defensive force still goes on, and the introduction of gunboats, torpedo boats, submarines, torpedo destroyers, scout and battle hydroplanes and other craft have made naval warfare a new and peculiar science, totally different from the naval warfare of the past.

NAVY BOUNTY. See BOUNTIES.

NAVY DEPARTMENT, an executive department of the government of the United States, created by Congress 30 April 1798, charged with the administration of the navy, with a cabinet officer at its head who is styled Secretary of the Navy. He is nominated by the President from civil life, with the advice and consent of the Senate. Previous to the passage of the Act of 1798 naval affairs were administered by the War Department. The assistant secretary is also appointed by the President from civil life. Naval officers without executive authority assist the Secretary and keep him informed as to details of the department. Certain specific duties devolve upon the Secretary by law and in regard to these he is not subject to the direction of the President, as is the case generally, since the Constitution makes the President the commander-in-chief of the navy. An annual report is made to the President by the Secretary. The assistant secretary is charged with the supervision of docks, navy yards and the marine corps. Since 1880 the department has had a judge-advocate-general, whose duty is to receive, revise and record courts-martial proceedings, examination board findings, inquiries, etc. There is also a general board, composed of the admiral and 13 other officers, by whom plans are formulated for naval construction and operation. In 1862 eight bureaus were established within the department, with a chief at the head of each appointed by the President from among the naval officers. These are the bureaus of Naval Operations; Yards and Docks; Navigation; Ordnance; Construction and Repair; Steam Engineering; Supplies and Accounts; Medicine and Surgery. The first named is charged with the formulation and preparation of plans of operations of the fleet; the Bureau of Yards and Docks, the chiefs of which must be civil engineers, has charge of all public works at naval yards or elsewhere, and furnishes estimates for construction and supplies; the Bureau of Navigation issues orders to individual commanders in the navy, whom it holds responsible for their fulfilment. It also has charge of education at the Annapolis Academy, at the various naval stations and on board naval vessels, the War College, etc., and keeps records of service and issues the *Annual Register*. The Bureau of Ordnance has charge of torpedo stations, proving grounds and naval magazines. It supplies explosives and ammunition and supervises the manufacture of armor-plate for all naval vessels. All ships of the navy are designed, built or repaired by the Bureau of Construction and Repair in co-operation with the Bureau of Ordnance. The Bureau of Steam Engineering designs and has constructed all propulsion engines and auxiliary mechanism for naval vessels, all signal apparatus, v.g., wireless equipment, etc., coaling stations and oil tank reserve supplies. The Bureau of Supplies and Accounts has charge of the purchase of supplies, their storage and care, preparation of contracts, interpretation of new laws relating to naval affairs, etc. Hospitals, hospital ships, laboratories, technical schools for medical and nurse corps, are under the Bureau of Medicine and Surgery. An office of Naval Intelligence is also maintained by the department with six officers and an officer of marines

whose duty it is to prepare and publish information regarding naval affairs abroad and at home. A naval observatory is maintained at Washington, D. C., whence issues regularly the *Nautical Almanac*. The marine corps is in charge of an officer who is responsible directly to the Secretary of the Navy. See CABINET; NAVAL EDUCATION; NAVAL MILITIA; NAVY, HISTORY OF THE; UNITED STATES—NAVY, and consult 'Annual Reports of the Secretary of the Navy' (Washington, D. C.); 'Encyclopedia of American Government' (Vol. II, New York 1912); Fairlie, 'National Administration of the United States' (1905); Learned, H. B., 'The President's Cabinet' (1911); Paullin, C. O., 'Naval Administration in the United States' (in Naval Institute *Proceedings*, Vols. XXII, XXIII, 1906-07).

NAVY LEAGUE OF THE UNITED STATES, The, an organization formed in 1902 for the purpose of upbuilding the American navy and issuing in its interests a monthly bulletin, *The Navy League Journal*. The League has a membership of 10,000; its headquarters are in Washington, D. C.; of similar organizations in Europe the German Navy League built up a considerable membership of nearly a million. The British Navy League, with sections in all the British colonies, has nearly as many members, and is a great power in Great Britain. The French Navy League, with a former President of the republic as its president, has the support of the most influential people of France.

NAVY MANŒUVRES. See ARMY AND NAVY MANŒUVRES.

NAVY REGISTER, a government publication issued annually by the United States Navy Department. It gives a complete list of the officers of the navy and the marine corps in order of their rank, lists of retired officers, resignations, dismissals, deaths, ships in service and other important naval information. Other governments issue somewhat similar registers.

NAVY OF THE UNITED STATES. See UNITED STATES, NAVY OF THE.

NAVY YARD, a water-frontage usually including large storehouses, machine shops, wharves, piers and dry docks used by the government for building and repairing warships, keeping naval stores, etc., under the control of the Navy Department of the government. In Great Britain the term dockyard is generally used, and on the Continent the word arsenal. In England the royal dockyards are at Chatham, Sheerness, Portsmouth, Devonport and Pembroke, besides the Deptford and the Woolwich storeyards. There are also royal dockyards at Haulbowline in Cork Harbor, at the Cape of Good Hope, Gibraltar, Malta, Halifax, Bermuda, Antigua, Jamaica, Sierra Leone, Trincomalee, Singapore, Hongkong, Esquimalt (Vancouver's Island), Fernando Po, Sydney and Shanghai. The greatest naval centres of France are Cherbourg, Brest, Lorient, Rochefort, Toulon and Bizerta in Tunis. Germany has three ports of war, Kiel, Dantzig and Wilhelmshafen. Trieste and Pola are the Austrian naval harbors. Russia has Cronstadt and Sebastopol at home and Vladivostok in the Amur territory. In the United States the principal

navy yards are located as follows: New York (Brooklyn, N. Y.); Mare Island, Cal.; Norfolk (Portsmouth, Va.); Portsmouth, N. H. (Kittery, Me.); Boston (Charlestown, Mass.); League Island (Philadelphia); Washington, D. C.; Puget Sound and Pensacola, Fla. Besides the navy yards there are several naval stations, the important ones being at Boston, Mass.; Newport, R. I.; Indian Head, Md.; Norfolk, Va.; Key West, Fla.; New Orleans, La.; Bremerton, Wash.; Port Royal, S. C.; Portsmouth, N. H.; Philadelphia, Pa.; Cavite, Philippines; San Juan, Porto Rico; Tutuila, Samoa; Guam, Ladrones; Guantanamo, Cuba, Pearl Harbor, Hawaii; Sitka, Alaska, and Yokohama, Japan. At most of these stations high power radio stations have been erected. In the early history of the United States navy, nearly all the vessels were built and equipped at the navy yards. The six wooden frigates used in the Civil War were thus constructed, but the modern steel warships have been built chiefly by contract, by private builders. The Brooklyn navy yard has been long the most prominent, having four very commodious dry docks, where the largest size of battleships can be accommodated. The important departments are for manufacturing and repairs, including the hull and machinery divisions, public works, storekeepers, yards and docks, inspection, accounting and pay, and medical and surgery. The number of employees before the war averaged about 6,000.

NAWA, nā'wā, or **NABA**, Japan, seaport at the southern end of the island Okinawa one of the Liukiu group. It is enclosed in a coral reef and was opened to trade with China in 1894. A Japanese line of steamers trades between here and Kobe, the principal exports being sugar, cotton, silks, etc. Pop. 47,600.

NAWANAGAR, capital of state of same name in India. See **NOWANAGAR**.

NAXOS, nāk'sōs, or **NAXIA**, nāk-sē'ā, Greece, an island of the Ægean Archipelago, the largest of the Cyclades, lying east of Paros; length, 18 miles; breadth, 12; area, 170 square miles. It is hilly, beautiful and extremely productive, yielding fruit, wine, oil, silk, wheat and barley, while the higher grounds afford pasturage for cattle. Cheese, honey and wax are exported, as well as wine, oil, fruit and grain. There are prehistoric quarries of granite, marble and serpentine; and emery exists in abundance, being exported in large quantities. The chief town or village is Naxos (pop. 2,000), near the northwestern part of the island, on a small bay with a harbor and insecure roadstead. In ancient times Naxos was celebrated for its wine, and played a prominent part in the legends of Dionysus or Bacchus, who is said to have found Ariadne here after she was deserted by Theseus. It was anciently inhabited by Ionians who had emigrated from Athens. In 490 B.C. it was ravaged by the Persians. Having joined the Delian League, it revolted in 469 B.C. In 1207 it became the seat of a Venetian dukedom, and was captured in 1579 by the Turks. As a result of the war with Turkey in 1912-13 Naxos was occupied by Greece, and, by the treaties of London and Athens it was given to her permanently by the Powers. Pop. about 20,000.

NAZARENE, nāz-a-rēn', a designation of Jesus Christ. It appears in two forms in the Greek, *Nazarenos* and *Nazoraïos*, both derived from Nazareth. Though this designation occurs 19 times in the New Testament the authorized version only twice renders it "Nazarene" (Matt. ii, 24; Acts xxiv, 5), elsewhere by the words "of Nazareth." The demoniac uses it in addressing Jesus in the synagogue at Capernaum (Mark i, 24; Luke iv, 34); the people to Bartimæus (Mark x, 47; Luke xviii, 37); the soldiers who apprehended Jesus (John xviii, 5-7); the servants at his trial (Matt. xxvi, 71; Mark xiv, 67); Pilate in the superscription (John xix, 19); the disciples on their way to Emmaus (Luke xxiv, 19); Saint Peter (Acts ii, 22; iii, 6; iv, 10); the false witness against Stephen (Acts iv, 14); the ascended Jesus (Acts xxii, 8), and Saint Paul (Acts xxvi, 9). At first it was applied to Jesus as naturally indicating his birthplace. The Galileans were not highly esteemed; their dialect was not pure, being faulty in pronunciation; the population had blended with the heathen; they were seditious, hence the accusation against Saint Paul as "ring-leader of the Nazarenes." Nazareth was a small, obscure town of Galilee, hence Nazarene became a term of reproach and is still used by Arabs as a general designation for Christians. See **NAZARETH**.

NAZARENES, a primitive sect, called also **NAZARĒANS**, originally regarded as Christians, but classed by Epiphanius ('Hæres,' xxix) as heretic and as judaizing. In those times there were so many Judaizing Christians that it is difficult, if not impossible, to distinguish the Nazarenes from the other sects. Jerome (Ep. lxxxix ad Augustinum) applies to them the term "Minæans," a word which recalls "Min" often used in rabbinical literature to designate heretics, mostly Christians who still followed Jewish customs—the two special sects being either Ebionites or Nazarenes. In the Koran, Christians are called Al-Nasara, from Nazareth. The Mandæans still term themselves "Nasoraya." The last of the Church Fathers to refer to the Nazarenes was Theodoret, who also confuses them with the Ebionites. Consult Hilgenfeld, 'Die Ketzergeschichte des Ur Christentums' (pp. 441-445, Leipzig 1884); Krauss, 'Das Leben Jesu nach Jüdischen Quellen' (pp. 254 et seq., Berlin 1902).

NAZARENES, nickname of a certain school of German painters who, not only in coloring and technique, but in representation of ideas, professed to reproduce the method and style of Italian painters of the 14th and 15th centuries, Giotto, Fiesole, Perugino. The leaders in this movement were Overbeck, Schadow, Veit, Schnorr and Carolsfeld, who founded at Rome "The Congregation of the Brothers of Saint Isidore." Schnorr and Schadow later on left the brotherhood. A similar movement in England was initiated by the Pre-Raphaelites (q.v.). Consult Janson, 'Deutsche Präraphaeliten' (in *Zeitschrift für bildene Kunst*, Leipzig 1901).

NAZARENES. See **EBIONITES**.

NAZARETH, nāz'a-rēth (ancient **NASSRA**, that is, "flower"; modern **EN-NASIRAH**, ʿen nāsē'ra), Palestine, a city noted for being the home of Jesus Christ. It is about 20 miles in direct line from the Mediterranean Sea, 15

miles from the Sea of Galilee and 70 miles north of Bethlehem (q.v.). The distance to Bethlehem by the usual route is 110 miles. The city is built in the form of an amphitheatre, in a valley which is 1,115 feet above the level of the sea and surrounded by hills. On the south is the plain on which the Nazarenes threshed their wheat, and farther away is the plain of Esdraelon. From the summit of the hills which surround the city a fine view of the surrounding country may be obtained.

The Nazareth of the time of Jesus extended farther up toward the summit of the hills (Luke iv). The place was the home of Mary, the mother of Jesus, and of Joseph, the husband of Mary. The city is not mentioned in the Old Testament; but it is referred to several times in the New Testament (Luke i, 26; John i, 46, and other places). The streets are narrow, but well paved; the houses are principally of stone. The house in which Jesus lived was held in esteem in the early ages of Christianity, but when the place came into possession of the Moslems, Christians who approached the village were in great danger. At the time of the Crusades (q.v.) the place was ornamented and kept in good order, but again in 1291 the Moslems gained possession and the village declined. The Franciscan Fathers erected a church and monastery in Nazareth in 1300, but they were expelled in 1362. They returned in 1468, but were obliged to leave in 1542, and returned in 1620. They are now in Nazareth and under their auspices the Church of the Annunciation and several other churches and chapels have been built. The Fathers give hospitality to all travelers who visit the place. The pilgrim house is called "Our Lady of America," as it was erected by the contributions of Roman Catholic Americans. The house in which the Holy Family lived is said to be now in Loretto (q.v.), in Italy. Some of the points of interest are the church of the Annunciation, the fountain of the Virgin, the workshop of Saint Joseph, the church of the schismatic Greeks, church of the United Greeks and the *mensa Christi* (table of Christ). Tradition relates of the last mentioned, that it is the rock upon which Jesus Christ took a repast with his disciples. Saint Francis of Assisi visited Nazareth in 1219; and Saint Louis, king of France, and his wife, visited it on 25 May 1251. The Franciscan Fathers have a school for boys and the Ladies of Nazareth a school for girls. There is one hospital in charge of Brothers of Saint John of God, a school for boys under the Brothers of the Christian Schools and a free dispensary and home for the aged in charge of Sisters. The population is estimated to be about 11,000, of whom 2,400 were Roman Catholics (including three rites), 4,000 schismatic Greeks, 250 Protestants and 4,000 Moslems. Strange as it may seem, there are no Jews in Nazareth. The city was taken by Australian cavalry on 20 Sept. 1918. Consult Baedeker, K., 'Palestine and Syria' (Leipzig 1906); Conder, C. R., 'Tent Work in Palestine' (London 1887); Buhl, Franz, 'Geographie Palästinas' (Freiburg 1896); Sanday, W., 'Sacred Sites of the Gospels' (Oxford 1903); Scrimgeour, F. J., 'Nazareth of To-day' (Edinburgh 1910); Ramsay, Sir W. M., 'Education of Christ' (new ed., New York 1911); De Hamme (translated by Rothier), 'Ancient and Modern Pales-

tine'; De Vogue, 'Les églises de la Terre-Sainte'; Roger, 'La Terre-Sainte'; De Hamme, 'Guide-Indicateur des sanctuaires et lieux historiques de la Terre-Sainte'; Stanley, A. P., 'Sinai and Palestine' (new ed., New York 1903); Smith, G. A., 'Historical Geography of the Holy Land' (ib. 1904); Guérin, V., 'Galilee' (Paris 1880).

NAZARETH, Pa., borough in Northampton County, on the Delaware, Lackawanna and Western and the Lehigh and New England railroads, about five miles north by west of Easton and 100 miles northeast of Harrisburg. It is near large anthracite coal fields and has considerable manufacturing. The chief industrial establishments are cigar factories, cement works, paper and hosiery mills, lumber and planing mills, carriage works, foundry, machine shops, lace factory, guitar factory, creamery and large brick and coal yards. There is considerable trade in manufactures and coal. It is the seat of the Nazareth Hall Military Academy and has Gray Cottage and the historic Whitefield House. There is an Indian monument about 180 years old and the borough exhibits what is believed to be the oldest piece of fire apparatus in the United States—a fire-engine imported from England in 1791. Pop. (1920) 4,288.

NAZARETH, Sisters of Charity of. See ORDERS, RELIGIOUS.

NAZARITE, an Israelite who bound himself or herself to the service of Jehovah by a special vow, the obligations of which are stated in Numbers vi, 1-21. The word is derived from a Hebrew root meaning separation and is sometimes translated in the Greek version of the Septuagint by a word that means sanctified or consecrated. The principal stipulations of the vow bound the Nazarite to abstinence from wine or strong drink and from eating of grapes, and forbade him to cut or shave off the hair of his head, or to touch a dead body. The duration of this vow according to Jewish canons could not be less than 30 days; though some took the vow for life. Samson, Samuel and John Baptist are mentioned in Scripture as perpetual Nazarites, of which there were two classes, those who were permitted to diminish their hair when it became too heavy, if they were willing to bring the three appointed sacrifices (Num. vi, 10-12); and those who were forbidden to diminish their hair, but could touch a dead body, as Samson did the jaw-bone of an ass, without being defiled.

The institution of Naziritism was intended to typify the separation and restraint of a holy life. The growth of the hair indicated the virility of heroic virtue; the flowing locks symbolized childlike simplicity, power, beauty, liberty and the unchecked employment of human faculties in the service of God. Maimonides speaks of the dignity of the Nazarites as being equal to that of the high-priest; according to Eusebius the historian (Hist. Eccles. ii, 23), Nazarites were the only Israelites, excepting the high-priests, who were permitted to enter the Holy of Holies. Parents could dedicate their prospective children to the life of a Nazarite. No community life or separation from the engagements and enjoyments of domestic or social life was entailed by the vow, whose special object appears to have been to

set forth symbolically among the people, in the person of separated devotees, useful and impressive lessons of submission to the law of holiness. The Nazarite law was closely developed in post-Biblical times. A Mishna treatise, *Nazir*, is devoted chiefly to the laws in Num. vi, 1-4. Consult Michaelis, 'Law of Moses'; Bähr, 'Symbolik des Mosaici Cultus'; Driver, 'The Books of Joel and Amos' (in the Cambridge Bible for Schools and Colleges, 1897); Gray, 'The Nazarite' (in *Journal of Theological Studies*, 1900, I, 201 et seq.).

NAZARITES, a sect of Christians in Hungary, numbering about 80,000. They profess to go back to the New Testament for their belief and practice; reject Sunday as a holy day of rest, though for convenience adopt it as the day of public worship, which any man of good standing in the church can hold, as they have no separated and ordained ministry. They observe Baptism and the Lord's Supper as sacraments, but refuse to take an oath or to serve in war. They believe in the Trinity, but reject transubstantiation and infant baptism. When a Nazarite is drawn in the conscription a substitute is provided either by his relations or the parish to which he belongs. The sect found an entrance into Hungary through two journeyman locksmiths, Denkel and Kropacek of Szegedin in 1839; the locksmith Heneszi became its apostle and it rapidly grew from 50,000 members to its present number. The simple social life, charity and peacefulness of this sect puts them on a level with the followers of George Fox in English-speaking countries.

NE TEMERE DECREE, a decree issued 2 Aug. 1907 by the Congregation of the Council of the Roman Catholic Church, and which went into effect at Easter (19 April) 1908. This decree, binding on all Catholics throughout the world, pronounces marriages of Catholics null unless celebrated before a duly qualified priest, or the bishop of the diocese, and at least *two* witnesses. The law binds also in the case of marriages in which either of the parties is or has been a Catholic. Its aim primarily is to prevent more efficiently hasty and clandestine unions and to render it easier for ecclesiastical courts to decide as to the existence or non-existence of a promise to marry. In Germany parties to mixed marriages do not come under the decree.

NEÆRA, ne-é'rá, in Greek mythology, a name given to various nymphs; also a maiden mentioned by Horace, Virgil and Tibullus, as well as in Milton's 'Lycidas.'

NEAGH, nā (local, nā'äh), **Lough**, Ireland, in the province of Ulster, is the largest lake of the United Kingdom. It is situated about 12 miles west of Belfast, is 48 feet above sea-level, 18 miles long, has an average breadth of 10 miles, a maximum depth of 102 feet and an area of 153 square miles. It is well stocked with trout, char, pellen and other lake fish. It receives the waters of the Upper Bann, Blackwater and Callan, and is drained into the North Channel by the Lower Bann. The lough is connected by canals with Belfast, Newry and the Tyrone coal-field.

NEAGLE, nā'gl, **John**, American painter: b. Boston, Mass., 4 Nov. 1796; d. 1865. He was practically a self-taught artist although after

his marriage with the daughter of Thomas Sully he received instruction and encouragement from that painter. Applying himself to portrait painting he rapidly grew in favor with connoisseurs and was made director of the Pennsylvania Academy (1830), and in 1835 first president of the Artists' Fund Society of Philadelphia. Many of his most important works are at Philadelphia, where his parents had settled shortly after his birth. The full-length of 'Patrick Lyon at the Forge' (1826), and the portraits of Rev. Joseph Pilmore, Henry Clay and George Washington are strong in drawing, harmonious in coloring and strikingly characteristic.

NEAL, nēl, **Daniel**, English Non-Conformist clergyman and historian of the Puritans: b. London, 14 Dec. 1678; d. Bath, 4 April 1743. He studied at the Merchant Taylors' School, at a Dissenters' theological school in Little Britain, in Utrecht for two years and in Leyden for one; was assistant and then pastor of a congregation which met first in Aldersgate street and later in Jewin street; and wrote 'History of New England' (1720), which won him the honorary degree of M.A. from Harvard, and the great 'History of the Puritans' begun by John Evans but practically the work throughout of Neal (1732-38). The latter book won him a high reputation with the Non-Conformists, but is not free from bias. It brings the history of English Dissent down to 1689. Consult the 'Life of Neal' by Toulmin (1793).

NEAL, David Dalhoff, American painter: b. Lowell, Mass., 20 Oct. 1838; d. 2 May 1915. He began his studies at the Munich Royal Academy, where he gained the Great Medal. There he studied under Wagner. In 1869-76 he studied under Piloty. After 1879 he practised chiefly portrait painting. He painted many historical-romantic pictures and among them 'Mary Stuart and Rizzio'; 'Oliver Cromwell Visits John Milton,' in the Cleveland Public Library; 'Nuns at Prayer'; 'In the Crypt'; 'Retour du Chasse,' etc. Among his portraits may be mentioned those of Adolph Sutro, Rev. Mark Hopkins, Judge Hoffman of California, D. O. Mills, Whitelaw Reid and Teackle Wallis, in the Athenæum Club, Baltimore. There is little in his work that is distinctly American, his ideals and technique being of the Munich school.

NEAL, **John**, American author: b. Portland, Me., 25 Aug. 1793; d. there, 21 June 1876. He had little schooling; was a clerk in Boston; removed to Baltimore in 1816, began to practise law and write fiction. He contributed largely to British periodicals, lived in England 1823-27, being secretary to Bentham part of that time, and was the first successful American author abroad. He was (1838) one of the earliest speakers in behalf of woman's suffrage, was attracted successively by phrenology, mesmerism and spiritualism, and probably introduced gymnastics into America. Neal was the patron and guide of several younger writers, notably Edgar Allan Poe. Under the name Jehu O'Cataraht he wrote a bombastic poem 'Battle of Niagara' (1818). His novels include 'Randolph' (1823), in which he drew the portrait of William Pinckney so freely as to rouse Edward C. Pinckney to challenge the author;

'Brother Jonathan' (1825), and 'Rachel Dyer' (1828). He wrote the most of 'Paul Allen's American Revolution,' and much else with "marvelous rapidity." Consult his 'Wandering Recollections of a Somewhat Busy Life' (1869).

NEALE, Edward Vansittart, English reformer: b. Bath, England, 1810; d. 1892. He was educated at Oxford and became a Christian Socialist. He founded the first co-operative store in London and was instrumental in the establishment of numerous co-operative societies, mills, etc., and visited America in 1875 in the interests of his work and collected his observations in a paper called the 'Cooperative News.' He published 'The Characteristic Features of Some of the Principal Systems of Socialism' (1851); 'The Mythical Element in Christianity' (1873); 'A Manual for Cooperators' (1881), in collaboration with Thomas Hughes.

NEALE, John Mason, English clergyman and hymn-writer: b. London, 24 Jan. 1818; d. East Grinstead, Sussex, 1866. He was graduated from Trinity College, Cambridge, in 1840; became Fellow and tutor of Downing College in that year, and from 1846 until his death was warden of Sackville College, East Grinstead. His ecclesiastical views were those of the most advanced wing of the High Church party. In 1839 he was a founder of the Cambridge Camden Society, later the Ecclesiological Society, and in 1854 established at Rotherford the sisterhood of Saint Margaret, transferred in 1856 to East Grinstead. In rebuilding Sackville College chapel in 1850 he added ornaments denounced by Gilbert, bishop of Chichester, who inhibited him from officiating in the diocese, but the inhibition was removed in 1863. Neale is said to have known 20 languages. His greatest work was in hymnology. A translator of Latin and Greek Christian hymns he has perhaps never been equaled. Fully one-eighth of 'Hymns Ancient and Modern' (1878) is by him. Chief among his renderings are 'Mediæval Hymns and Sequences' (1851); 'The Rhythm of Bernard of Morlaix' (1858), and 'Hymns of the East Church' (1863). From the 'Rhythm' have been adapted the familiar 'The World is Very Evil,' 'Brief Life is here our Portion,' 'For thee, or dear, dear Country,' and 'Jerusalem the Golden.' He wrote also an important 'History of the Holy Eastern Church' (1847-51); 'History of the Jews' (1841); 'Stories for Children from Church History' (1850); 'Theodore Phranza, or the Fall of Constantinople' (1857), and others. In 1884 a selection from his writings was published. Consult Julian, 'Dictionary of Hymnology' (pp. 785-790, 1892).

NEANDER, nā-än'dër, Johann August Wilhelm, German theologian and church historian: b. Göttingen, 17 Jan. 1789; d. Berlin, 14 July 1850. A Jew, whose name was originally David Mendel. Upon his profession of Christianity in 1806 he assumed the name Neander ("new man"). After studying at Halle under Schleiermacher and at Göttingen, he became professor at Heidelberg in 1812, and in 1813 at Berlin. At Berlin he lectured until his death, largely on church history, but also on ethics, New Testament exegesis and systematic theology. His lectures were notable and his literary

activity great. He was the founder of modern church history, and beyond doubt the chief in that field in the 19th century. He viewed Christianity, not like either Supernaturalists or Rationalists, as a scheme of doctrine, but as a divine force; and its history as the study of human history in terms of that force. His principal work is the 'General History of the Christian Religion and Church' ('Allgemeine Geschichte der christlichen Religion und Kirche') (1825-52), translated by Joseph Torrey (12th ed., 1881), and more widely circulated in England and the United States than in Germany. This survey is based on a most careful use of the sources, and is marked by rigorous analysis. Neander's style here, as elsewhere, is somewhat involved at times, but free from pretentiousness. Schaff terms Neander "a giant in learning and a saint in piety." He wrote further 'Julian the Apostate' (1812; Eng. trans., 1850); 'Saint Bernard' (1813); 'Memoirs of the Christian Life in the Early and Middle Ages' (1822; Eng. trans. by Ryland, 1852); 'History of the Planting and Training of the Christian Church' (1832; Eng. trans. by Ryland, 1842); 'The Life of Jesus Christ' (1837; Eng. trans. by McClintock and Blumenthal, 1848), and other works. Consult Schaff 'Saint Augustin, Melancthon and Neander' (1886); Wiegand, 'Life' (1890); Harnack, A., 'Rede auf August Neander' (Berlin 1889).

NEANDERTHAL, Prussia, a valley or ravine near the village of Hochdal, between Düsseldorf and Elberfeld, which came into prominence in 1857 by the discovery in a limestone cave, at a depth of 60 feet, of the remains of a prehistoric man, of a hitherto unknown type. The peculiar dolichocephalic formation of the skull induced several anthropologists to regard it as typical of a separate race of cave dwellers, while others explained the abnormality as caused by disease during the lifetime of the individual; it is now regarded as a representative of the most ancient of European dolichocephalous people, of whom various remains have been found subsequently in Bohemia, France and England. See ANTHROPOLOGY.

NEAP-TIDES, from the Anglo-Saxon "nepfloed," low tide, are those which happen when the moon is nearly at the second and fourth quarters. The neap-tides are the lowest in the month as compared with their opposites, the spring tides. See TIDES.

NEAPOLIS, ne-äp'ō-lis, Macedonia, the town where Saint Paul, as mentioned Acts xvi, 9-11, commenced his evangelizing work in Europe. It was the port of Philippi eight miles to the west, and was situated on Kavala Bay, near the site of modern Kavala in Turkey.

NEARCHUS, ne-är'kūs, officer of Alexander the Great. He was a native of Crete and went to Amphipolis in the reign of Philip at whose court he formed a friendship with Alexander. Under the latter he was made governor of Lycia and other provinces in Asia Minor in 330 B.C. and about 329 B.C. accompanied Alexander in the Indian campaigns. In 326-5 he commanded the great fleet built by Alexander at Hydraspes and conducted it from the Indus to the Persian Gulf, discovering on his way the mouths of the Euphrates and the

Tigris. Upon the division of the empire which followed Alexander's death, Nearchus was made governor of Lycia and Pamphilia by Antigonus. He wrote an account of his voyage, which has been preserved in Arrian's 'Indica.' Consult Plutarch, 'Vita Alexandri'; Vincent, 'Voyage of Nearchus to the Euphrates'; McCrindle, J. W., 'Invasion of India by Alexander the Great' (new ed., London 1896).

NEARCTIC REGION, one of the primary faunistic divisions of the earth (see ZOOGEOGRAPHY) according to the widely accepted scheme of Schlater and Wallace. It embraces all North America; as far south as the highlands of Mexico carry northern climatic conditions. The differences between its fauna and that of the northern parts of the Old World (Palearctic Province) are, however, not sufficient, in the view of many students, to justify so primal a distinction; and the later tendency is toward uniting the Nearctic and Palearctic "regions" into one under the name Holarctic region, or Arctogæa. It is distinguished from the Palearctic province by the absence of the true mole, the scarcity of goats and sheep and the absence of flycatchers and the true starling.

NEARING, Scott, American sociologist: b. Morris Run, Pa., 6 Aug. 1883. He studied (1901-02) at the University of Pennsylvania Law School, took (1905) the degree B.S. and (1909) Ph.D. He was (1906-14) instructor of economics, then (1914-15) assistant professor at the University of Pennsylvania and instructor of economics at Swarthmore (Pa.) College. From 1915-17 he was professor of social science and dean of the College of Arts and Sciences at Toledo University. He was made chairman (1917-18) of the People's Council of America. After expressing strong views on the attitude of certain university trustees, he was dismissed by the University of Pennsylvania. Much newspaper and public discussion arose from the event. In 1918 he was defeated in the New York elections as Socialist candidate for Congress for the borough of Manhattan. He has written 'Economics' (1908), in collaboration with F. D. Watson; 'Social Adjustment' (1911); 'Solution of the Child Labor Problem' (1911); 'Wages in the United States,' 'Woman and Social Progress' (1912), with his wife; 'Special Religion' (1913); 'Social Sanity' (1913); 'Financing the Wage Earner's Family,' 'Income' (1915); 'Poverty and Riches' (1916). He has also written many articles to the journals and magazines.

NEARSIGHTEDNESS. See VISION, DEFECTS OF.

NEATH, nêth, South Wales, municipal borough and shipping port in Glamorganshire at the mouth of the Neath, seven miles northeast of Swansea, and on the Great Western and the Rhondda and Swansea Bay railways. It contains among its chief buildings eight churches, technical schools, the Gwyn Hall, town-hall, corn exchange and a busy market. The ruins of a castle and abbey dating from the 12th century exist on the east bank of the river. Its industries consist chiefly of copper smelting, tin-plate, galvanized iron and steel works, steam-engine works, iron and brass foundries,

brick and tile works, textile and chemical manufacturing. It has municipal water and gas works, slaughter-houses, traction lines, cemetery, library, etc. The park known as Victoria Gardens also belongs to the city. The town is said to be built on the site of ancient Nidum. Pop. 17,600.

NEAT'S-FOOT OIL, an oil obtained from the feet of the common ox.

NEBENIUS, nā-bā'nē-ūs, Karl Friedrich, German statesman: b. near Landau, Rhenish Palatinate, 1784; d. 1857. After studying law at Tübingen, he made himself acquainted with the Napoleonic methods of administration as a volunteer assistant to the prefect at Besançon, but would not accept a place in the French service. He became in 1807 private secretary in the Baden Ministry of Finance, in 1823 first councillor and in 1838 first president of the Ministry of the Interior. He supported a liberal policy, but the Absolutist party under Blittersdorf gained the ascendancy and he resigned office in 1839. He declined an offer from Frederick William IV of a high position in the Prussian service. On the fall of Blittersdorf he became again in 1845 Minister President. He retired in July 1849 and suffered in his last years from failing eyesight. Nebenius was the leader of reform in Baden for nearly 40 years, constructing the new constitution of the state in 1818, creating its railways, remodeling its taxation, introducing the metric system of weights and measures, organizing the system of popular instruction and regenerating the higher teaching, especially in the University of Heidelberg, of which he was curator. But his name is chiefly associated with his energetic and successful efforts for the establishment of the Zollverein. He studied its conditions, conciliated its opponents and devised a tariff for the general adoption of its component states so that he has been justly called its intellectual founder. He wrote 'Der öffentliche Kredit' (1820; 2d ed., 1829) and 'Der Deutsche Zollverein, sein System und seine Zukunft' (1835).

NEBO, nē'bō, Palestine, the biblical name of Jebel Neba, 2,643 feet high, a few miles east of the north end of the Dead Sea, the mountain of ancient Moab whence Moses viewed the Promised Land, and where he died (Deut. xxxii, 49; xxxiv, 1). The name seems to be the same as that of the Babylonian god. See NEBO.

NEBO, the patron deity of the city of Borsippa in Babylonia. The word *Nebo* is related to the Hebrew Nabhi, "Prophet." Nebo seems to have been the principal god of Babylon before the reign of Hammurabi (q.v.) about 2200 B.C. He was considered a chthonic deity and the regulator of procreation and the life of the newborn. He was worshiped as the god of wisdom, largely on account of the dominance of the priestly school at Borsippa. This wisdom had to do with astrological matters and with writing, and in the capacity of the god of writing Nebo was considered as lord of the tables of fate. As Nebo was regarded as the son of Marduk, who was considered as the true arbiter of human fate, Nebo became the scribe of his father. The homage of Nebo to Marduk was symbolized in the New Year celebration. The temple of Nebo in Borsippa was known as E-Zida, and a similarly named

sanctuary existed in the temple of Marduk at Babylon. Nebo was identified with the planet Mercury. Tashmit was the name of his consort. The Assyrians worshiped Nebo rather than Marduk as the representative of Babylonia. Traces of Nebo worship are found in Arabia, as in the name of the Nabatæans (q.v.), and especially among the Mandæans, where Enba is Jesus, the false Messiah. The name Nebo is a component of many biblical names, such as Nebuchadnezzar, Nebushar-adan, Nebushashban and Abednego. Consult an article by Condamin in Huby, J., 'Christus' (Paris 1912); Jastrow, M., 'Religion of Babylonia and Assyria' (Boston 1898); id., 'Die Religion Babyloniens und Assyriens' (Giessen 1902-12); Jeremias, A., 'Das Alte Testament im Lichte des alten Orients' (Leipzig 1906); Zimmern, in Schrader, E., 'Die Keilinschriften und das alte Testament' (3d ed., Berlin 1902).

NEBRASKA, nē-brās'ka (by act of its legislature, 4 April 1895, styled "Tree Planters' State"), a north central State admitted to the American Union 1 March 1867, is bounded on the north by South Dakota, on the west by Wyoming and Colorado, on the south by Colorado and Kansas, on the east by Missouri and Iowa. The Missouri River separates it from Missouri, Iowa and South Dakota on the east and northeast. Capital, Lincoln. Area, 77,510 square miles, of which 702 are water. Pop. (1920) 1,296,372.

Topography.—Nebraska is in the centre of the great grassy plain stretching from Hudson Bay to the Gulf of Mexico. Its dominant surface characteristic is an undulating prairie sloping upward from the Missouri River to the foothills of the Rocky Mountains with an average rise of about eight feet to the mile. About three-fourths of its area is a rich prairie including all the central and southern part of the State. "Mountain Nebraska" is comprised in an area about 100 miles square in the northwest corner. Here the Pine Ridge and the Wild Cat Range rise to altitudes of 4,000 to 5,000 feet, partly covered with pine and cedar and deeply divided by canyons and mountain valleys. Below the higher peaks lie table-lands interspersed with groves of pine, forming the "park country." The highest point in the State, 5,300 feet, is near the Wild Cat Range in Banner County. In the extreme northwest corner is a section of "Bad Lands," fantastic hills and terraces nearly destitute of vegetation, exhibiting great variety of colored earths and rocks. These regions of northwest Nebraska are picturesque and scenic to a high degree. Nearly level elevated plains with altitude of about 4,000 feet, whose principal areas are called Box Butte plains and Cheyenne plains, lie east and south of the mountain foothills. East of these high plains a sandhill region of 15,000 square miles extends like an open fan diagonally, the handle in the southwest corner of the State and the open fan in the central northern part. These sandhills are covered with grass and include many rich, well-watered valleys. The typical prairie slopes gently from the sandhills toward the Missouri River broken by a range of low hills running parallel to the river.

River Systems.—Three river systems, the Niobrara, the Platte and the Republican, all flowing southeast into the Missouri River, dom-

inate the drainage system of the State. The Platte is the central and principal one. Its valley is the leading feature of Nebraska's geography and topography. From five to 20 miles in width, it is a natural route with easy grades and undulating landscape from the Missouri River to the Rocky Mountains. The overland trails, the Union Pacific Railway and the Lincoln Highway have each made use of the natural advantages of this valley for a great central route across the continent. The sources of the Platte are in the continental divide of the Rocky Mountains in Wyoming and Colorado, and its extreme length is about 700 miles. The channel of the Platte for a large part of its course is from half a mile to a mile in width, with water ranging from a few inches to several feet in depth and with thousands of islands of all sizes giving beauty and variety to its course. The Niobrara River rises in the plains of eastern Wyoming and flows for about 450 miles east to its junction with the Missouri. Its upper course is through gently sloping plains, its middle section through a wild and picturesque canyon bordered by rugged pine-clad hills abounding in rapids and cascades; its lower part through a widening valley. The Republican River rises in the high plains of eastern Colorado and runs for about 200 miles east through the southern tier of Nebraska counties until, turning south into Kansas, it unites with other streams to form the Kansas River. Besides these principal rivers there are the Loup and Elkhorn, with their tributaries, rising in the central sandhills region and flowing southeast to unite with the Platte. They are remarkable for the clearness and purity of their waters, for the regularity of their volume throughout the year and for their undeveloped water power. The Great and Little Nemaha rivers drain the southeastern corner of the State, uniting with the Missouri very near the State line. The Big Blue, Little Blue and the West Blue rivers are part of the Republican system draining the south central counties. The White River is a beautiful mountain stream in the extreme northwest for about 40 miles through Nebraska before it turns north into South Dakota. Scattered over the sandhill section is a multitude of small lakes, which have been the homes and breeding-places of waterfowl for centuries.

Water Supply.—The State has an abundant supply of pure water found in the valleys at depths ranging from 10 to 50 feet and upon the table-lands at from 50 to 250 feet. The great majority of wells are less than 100 feet in depth. The underground waters are found in beds of sand or gravel which underlie nearly the entire State and through which the water moves slowly in a volume so great that pumping does not exhaust the wells. This water supply is partly from the melting snows of the mountains, partly from the seepage of the rivers and partly from the rainfall which is rapidly absorbed by the porous subsoil. Breaking the prairie and irrigation have increased this absorption so that the water-table is in many places nearer the surface than it was before white settlement. Artesian wells are found in 40 counties. The deepest artesian well is at Nebraska City, 3,000 feet, while the best known, the test well, is the salt basin near

Lincoln, 2,463 feet in depth. There are two principal areas of deep artesian wells, one in the southeast, the other in the northeast. In the southeast a strong flow of water is found at depths ranging from 1,000 to 1,800 feet, in the carboniferous rock, sometimes impregnated with salt. Both Lincoln and Omaha have flowing wells from this formation. In the northeast, artesian water is found at depths ranging from 200 to 800 feet in the Dakota sandstone accompanied with high pressure. Such wells in Boyd and Knox counties furnish power for flouring mills and electric-light plants. The areas of shallow artesian water are widely scattered. Flowing wells are found at depths ranging from 30 to 100 feet below hard beds of clay and furnish water for irrigation, for artificial lakes and for power and domestic purposes.

Climate and Rainfall.—The climate is characterized by mild, dry atmosphere, clear skies and perennial breezes. The chief factors in its climate are its middle latitude in the north temperate zone, its middle altitude between sea-level and mountain height, the wall of the Rocky Mountains on the west and the open plains stretching to the Gulf of Mexico and Arctic Ocean, from which is borne upon winds the greater volume of moisture which falls in the form of rain upon the State. The average temperature of the entire State through the year is 48.5°. At the altitude of 900 feet in southeast Nebraska the average is 52°, while at the altitude of 3,000 feet in northwest Nebraska the average of 45°. The fall in average temperature is at the rate of about 1° for each 38 miles north in most of the State. As a rule there are but two cold months in the year, January and February, with a mean average temperature of about 20°. Occasional cold waves carry the mercury to 10 and 20° below zero with rare cases of 40° below. In the main, the winters are dry and bright, with little snowfall. July, August and the first 10 days of September constitute the heated term with a mean temperature of 70° to 78° and with almost continual breezes. Killing frosts occur in the average year from 25 September to 10 May in the northwestern part of the State and from 5 October to 25 April in the southeastern part of the State. The growing season for farm and garden crops is thus about 160 days in the southeast and 130 days in the northwest. Records of rainfall in the Nebraska region began at the United States military posts, Fort Laramie and Fort Kearney, in 1849 and are the oldest records in the plains and mountain region of the West. About 1866 systematic rainfall records began in eastern Nebraska and the Platte Valley. Allowance being made for the limited extent of the earlier observations the record of nearly 70 years indicates an average annual precipitation for the State as a whole of 23.67 inches. At the Missouri River the average annual rainfall is 30 inches, decreasing at an average of 1 inch for each 30 miles west until an average of 15 inches is reached at the Wyoming border. The snowfall averages about 25 inches, equal to about 2½ inches of water, leaving a little over 21 inches average rainfall. Compared with an annual precipitation of 35 to 40 inches in the eastern part of the Mississippi Basin this seems inadequate for agriculture. An important dif-

ference exists in the fact that in Nebraska 46 per cent of the annual rainfall occurs in the growing months of May, June and July, enabling crops to be raised with a far less precipitation than in States farther east where a great part of the moisture falls in the winter months. This important discovery with reference to precipitation and growing-crops was first published by Robert W. Furnas, secretary of the Nebraska Board of Agriculture, in 1873. The four winter months, November, December, January and February are dry months having only 11 per cent of the total annual precipitation. The rainfall for the crop season, April to August, inclusive, averages 16.18 inches for the entire State. Before the advent of the plow a large part of the summer rainfall ran off from the compact, thick sod which covered the greater part of Nebraska. Ploughed fields now absorb a large part of this run-off so that while the records show no material increase in the rainfall a far larger per cent remains in the soil. The average number of clear days in Nebraska is 193. Records kept for a number of years show that in the bright months of July and August the sun shines on an average three-fourths of the 15 hours it is above the horizon each day. A study of rainfall diagrams from 1850 to the present time shows, in that period, two groups of years with scanty rainfall, the first covering the years 1860-64, the second the period 1890-94. Throughout the remainder of these 68 years the rainfall is close to normal with eight years of large excess above normal. Prevailing winds are from the northwest from October to April; from the south and southwest during the remainder of the year. Average hourly wind movement is nine miles per hour.

Farming and Stock-Raising.—Nebraska is one of the great agricultural States of the Union. Corn is the leading crop, the average production thereof during the 12-year period, 1910-21 inclusive, having amounted to 186,968,166 bushels per year. Hay and forage, oats, wheat, barley and rye are also grown in large quantities. The acreage, production and value of the principal crops grown in 1922 are shown in the following table:

CROPS	Acreage	Bushels	Value
Corn.....	7,296,000	182,400,000	\$105,792,000
Winter wheat....	3,942,000	57,159,000	54,873,000
Spring wheat....	235,000	2,679,000	2,572,000
Oats.....	2,408,000	56,106,000	14,711,000
Barley.....	242,000	4,356,000	2,047,000
Clover seed.....	8,000	22,000	220,000
Buckwheat.....	1,000	16,000	14,000
Rye.....	188,000	2,106,000	1,369,000
Sorghum syrup..	2,000	(Gals.) 166,000	158,000
Potatoes.....	139,000	11,676,000	5,488,000
Flaxseed.....	3,000	24,000	46,000
Hay, tame.....	1,533,000 (Tons)	3,323,000	37,218,000
Hay, wild.....	2,208,000 (Tons)	1,877,000	15,954,000
Grain sorghums..	19,000	342,000	253,000

The figures above given are the estimates of the United States Department of Agriculture. The Census Bureau's report for the year 1919 gave the production of the important crops as follows: Corn, 160,391,314 bushels valued at \$216,528,274; oats, 59,819,545 bushels valued at \$44,864,671; wheat, 57,843,598 bushels valued at \$124,363,735; barley, 4,405,323 bushels valued at \$4,845,864; rye, 3,259,390 bushels valued at \$4,563,143; hay and forage, 6,619,001 tons valued at \$96,965,224; potatoes, 4,452,497 bushels valued at \$10,685,998. The value of all farm crops in the census year was \$519,729,771.

The livestock on the farms of the State on 1 Jan. 1923, according to the United States Department of Agriculture, was as follows:

ANIMALS	Number	Value
Horses.....	901,000	\$52,258,000
Mules.....	114,000	7,980,000
Cattle:		
Milch cows.....	570,000	32,490,000
Other cattle.....	2,700,000	85,860,000
Sheep.....	733,000	5,337,000
Swine.....	4,232,000	50,784,000

The native grasses of Nebraska comprise 113 species and constitute one of the peculiar assets of the State, attractive to the botanist and valuable to stockmen. One of the principal pop-corn areas in the United States is in Valley County. The number of farms in the State in 1920 was 124,417 of which 69,672 were farmed by owners and 53,430 by tenants. The increase in tenant farming is largest in the region of highest priced lands. Out of a total area of 49,157,120 acres, 42,225,475 acres are in farms and of these 23,109,624 are improved. The total value of farm property by the United States Census of 1920 was \$4,201,655,992, of which \$3,330,222,340 was land value. The average number of acres per farm was 339.4 and the average value of land per acre \$78.87. The value of land per acre nearly trebled in the 10 years between 1900 and 1910, and has nearly doubled again since 1910. The economic unit for maximum profit in food production in Nebraska agriculture increases in size with the introduction of improved machinery. At present it is about 160 acres in eastern Nebraska, 320 acres in the mixed farming regions of western Nebraska and 3,000 acres in the livestock region.

Fruit-Growing and Forestry.—Nineteen-twentieths of Nebraska was originally treeless prairie. Tree planting and cultivation is the first step in making a desirable home. It is estimated that over 500,000 acres have been planted to forest trees and about 100,000 acres to fruit trees and small fruit. The total area now covered by trees is between 1,000,000 and 2,000,000 acres. In 1922 the United States Department of Agriculture estimated Nebraska's apple crop at 1,620,000 bushels. Commercial orcharding is developing rapidly in the southeastern quarter of the State, while cherries, apples, plums and small fruits flourish in every county.

Irrigation and Water Power.—The flowing waters of Nebraska are applied in two ways to production—the irrigation of land and the development of power. Irrigation is applied chiefly in the western third of the State where the rainfall is between 15 and 20 inches. Irrigating ditches were constructed as far back as 1856 but the development of the system followed the drought of 1890. The broad valleys of the Platte and the Republican are the principal irrigated areas. There are about 2,700 miles of canal with 1,100,000 acres under them, of which about one-third is cultivated. Alfalfa, sugar beets and potatoes are leading crops in the irrigated region. The largest irrigation projects are in the valley of the North Platte under canals constructed by the United States, deriving their waters from an immense reservoir called the Pathfinder, which stores the waters from the melting snows of Colorado and Wyoming to the amount of about one million acre feet. It is estimated that

about 300,000 horse power may be developed from the flowing waters of Nebraska streams. About nine-tenths of this power, which includes the most important sites, is now undeveloped. The conversion of water power into electricity for light and power purposes is making progress in the more thickly populated portions of the State.

Dry Farming.—In the same region where irrigation is most largely practised the new methods and machinery known as the dry farming system are applied to land which cannot be irrigated. These methods include summer fallowing and surface cultivation to impound the rainfall in the soil for growing crops. Experiments at North Platte have shown that crops draw moisture from a depth of six feet during the growing season. Phenomenal results have followed these new methods during the past decade and over a large part of the high plains production of cereals and alfalfa has been generally successful while land values have risen from \$1 per acre to \$50 and over.

Geology and Soil.—The geological structure is of simple type. Nearly the entire surface of the State is covered with a mantle of soil, in many places over 100 feet in thickness. The upper section of this mantle is a black or brown alluvium from three to six feet deep. Beneath the alluvium, over the greater part of the State, lies a subsoil of loess clay varying in thickness from a few feet up to 100. This loess subsoil, porous, fertile and spongy, is one of the chief assets of agricultural Nebraska, absorbing rainfall readily and giving it up to growing crops. Beneath the loess subsoil of the eastern part of the State lies a heavier clay and broken rock derived from the ice sheet which once covered this region and known as till or glacial drift. In the sand hill region the mantle soil is composed of sand and silt derived from Tertiary rocks broken down by action of water, heat and cold and blown by the winds into their present form and location. The rock formations which lie beneath this mantle of soil extend from the Rocky Mountains eastward. They are exposed in the west by the uplift of the mountains and in the east at a few places where water courses have cut valleys through them. Over the greater part of the State they are buried beneath the mantle of soil and subsoil. The principal sedimentary rock formations underlying the State, considered in the order of the oldest and deepest upward, are as follows: Carboniferous limestone and shale are exposed in many places in southeastern Nebraska. In the adjoining States, Iowa, Missouri and Kansas, thick beds of coal are found in this formation. Nebraska is at the western edge of coal-bearing strata with unimportant coal workings at two or three places. Limestone, rubble and clay are the chief products of the carboniferous here and their use for concrete, brick, road-building, smelting and sugar refining is rapidly increasing. Cretaceous sandstones and shales lie next above the carboniferous and outcrop at a number of points in northeast and southeast Nebraska. The Dakota sandstone, the principal member of this group, is commonly rusty-red in color and carries a large water supply in which are found some of the most notable artesian wells. It

furnishes superior clay for brick-making and important sand and gravel pits. The Benton shales and chalk rock are above the Dakota sandstone. Fine exposures of such rock are found along the Niobrara and Republican rivers. The chalk rock is soft when first cut but hardens on exposure to the air and is used to a limited extent for building. It is now being developed in the manufacture of hydraulic cement. The Pierre shales are above Niobrara chalk rock and cover a large part of the State, in many places to a depth of 1,000 feet. They are alkaline and where exposed produce the soil called gumbo. In western Nebraska three distinct formations later than the cretaceous appear. These are the Oligocene clays and shales, the Arikaree Butte sands and clays and the Ogallala magnesia or mortar beds. The first is about 1,000 feet thick and appears exposed in the bad lands of the extreme northwest corner. The second is five or six hundred feet thick and gives rise to the remarkable buttes or isolated precipitous peaks which are such conspicuous and picturesque features of the western plains. The third gives a rugged variation to the line where the high valleys pierce the table-lands and furnishes stone for building purposes and road work. The fossil deposits of northwest Nebraska are among the most remarkable in the world. The principal museums of the world have here secured some of their most valuable skeletons of the ancient rhinoceros, tapir, sabre-toothed tiger and dinosaurus.

Manufactures.—The abundant supply of free farming land determined both labor and capital to agriculture until after 1890. By that time the best farming land to the furthest border had been taken by settlers. The great drought and hard times which followed drove thousands to the cities for temporary employment. Since then manufacturing industries have steadily grown. The leading manufactures are those which rest directly upon agriculture. The principal industry is slaughtering and meat packing. Milling grain products ranks next, butter and cheese-making third. The beet sugar industry has made remarkable progress in recent years. Since 1920 five factories have been in operation in the State. In 1921 they turned out 57,000 short tons of sugar; in 1922, 41,000 tons. In 1909 the sugar beet crop of the State amounted to but 39,756 tons grown on 4,182 acres. In 1921 the crop was 773,000 tons from 72,000 acres, and in 1922, 688,000 tons from 55,000 acres. Returns from all lines of manufacturing for 1919 are:

Number of manufacturing establishments.....	2,884
Proprietors and firm members.....	2,916
Salaries employees.....	9,639
Wage earners.....	36,521
Primary horse power.....	125,814
Capital.....	\$245,256,684
Salaries.....	\$15,741,937
Wages.....	\$46,066,755
Cost of materials.....	\$480,774,122
Value of products.....	\$596,042,498
Values added by manufacturing.....	\$115,268,376
Per cent of increase of value of products....	169.0

The manufacture of potash and other salts from the waters of alkali lakes in the sand hills section of northwestern Nebraska began in an experimental way in 1912. The Great War cut off the supply from the Stassfurt

mines of Germany, the world's greatest potash source. The price of potash rose about 1,000 per cent. Nebraska's alkali lakes became the largest producers of potash for the American market. Several millions of dollars have been invested and the production for 1918 is estimated at 150,000 tons. About 2,000 men are employed in the industry and several towns have sprung up in the sand hills supported thereby.

Transportation, Communication, Etc.—

The first transcontinental railway in the world, the Union Pacific, has headquarters in Omaha, Neb.

Five great railway systems now traverse the State—Chicago and Northwestern, through the north; the Union Pacific through the centre; the Burlington extending into 76 of the 93 counties; the Rock Island and the Missouri Pacific in the southeast; only three counties in the State are without railroads within their borders. Outside the sand hills, railroad stations are rarely more than 10 miles distant from any farm. Omaha and Lincoln are the chief railroad centres. The mileage of the principal railroads in 1916 was as follows:

Chicago, Burlington and Quincy.....	3,601.16
Union Pacific.....	2,104.60
Chicago, Rock Island and Pacific.....	308.30
Chicago and Northwestern.....	1,306.29
Missouri Pacific.....	483.93
Chicago, Saint Paul, Minneapolis and Omaha....	375.66
Saint Joseph and Grand Island.....	131.62
Omaha Bridge and Terminal Railway.....	17.57
Missouri Valley and Blair Railway and Bridge....	2.86
Total.....	8,331.99

In 1916 there were 389,991 miles of telephone wire in the State; 204,042 telephone instruments installed; 33,390 city subscribers and 42,221 farm subscribers. The total book cost of telephone systems shows \$21,135,314; the gross earnings for the year were \$5,003,209 and operating expenses \$3,382,054.

The use of motor vehicles and good roads movements are transforming the transportation business. The smooth prairies and moderate rainfall secure smooth highways at small cost. Nebraska is among the leading States in the Union in the number of motor vehicles per capita of population, having over 256,650 or one to each five in population in the year 1922. There are about 300,000 miles of public highways. Three principal transcontinental motor highways cross Nebraska—the Lincoln Highway up the Platte Valley, the Omaha-Lincoln-Denver Highway across the prairies of southern Nebraska, the Meridian road running north and south from Winnipeg to the Gulf of Mexico. Numerous other motor highways are now chartered and marked upon posts and telephone poles. In 1911 the legislature made the first levy for a State aid bridge fund. This produces about \$100,000 per year to defray half the cost of important bridges, the other half being borne by the counties where they are located. The legislature of 1917 appropriated \$640,000 for the biennium to be expended in connection with the Federal appropriation for road construction in the State. This is in addition to the usual expenditures by counties, cities and road districts.

Revenue and Finance.—Under the Nebraska constitution, adopted in 1875, the gen-

eral property tax is the principal source of State revenue. From 1875 to 1913 total appropriations for State expenses were about \$70,000,000, of which \$3,100,000 was collected as fees. The balance on hand 1 July 1921 was \$2,228,523; receipts in 1921-22 were \$15,345,536; total, \$17,574,059. Disbursements were \$13,564,191. Balance 30 June 1922, \$4,009,868. Under the Nebraska Revenue Law property is assessed at one-fifth its actual value. This valuation for 1922 was \$3,171,747,870, of which \$862,116,791 was personal and \$2,329,631,079 was real property. The State has no bonded indebtedness.

Banks.—There are two systems of banks, State and national. Since the passage of the State Bank Guaranty Law in 1909 the number and the deposits of State banks have increased more rapidly than the national banks. The data for national banks in September 1922 was as follows:

Number of banks.....	182
Capital.....	\$17,245,000
Total deposits.....	\$200,008,000

STATISTICS OF STATE BANKS 30 JUNE 1922

Number of banks.....	970
Capital.....	\$25,255,000
Total deposits.....	\$225,647,000

Education.—Since 1880 Nebraska has been one of the three States with lowest percentage of illiteracy in the Union. In 1890 Nebraska was lowest with a percentage of 3.1; in 1900 Nebraska tied with Iowa with a percentage of 3.3; in 1910, Nebraska was 1.9 to Iowa's 1.7; in 1920, 1.4 to Iowa's 1.1. For the school year (1919-20) there were in the State of school age (5-20 years), 414,822 children; enrolled in school, 292,747; average daily attendance, 232,515. Average duration of school, 164 days.

According to the 'Statistical Abstract,' published by the United States Department of Commerce, the number of teachers employed in the public schools of Nebraska in 1919-20 was 14,873, of whom 1,084 were males and 13,789 were females. Salaries paid teachers totaled \$10,907,631 or an average of about \$765 per teacher.

The total expenditure of all kinds for support of grade and high schools was \$20,452,569. There were 91 city schools and 368 high schools accredited to prepare students for the State University. Pursuing higher courses of study in colleges and technical schools were 4,402 men and 3,037 women (1915). College students in law, 400; in medicine, 274; in engineering, 308; in agriculture, 255. There are four State normal schools—at Peru, Kearney, Wayne and Chadron, having a total of 172 teachers and 3,652 students.

The State University comprises the colleges of Literature, Science and Arts; Agriculture; Medicine; Law; Teachers; Graduate and Engineering, located at the city of Lincoln except the College of Medicine located at Omaha. The College of Agriculture, a school of agriculture and an experiment station are located on the university farm campus with outlying experiment stations at North Platte, Scottsbluff and Valentine and a school of agriculture at Curtis; all under government of board of six regents elected by the voters of the whole State. Statistics of the University

for the fall of 1922-23 are as follows: students, 3,331 men, 2,114 women; instructors numbered 368; library, 155,000 titles. The income of the University for the year including extension work and experiment stations was \$2,966,271. The University received from the United States government an endowment of 45,426.08 acres of land and the agricultural college a similar endowment of 89,148.60 acres. Of these endowments there remain unsold 24,859.70 acres, valued at \$175,000. The cash endowment arising from the sale of this land amounts to \$840,127.79. Under the present law no more of the land may be sold. The university farm campus consists of 320 acres, distant about three miles from the university city campus of about 40 acres in the heart of Lincoln. There were 1,007 students enrolled in the military cadet battalion (1918). Nebraska's school land policy differs from that of other States in the Union. Under the act of 1897 no further sales of either common school, university or agricultural college endowment lands may be made, except for certain minor purposes. The common school lands granted to Nebraska amount to 2,978,095 acres. Of this there remain unsold 1,650,990 acres. From the lands already sold there is an endowment of \$9,034,308, which is being constantly increased by payments on land sale contracts. The total common school endowment is estimated at about \$12,000,000 from lands sold and the value of the remaining land is at least \$20,000,000 more. It is the belief of those who champion the permanent leasing system that the increase in school land values arising from increased population should properly be appropriated for the education of school children.

There are about 30 denominational colleges, academies and about 200 parochial schools in the State. College degrees are granted by the following:

NAME	Denomination	Location
Bellevue College....	Presbyterian.....	Bellevue
Cotner University....	Disciple.....	Bethany
Creighton.....	Roman Catholic.....	Omaha
Doane College.....	Congregational.....	Crete
Fremont Normal College.....	Private management.	Fremont
Grand Island College.....	Baptist.....	Grand Island
Hastings College....	Presbyterian.....	Hastings
Luther College.....	Lutheran.....	Wahoo
Nebraska Wesleyan University.....	Methodist Episcopal.	University Place
Union College.....	Adventist.....	College View
York College.....	United Brethren.....	York

Religion.—The latest United States census figures on religious affiliation are those of 1916. Considerable changes have occurred since then but not greatly altering the relative denominational strength. The total number of church members was 440,791; total number of church buildings and of ministers each, about 3,500. The strength of the principal denominations was as follows: Roman Catholics, 135,537; Methodists, 81,879; Lutheran, 66,906; Presbyterian, 26,333; Disciples of Christ, 19,613; Baptist, 19,643; Congregationalists, 19,423; Protestant Episcopal, 7,931; United Brethren, 6,086; Latter Day Saints, 1,568. There is a difference in the basis of these membership figures as compiled by the denominations, the Roman Catholics counting as members all children baptized in the church while Protestant denominations do not.

Charitable and Penal Institutions.—In May 1918 the population of State institutions was as follows:

Hospitals for insane:	
Hastings.....	1,152
Lincoln.....	782
Norfolk.....	634
Penitentiary (Lincoln).....	311
Industrial schools:	
Boys (Kearney).....	219
Girls (Geneva).....	100
Industrial Home for Women (Milford).....	103
Soldiers' and Sailors' Home:	
Grand Island.....	445
Milford.....	109
Feeble-minded institute (Beatrice).....	572
School for deaf (Omaha).....	173
School for blind (Nebraska City).....	55
Hospital for tuberculosis (Kearney).....	84
Home for dependent children (Lincoln).....	42
Orthopedic hospital (Lincoln).....	63
Total.....	4,844

The total appropriations for their maintenance during the biennium ending 31 March 1917, approximately \$2,800,000. All these institutions are under the government of a board of control consisting of three members appointed by the governor and confirmed by a two-thirds vote of the senate. Besides the board of control there is a State board of charities and corrections consisting of the governor, the State superintendent, and the State land commissioner with a chief secretary. This board has general power to investigate and report upon the condition of all penal and charitable institutions, public and private, State and municipal. There are 54 county poorhouses in the State with about 450 inmates. Under a Mothers' Pension Law enacted in 1913 about 3,500 cases of relief were cared for between July 1915 and January 1917, at an estimated cost of \$200,000.

Libraries.—In the State are 117 public libraries with 739,476 volumes. The first public library act was passed in 1875. In 1911 an act was passed providing for township and county libraries; also an act appropriating \$5,000 for libraries in the charitable and penal institutions of the State, except the school for the blind, and a trained librarian placed in charge.

The total number of persons upon the State's payroll is 2,568 of whom 825 are in State institutions, 351 in State departments and 1,743 in the State courts, normal schools, university and extension departments.

State and County Government.—The present constitution, adopted in 1875, is sometimes styled the "Grasshopper Constitution," because the grasshoppers and hard times of that period resulted in a very economical and restricted form of constitution. It is one of the few State constitutions requiring a majority of all the votes cast to adopt an amendment proposed by the legislature. A constitutional convention to revise and amend the constitution convenes 2 Dec. 1919. It will consist of 100 members elected on a non-partisan ticket by the representative districts. The legislative body consists of a senate of 33 and a house of 100 members. Regular sessions convene in January of odd-numbered years. Members are elected for a period of two years and receive \$600. The executive departments and salaries are as follows:

Governor.....	\$2,500
Lieutenant-governor (for two-year term).....	1,200
Secretary of state.....	2,000
Auditor of public accounts.....	2,500
Treasurer.....	2,500
Superintendent of public instruction.....	2,000
Attorney-General.....	2,000
Commissioner of public lands.....	2,000

Each of the above is elected for a two-year term. The State treasurer is eligible to succeed himself after two consecutive terms. The constitution forbids the creation of any other executive offices, with the result that the provision has been avoided by the creation of numerous boards composed of some of the foregoing executive officers, with provision for the employment of secretaries who perform the new duties arising from social changes. In 1907 a railway commission consisting of three members elected by the people for a three-year term with a salary of \$3,000 per year was added by constitutional amendment to the above list. The judicial department consists of seven judges elected by the people, holding office for six years at a salary of \$4,500 per year. In addition there are three Supreme Court commissioners at \$3,000 per year appointed by the Supreme Court to assist it in preparing opinions. There are 18 districts in which are elected 32 district judges, each for a four-year term at a salary of \$3,000 per year. There is besides in each county a county judge elected for a two-year term at a salary varying with the population of the county. County government may be under the township or the commissioner system as the voters choose. There are now 28 counties under township and 65 under commissioner system.

COUNTIES AND COUNTY SEATS.

Adams, Hastings.	Jefferson, Fairbury.
Antelope, Neligh.	Johnson, Tecumseh.

Holt, O'Neill.	Wheeler, Bartlett.
Hooker, Mullen.	York, York.
Howard, Saint Paul.	

Cities and Municipalities.—The first incorporated city or village was Nebraska City, incorporated by special act of the Territorial legislature 2 March 1855. Until 1864 each incorporated municipality secured its charter by a separate act of the legislature. The commission plan of government was provided by act of 7 April 1911, known as the Banning Act. The "Home Rule" amendment to the State constitution of 1912 provided that any city of more than 5,000 may frame and adopt its own charter consistent with the laws and constitution of the State. There are 460 incorporated cities and villages in Nebraska. Of these 169 own waterworks systems and nine have corporation-owned systems; 51 own electric-light systems, while 77 have corporate-owned systems; eight own their own gas plants and 26 have corporate systems. The population of the principal cities at the census of 1920 is as follows:

Omaha (including South Omaha).....	191,601
Lincoln.....	54,934
Grand Island.....	13,960
Beatrice.....	9,664
Hastings.....	16,647
North Platte.....	10,466
Fremont.....	9,605

Politics.—The struggle over the Nebraska-Kansas bill gave birth to the Republican party in 1854, but there was no Republican party organized in Nebraska until 1858. The Territory was strongly Democratic until 1860 when the veto of the Free Homestead bill by President Buchanan and the pro-slavery attitude of the Democratic party gave the Republicans control which they held without interruption down to 1890. The fundamental political issue in the State from 1870 was railroad control. Failure to furnish a solution of the problem brought about factionalism in the Republican party. The Farmers' Alliance, beginning in 1881 as a social and educational organization, became in 1890 the leader of new economic issues and drove the Republican party from its position of supremacy in the State. The Farmers' Alliance movement became the People's Independent, or Populist, party, which for the next five years was the chief rival of the Republican party in the State, the Democratic party being faction torn between its conservative elements following the leadership of President Grover Cleveland and J. Sterling Morton, and the Progressive or Free Silver element under the leadership of William J. Bryan, who was elected to Congress in 1890 and in 1892. The triumph of the free silver wing of the Democratic party in 1896, accompanied by the nomination of W. J. Bryan for President, was followed in Nebraska by a fusion of Populists and Free Silver Democrats which elected an entire State ticket and both houses of the legislature that year, and continued in power until 1900 when the Republicans again carried the State. Continued fusion of the Populists with the Democrats aided in the gradual disintegration of the former party. The nomination of a conservative Democrat for President in 1904 and the progressive policies of President Roosevelt drew a considerable portion of the Populists into support of the Republican party. Between the competition of the Bryan Democracy and Roosevelt Republicanism in the adoption of Populist principles and bidding for Populist votes the party rapidly went to pieces and disappeared about 1912. The split of the Repub-

lican party in that year between Roosevelt and Taft gave the Democratic party a new lease of power in Nebraska as elsewhere which it held until 1918.

"stuffed" census. A great real estate boom and a pending prohibition amendment each demanded a large showing of increased population from the Federal supervisors of the census, one as a basis for inflated real estate

NEW STATE CAPITOL, LINCOLN, NEB.

The foundation was begun 15 April 1922 and the contract for the first section of the superstructure was awarded July following. The building is to be four-square, approximately 400 x 400 feet. From the centre will rise a tower over 400 feet high on top of which will be a 22 foot figure of "The Sower", typifying the spirit of the State. The exterior will be of buff Indiana limestone. Five million dollars has been appropriated for its construction, exclusive of power plant, grounds and furnishings. All sculpture will be by Lee Lawrie

values, the other as a basis for an inflated anti-prohibition vote. It is a conservative estimate that this census added 100,000 to the actual population of Nebraska under pressure from these influences. A present tendency is toward an increase in population of the cities and a decline in the population of the country precincts. Fourteen counties in eastern Nebraska show an actual falling off in population between 1900 and 1910, due chiefly to consolidation of farms made possible by improved machinery, to the migration of younger people to the cities and older people to the towns where they form the class known as retired farmers living upon the rental of their farms.

A study of the elements of the present population is shown in table on preceding page.

History.—Prehistoric.—In the Missouri River region and in the Bad Lands of the northwest are ancient aboriginal remains consisting of mounds, buried fire-places, flint workings and lodge circles. In 1804 Lewis and Clark described ancient earthworks found on Bonhomme Island in the Missouri River. Since 1900 excavations have disclosed skeletons, pottery, bone and flint implements at depths of from 5 to 10 feet in many places. Articles found are of different type from those used by Nebraska Indians since the coming of white men. The discovery in 1906 at Long's Hill, eight miles north of Omaha, of human skulls with low cranial development in position indicating possible burial in pre-glacial time, raised the question of man in Nebraska before the ice sheet.

Indian Tribes.—The first white explorers found Nebraska occupied by the following tribes: Otoe, Omaha and Ponca along the Missouri River. The Otoe numbered about 3,000, the Omahas about 3,000, the Ponca about 2,000. All three were Siouan tribes speaking dialects of the same language. The Pawnee nation numbered about 10,000 and occupied the central part from the Loup rivers to the Republican. They were divided into four bands, the Skidi, Panimaha or Loups, the Chaui or Grand Pawnee, the Kitkehako or Republican and the Pitahauerat or Noisy. The Pawnee spoke an entirely different language from their Siouan neighbors. They were more advanced in the cultural arts and their folklore and music are among the most valuable contributions to American ethnology. The Cheyenne and Arapahoe tribes claimed the hunting grounds in southwestern Nebraska and eastern Colorado. They numbered about 3,000 and their language (Algonquin) indicates their relationship to the New England Indian tribes. The Brule and Oglala Sioux, numbering about 15,000, ranged over western Nebraska from the Black Hills to the Republican. Their language shows their kinship to the Otoe, Omaha and Ponca tribes of eastern Nebraska with whom they were frequently at war. Traditions, folklore and language indicate that the Siouan tribes of Nebraska migrated from the Atlantic seacoast, arriving in the Nebraska region between 1600 and 1700; that the Pawnee came from the south and southwest, reaching Nebraska about the time of Columbus' voyage, and that the Cheyenne and Arapahoe migrated from Canada to the buffalo plains in the 17th century. The total Indian population of Nebraska was about 40,000. The Pawnee, Otoe, Omaha and Ponca

tribes cultivated the soil and made permanent villages of earth lodges, subsisting partly by hunting and partly by agriculture. The Sioux, Cheyenne and Arapahoe tribes lived wholly by the chase and wild fruits; dwelling in skin tents. Warfare between these Nebraska tribes was perpetual, arising chiefly from contests over hunting ground and from love of adventure. The Pawnee, Ponca and Otoe tribes were removed to Oklahoma, the first in 1875, the second in 1877, the third in 1881. The Oglala and Brule Sioux gave up their Nebraska land in 1877 and are now permanently located on reservations in South Dakota. The Cheyenne and Arapahoe Indians are located partly in Oklahoma and partly in Wyoming. At the last census there were 3,784 Indians remaining in Nebraska, all of whom are full citizens of the State. The Omaha tribe numbers 1,276, living in Thurston County. The Winnebago tribe, 1,063 in number, adjoin the Omahas, and were transferred to Nebraska from their old home in Wisconsin and Minnesota. The Santee Sioux number 1,155 and were transferred from Minnesota to Nebraska in 1863. About 290 Poncas returned from Oklahoma and reside at their old home on the Niobrara. The Sauk and Fox Indians occupy a small reservation in southeast Nebraska and northeast Kansas and number about 100.

Exploration.—Francisco Vasquez Coronado with a party of 30 horsemen reached the Nebraska-Kansas region in the summer of 1541 from the valley of the Rio Grande. He probably entered Nebraska although the controversy is unsettled. About the year 1700 French traders came up the Missouri and brought back reports upon the country and the tribes which were fairly accurate. French maps of this period show the various Indian tribes and principal streams. The first definite account of the region is given by the Mallet brothers who named the Platte River and crossed the State from northeast to southwest in 1739. France, Spain and England claimed the region, but the French influence predominated through navigation of the Mississippi and Missouri rivers. In 1762 France ceded the region to Spain. There were Spanish governors at New Orleans and Saint Louis, but the French population and language remained and the early place names in Nebraska are French. The Louisiana Purchase of 1803 brought Nebraska into the American Republic. Explorations under American auspices follow rapidly. The Lewis and Clark expedition in 1804; the Major Long expedition in 1819; the Lieutenant Fremont expeditions of 1842 and 1843, each added to information upon the region. Major Long, who crossed the State from east to west, stated in his report "it is almost wholly unfit for cultivation and of course uninhabitable for people depending upon agriculture for their subsistence," and placed the words "Great Desert" upon the map prepared from his surveys. Before the close of the century practically all the region had been claimed as homes.

The fur traders, the early missionaries and travelers on the Oregon trail furnish the body of Nebraska history until 1854. Manuel Lisa, a Spaniard, was the leading fur trader and ruling spirit of Nebraska from 1807 until his death in 1820. Fort Atkinson, established in

1820 on the Council Bluff, the farthest west United States army post, 16 miles north of Omaha, upon the site of the present village of Fort Calhoun, had a garrison of several hundred men until it was abandoned in 1827. The American Fur Company established regular steamboat navigation of the Missouri in 1832, and among the passengers upon their steamer *Yellowstone* in 1832 was George Catlin, first painter of Nebraska Indians and scenery, and in 1833 Prince Maximilian of Germany who added both paintings and literature upon the region. The Oregon Trail, began in 1830 as a fur-trader's wagon track to the Rocky Mountains, was extended to Oregon by Nathaniel Wyeth in 1832, and by 1842 had become the great transcontinental highway, crossing Nebraska diagonally from southeast to northwest. Other trails, such as the California trail, the Denver trail, starting from different points on the Missouri River, crossed Nebraska, and for 40 years great trains of immigrants, military, freighters and fur traders were the prominent and picturesque features of Nebraska life. The first missionary to the Nebraska Indians was Moses Merrill who came to the Otoe tribe at Bellevue in 1833. In 1834 Samuel Allis and John Dunbar came as missionaries to the Pawnee, and in 1838 Father De Smet reached the Nebraska region as Catholic missionary. The record made by these missionaries and others forms a large part of our knowledge of Nebraska during this period.

Federal legislation made Nebraska from 1 Oct. 1804 to 4 July 1805 a part of the territory of Indiana with its capital at the town of Vincennes. From 4 July 1805 to 7 Dec. 1812 it was part of the territory of Louisiana with its capital at Saint Louis. It then became a part of the territory of Missouri until 1821, when Missouri was made a State and Nebraska cut off and left outside any organized government. On 30 June 1834 Congress established the "Indian Country," of which Nebraska was a part, excluding all white men except military and those having special permission from the government.

The movement to make a Nebraska territory was part of the national movement to colonize and hold the Oregon country. In 1842 Lieut. Fremont mentions the principal river by its Otoe Indian name Nebraska (*Ne-brath-ka*) signifying "shallow water." In 1844 Secretary of War Wilkins suggests that the Platte or Nebraska River would very properly furnish a name to the territory. Stephen A. Douglas introduced the first bill to create Nebraska territory 17 Dec. 1844, followed by other similar bills in 1848 and in 1852. On 30 May 1854 the Nebraska-Kansas bill creating the two territories became a law after a struggle over the exclusion of slavery, which disrupted political parties and churches and prepared the way for the Civil War.

Territorial Period.—The principal events of the territorial period (1854–1867) were the establishment of the capital at Omaha and the resulting bitter feud between the north and south Platte regions; the creation of claim clubs, which undertook to control land settlement regardless of United States laws; the chartering of wild-cat territorial banks with an issue of \$400,000 in paper currency; the growth

of a demand for a free homestead law; the promotion of Pacific Railroad schemes; the organization and growth of the Republican party from 1858 on, and the Sioux-Cheyenne Indian War of 1864.

Statehood.—The first proposal for statehood was defeated 5 March 1860 by a vote of 2,094 for to 2,372 against. On 19 April 1864 Congress passed an enabling act upon petition of the territorial legislature. A constitutional convention, held 4 July 1864, adjourned without action, a majority of the delegates being pledged against statehood. On 2 June 1866 a constitution submitted by the legislature was adopted by the vote of 3,938 to 3,838. At the same election the Republicans elected the State ticket and a majority of both houses of the legislature by nearly the same vote as that cast for the constitution. In this campaign the Democrats, led by J. Sterling Morton, opposed statehood, while the Republicans favored it. The real issue was the fight then on between President Andrew Johnson and Congress, and the question whether two United States senators should be sent from Nebraska to aid Republican leaders in Congress in their controversy with the President. The bill to admit Nebraska under this constitution passed 27 July 1866, but failed to receive President Johnson's signature. In January 1867 Congress again passed an act to admit Nebraska but attached the condition that its legislature should first declare that the provision in the new constitution restricting suffrage to white men should not be enforced. President Johnson vetoed this act. Congress passed the act over his veto. The Nebraska legislature was convened in special session and accepted the condition on 20 February. On 1 March 1867 the President's proclamation admitted Nebraska to the Federal Union.

The capital was removed from Omaha and located 29 July 1867 upon an open prairie with the name of Lincoln. The sale of town lots supplied funds for the erection of a new capitol building. The Union Pacific Railroad was completed to the west line of the State in 1867. A vast tide of immigration set in, largely composed of soldiers from the Civil War. To insure settlement of the prairies where material for building fences was inadequate the legislature in 1870 passed the herd law. In 1871 Gov. David Butler was impeached and removed from office for misuse of public funds. On 4 Jan. 1872, upon motion of J. Sterling Morton, the State Board of Agriculture instituted Arbor Day, since then adopted in many States and countries. Grasshoppers in vast numbers visited the State in 1874–75. The adoption of the new constitution 4 Nov. 1875 marks an important era in the State's development. Wars with the Sioux and Cheyenne Indians along the western border lasted from 1874 to 1877, ending with the surrender of the hostiles and their removal from Nebraska. The third great land-seeking migration began about 1880 and continued for 10 years, taking up the desirable free land to the farthest borders. Conflicts between the "grangers," as the homesteaders were called, and cattle men were a leading feature of this period, resulting in numerous tragedies.

In 1890 and again in 1894 drouth visited the State. The legislatures of 1891 and 1895 appro-

priated \$450,000 to aid settlers. Thousands of homesteads were abandoned and real estate values struck bottom. During this period began the cultivation of sugar beets and the erection of beet sugar factories. Winter wheat and alfalfa became State-wide staple crops. The dairy industry of the State was greatly stimulated and encouraged by the introduction of cream separators on farms and the establishment of centralized creameries. Irrigation and dry land farming became general. The woman's club and the local library systems were established. Social and political ideas were reconstructed. It was a period of revolution. The Kinkaid Homestead Act enacted in 1904 provided 640-acre homesteads for settlers in the sand hills region. Within 10 years about 8,000,000 acres were taken under this Act, practically all of the remaining free government land in the State. About the year 1900 a farmers' co-operative elevator movement began. A vigorous war with the large grain dealers and railroad companies followed. The co-operative movement secured from the legislature of 1905 a law to give them shipping facilities which was affirmed by the Supreme Court. Since then the co-operative movement has steadily grown. About 1913 the farmers' union began a still wider organization for buying and selling co-operatively. This reached a membership of about 35,000 in 1918, carrying on a very large distribution business and promising great changes in the future. In 1912 the State adopted an initiative and referendum amendment to its constitution and in 1916 it adopted a prohibitory amendment by a majority of nearly 30,000. In 1922 the erection of a new Capitol at Lincoln was begun, the appropriation for the building, exclusive of power plant, grounds and furnishings being \$5,000,000.

Nebraska War Activities.—Since the United States entered upon the World War up to 1 July 1919 Nebraska furnished to the army and navy approximately 47,800 men and contributed \$242,000,000 to the five Liberty loans and war charities. Nebraska leads all other States in per capita contribution to war savings stamps and her membership in the American Red Cross is 585,156 or 49 per cent of the population for 1910 census.

ADDISON E. SHELDON,
Secretary of the Nebraska State Historical Society and Director of the Legislative Reference Bureau.

NEBRASKA, University of, The, at Lincoln, Neb., was founded by act of the legislature in 1869. Funds for the erection of the first building were provided by the sale of lots in the then new capital city of Lincoln. This first building, now called University Hall, was completed in 1871, the lumber and part of the brick being hauled from the Missouri River in wagons. The College of Literature, Science and the Arts was opened 6 Sept. 1871, with a faculty of five professors and 90 students. The charter act contemplated six colleges, but an amendment in 1877 reduced the number to five, merging the State Agricultural College and the College of Practical Science into the Industrial College. The board of regents, originally 12 members, but now six, constitute the governing body. The University comprises the Graduate School (degrees, Master of Arts and Doctor of Philosophy); the College of Literature, Science and the Arts (degree, Bachelor of Arts); the Industrial College (degree, Bachelor of Science), which includes the School of Agriculture, the School of Mechanic Arts, and the School of Domestic Science; the College of Law (degree, Bachelor of Laws); the College of Medicine (degree, Doctor of Medicine); the School of Fine Arts; the School of Music; and the summer session. Each college and school has its faculty, charged with the instruction and the immediate management thereof. Law and medicine are not organized into departments. The other colleges are so organized, having the following departments: agriculture; animal husbandry; animal pathology; astronomy and meteorology; bibliography; botany; agricultural chemistry; general chemistry; education (pedagogy); civil engineering; mechanical engineering; electrical engineering; dairy husbandry; domestic science (household arts); mechanical drawing and machine design; elocution; English language; English literature; entomology and ornithology; forestry; geology (including palæontology and geography); Germanic language and literature; Greek language and literature; Roman language and literature; Romance languages; American history and jurisprudence; European history; horticulture; mathematics; military science and tactics; philosophy; physics; physical education; political economy and sociology; zoology. Nebraska students in the College of Literature, Science and the Arts and in the Industrial College pay no tuition. Non-resident students, also all students in the professional schools and in the schools of fine arts and music, pay small tuition fees. All departments are open to both sexes on equal terms. A tax of one mill per dollar on the assessment roll of the State, together with interest income from land sales and land leases are the chief sources of revenue. The University receives the benefit of the Morrill Acts for the maintenance of instruction in branches relating to agriculture and the mechanic arts, and of the Hatch Act, in aid of agricultural experimentation. The 10 buildings on the city campus, with their class rooms, laboratories, libraries and offices, house all the departments except the School of Agriculture, the work of which is done mainly at the university farm, and the College of Medicine, in which the last two years' work is given at Omaha. There are five buildings at the farm. This consists of 320 acres, a little removed

from the city campus. Here are located the departments of agriculture, animal husbandry, animal pathology, dairying and horticulture. About 100 acres are laid out in experiment plats for field crops, fruit and vegetables. Herds of cattle, sheep and swine are owned, being used for experimentation. Four new buildings were recently erected, an administration building and a physics laboratory on the city campus, a hall of agriculture, a dairy building, shops, and a horticulture laboratory at the farm. The library contains about 155,000 volumes. The latest statistics show an enrollment of 5,345 students, exclusive of 2,366 attending the summer session, and 368 professors and instructors. About two-fifths of the students are women.

NEBRASKA CITY, Neb., city, county-seat of Otoe County, on the Missouri River, and on the Missouri Pacific and the Chicago, Burlington and Quincy railroads, about 45 miles in direct line east by south of Lincoln, and 52 miles below Omaha. It is in a fertile agricultural region. It is built on the site of old Fort Kearney (1848) and was laid out in 1855. It was incorporated in 1871 and chartered in 1891. The chief manufacturing establishments are flour and lumber mills, planing mills, a cannery, brick works, press-drill works, cigar, vinegar and pickle factories, windmill works, starch factory, foundries, machine shops and cereal mills. It has large grain elevators, cold storage buildings, lumber yards, stock yards, and packing and provision house. It is the seat of the State Institute for the Blind and the Academy of the Annunciation. It has a public library, a government building, city and county buildings, a number of churches, a high school, and public and parish elementary schools. There is a public monument to J. Sterling Morton, whose home, Silver Lodge, has been handsomely developed and contains a fine arboretum. The government is administered under the commission plan. Pop. (1920) 6,279.

NEBRASKA RIVER. See PLATTE.

NEBRASKA WESLEYAN UNIVERSITY, The, is located at University Place, four miles from the capital city of Nebraska, has its own municipal government, and is connected with the city of Lincoln by lines of electric railway. The University is a denominational institution of the Methodist Episcopal Church, organized in 1887 as the result of an effort to unify the educational interests of the denomination within the State. It consists of a College of Liberal Arts, an academy with courses fitted to the college curriculum, a Teachers' College, a School of Expression and a Conservatory of Music. It is coeducational, and its standards for degrees are those required by the college senate of the denomination for its first class institutions. Its first graduates were the class of 1890, which consisted of four members. Its present number of students is 950; its professors and instructors 46. Its college graduates number about 687; its library has 8,000 volumes; its buildings and grounds are valued at \$225,000; its productive endowment is \$295,000.

NEBUCHADNEZZAR, nēb'ū-kad-nēz'ar (Nabu-Kudurriuzur, "Nebo protect my dominion"), the most illustrious monarch of the New Babylonian or Chaldean kingdom, son of Nabo-

polassar (q.v.). In the lifetime of his father he defeated as crown prince the Egyptian Pharaoh Necho at Carchemish 605 B.C., and ascended the throne as his father's successor 604 B.C. He at once began his career of conquest, subduing Syria, and laying Judah and its king, Jehoiakim, under tribute. In 598 he marched against Jerusalem and led away into captivity at Babylon Jehoiakim, the 18-year-old son of Jehoiakim, just as he had succeeded to the throne on his father's death. With the young king the most eminent rulers of the land were carried off, 10,023 in all, together with the costly spoils of the temple and royal palace. As Zedekiah who succeeded Jehoiakin in the latter's exile entered into a treaty with Egypt Nebuchadnezzar's army besieged and captured Jerusalem a second time, carrying off Zedekiah into captivity (586 B.C.). Nebuchadnezzar meanwhile had strongly established his headquarters at Ribla in Cœlo-Sydia. The remaining inhabitants of Jerusalem were taken as captives to Babylon, and the Jewish capital absolutely destroyed. For the 13 years between 585 and 573 B.C., the city of Tyre was besieged by Nebuchadnezzar to no purpose; in 572 B.C. he invaded Egypt and conquered it from Syene to the frontiers of Ethiopia. Pharaoh Hophra was defeated and dethroned and from 569 to 536 B.C. a Babylonian army occupied Egypt. Besides his activity in these campaigns Nebuchadnezzar was tireless in efforts for the security of his realm, the welfare of his people, the adorning and fortification of his capital Babylon. He restored the ruined canal and cut another, the King's Canal. At Sippara he made a lake like Lake Moeris, 10 miles in circumference, which received and distributed the overflowing waters of the Euphrates, and he founded the city of Terodon at the mouth of that river. He built the Median wall as a defense to his kingdom, and completed the vast ramparts which his father Nabopolassar had begun. He beautified the royal residence with palace and temple buildings, finished the tower of the seven planets at Borsippa, restored and decorated the royal palace of his father, and built a new palace on a height surrounded by hanging gardens for the pleasure of his Median wife, Amytis. This great work is said to have been completed in 15 days. He died after a reign of 43 years, 561 B.C., deeply deplored by his subjects, having been on the whole a great and wise king.

NEBULÆ, The, in astronomy, a term derived from the Latin, signifying little clouds. The nebulae may properly be divided into two distinct classes, the green and the white. The former are frequently very large and irregular in form, sending out sprays and streams in all directions, while the latter have often a spiral structure. The difference between the two classes is fundamental, and it is questionable even if they might not properly be designated by different names. The spectrum of the green nebulae consists chiefly of green and blue lines with sometimes a very faint continuous spectrum,—their constitution is therefore obviously mainly gaseous. The spectrum of the white nebulae is continuous, with, in a few instances, evidence of very faintly marked bright and dark lines. Their nature is, therefore, uncertain, but probably they are made up largely of solid as well as gaseous matter. The green

NEBULÆ

M 77, Ceti
H.I 200, Leonis Minoris

nebulae are distributed in and near the Milky Way; the white ones are located on either side, and are generally remote from it. In this respect they differ from the star clusters, which in other respects they somewhat resemble. While the Milky Way shines chiefly by the light of the countless stars that it contains, a portion of its light is also due to enormous areas of green nebulous matter, which serves as a luminous background to the stars themselves. Undoubtedly the finest telescopic object in the sidereal heavens is the great nebula in Orion, which belongs to this class. It fills a large part of the constellation, and is the largest nebula known outside of the Milky Way. Next to it in size and also in magnificence is 30 Doradus, in the larger Magellanic Cloud. The Argus and Trifid nebulae are other fine specimens of this class. All these nebulae are obviously connected with a large number of stars, and are possibly in process of dispersion from them. Frequently a single star will be connected with a nebular wisp; in the well-known little group of the Pleiades nearly all of the larger stars have such nebulous streamers connected with them and many of the nebulous streamers connect star with star, the whole cluster being apparently full of nebulous matter. Recent observations indicate that this very faint nebulous matter shines principally by the light which it reflects from the brighter stars of the cluster and that it is largely or wholly in an opaque, non-luminous condition.

There is a second division of the green nebulae. These have the same spectrum, but owing to a slightly different division of the light usually present a somewhat bluish appearance. These are known as planetary nebulae on account of their rounded well-defined discs. The discs are generally somewhat diversified and contain sometimes one and sometimes two stellar nuclei. The largest and finest of the planetary nebulae is known as the Owl nebula in Ursa major. It is so called because it formerly somewhat resembled the face of an owl. For a few years it had two brilliant nuclei which corresponded with the two eyes. Later, first one and then the other of these disappeared, and now it has a single nucleus in its exact centre. If the planetary disc is too small to be distinguished as such, the formation is designated as a stellar nebulae. When a *nova* or temporary star fades out, it is usually converted into one of these bodies. If the central portion of a planetary nebula is comparatively dark, it is then called a ring nebula. The best known example of this class is the ring nebula in Lyra. Many of the white nebulae exhibit a spiral structure, and they often are of a double instead of a single spiral structure.

The largest and most brilliant white nebula in the heavens is the great nebula in Andromeda. It is the only nebula indeed that is conspicuous to the naked eye. The one best showing its spiral nature, however, is the Whirlpool nebula in Canes Venatici. Often, as is the case with both of these objects, a secondary nucleus terminates one of the spirals. Smaller nuclei frequently occur at intermediate positions upon both spirals. If the solar system condensed from a former large nebulous mass, it is likely to have been from an object such as one of these, but the solar nebula must have been very much smaller. Unlike the green

nebulae, the white ones are not associated with brilliant stars, but that they are sometimes connected with small ones is shown by the fact that in 1885 a small temporary star suddenly appeared close to the centre of the nucleus of the great nebula in Andromeda; no less than eight new stars have thus appeared within spiral nebulae at various times. It is certain that the association of these stars with the nebulous cloud cannot be accidental. While we have little evidence bearing upon the subject, it seems most likely that the white nebulae are condensing at present upon numerous nuclei located within them. What the size of these nuclei may be we have no knowledge.

A subdivision of the white nebulae consists of small faint elliptical bodies showing no detail. It is possible that if they were nearer to us, and were better seen, that they, too, would show a spiral structure. In closing this brief summary of our knowledge of the nebulae, we must refer to one most unexpected property that some of them have exhibited—that of variability. Three variable nebulae have appeared and disappeared in the constellation Taurus, but the best known example is that of the Trifid nebula, a large section of which, which was formerly dark, is now bright, and apparently a region which was formerly bright is now dark. This is probably due not to a shifting of the material itself, but to a change in its luminosity. The source of this luminosity is unknown, but it may be suggested that the unknown gas which all the green nebulae contain in combination with hydrogen, and which is found nowhere else in the universe, may possess properties like radium, rendering the whole gaseous formation luminous until its original atomic structure is finally broken down. See COSMOGONY.

WILLIAM H. PICKERING,
Astronomical Observatory, Harvard University.

NEBULAR HYPOTHESIS, The. A theory of the method in which the development of the Solar System has taken place from an original nebula. It was first outlined in a somewhat general and indefinite way by Swedenborg and afterward by Kant. It was, however, first presented in detail by La Place and is generally referred to as "La Place's Nebular Hypothesis." See COSMOGONY; GEOLOGY; LAPLACE.

NECESSITARIAN. See DETERMINISM.

NECESSITARIANISM, or NECES-SARIANISM. The doctrine of philosophical necessity which postulates that every event happens according to immutable laws; that freedom of will does not mean freedom from will; the will is free to act according to its own nature, but all actions are related necessarily to hyperphysical causes and natural laws in a universal scheme of predetermined events, outside the range of human knowledge and control. See DETERMINISM; FREE WILL; FREEDOM OF WILL; MECHANISM; MECHANISM AND VITALISM; MECHANISMS, MENTAL; and related references.

NECHES, nĕch'ĕz, a river in Texas, which has its rise in Van Zandt County and flows southeast into Sabine Lake (q.v.). It traverses a fertile agricultural section of the State, and in its lower course passes through an oil region. Beaumont (q.v.) is on its bank a short distance

from the mouth. The Neches is about 350 miles long.

NECHO, nē'kō, or **NEKAU**, Egyptian king, the Pharaoh-Nechoh of the Bible: b. last half of the 7th century B.C.; d. 595 B.C. He was son of Psammetichus I, succeeded him in 609, attempted to hold Syria after the collapse of the Assyrian empire, and in this campaign killed at the battle of Megiddo King Josiah of Judah, whose son Jehoahaz was made king dependent on Necho. He extended the boundaries of his kingdom to the Euphrates, but the later campaign was less fortunate for the Egyptian king, who was defeated at Carchemish in 604 by Nebuchadnezzar, and thus lost possession of Syria. Necho's internal rule was vigorous; he built a canal from the Nile to the Red Sea and sent out Phœnician sailors to explore the African coast. This fleet is said to have circumnavigated the continent. Consult Budge, 'History of Egypt' (1902); Breasted, 'A History of the Ancient Egyptians' (ib. 1908),

NECK, that part of the body in the higher animals which forms the juncture of the head with the trunk. In man the neck is formed mainly of the muscles passing from the skull to the thorax, and of the trachea and the œsophagus. There are also the cervical or neck vertebræ, in man numbering seven, the same number being constant in nearly all the *Mammalia*. The most notable exceptions are seen in the manatees and the two-toed sloth, having six neck-vertebræ; while in the three-toed sloth nine cervical segments exist. In long-necked birds as many as 25 cervical vertebræ may be present. In fishes no neck or cervical region is distinguishable, and structures such as the gill-slits, which belong to the neck region of the mammal, are found in intimate collocation with cephalic organs such as the skull, and thoracic organs such as the heart. A cross-section of the neck at the level of the sixth cervical vertebra shows in front near the middle line the two anterior jugular veins. Behind this come the sternohyoid and sternothyroid muscles, from the breastbone to the hyoid bone and the thyroid cartilage of the larynx, respectively. Just laterally of the sternohyoid the omohyoid runs from the hyoid bone to the shoulder. Still more laterally the sternomastoid, the great cord that shows through the skin of the neck, runs from the breast-bone and collar-bone to the skull behind the ear. In the middle line the trachea or windpipe, the collapsed tube of the œsophagus, and the vertebral column with the spinal cord within it follow one another from front to rear behind the sternothyroid. The space between the trachea and œsophagus, on the one hand, and the sternomastoid and sternothyroid on the other is filled anteriorly by the thyroid gland, posteriorly by a mass of connective tissue containing to the outside the internal jugular vein, to the inside the common carotid artery, and behind the vagus nerve. Between these structures and the spinal column is the longus colli muscle, which helps in bending the neck. The external jugular vein lies just outside of the hind edge of the sternomastoid. Within the foramina in the transverse processes of the vertebræ run the vertebral artery and vein. Behind and to the side of the vertebral column lie the scaleni, the splenii, the complexus, the semispinalis colli, the levator anguli scapulæ,

and the trapezius. The recti are also associated with the vertebral column. The entire front surface of the neck is covered with a thin layer of muscular tissue just underneath the skin, known as the platysma myoides.

Some of the muscles of the neck form triangles with the clavicle, the middle line of the neck, the hyoid and the jaw. These are useful to the surgeon in describing and locating the structures of the neck.

Besides the thyroid gland, the thymus is located in the neck. At the bifurcation of the carotid artery the carotid gland is found. The neck also possesses lymph glands, which are liable to tuberculous infection. In the lower animals especially—as in the horse or elephant—there is a strong band of fibres, forming the ligament nuchæ, which suspends the head on the neck. In man, the head being balanced on the spinal column, this ligament is of comparatively small size, and it extends from the occipital protuberance at the back of the skull to the spine of the seventh or last cervical vertebra. The term neck is also used in anatomy to indicate any attenuated process or part of a bone which serves to unite or support parts of larger proportions; for example, the neck of the femur or thigh-bone, the neck of the humerus, of the radius, etc. See ANATOMY; CAROTID ARTERY; JUGULAR VEIN; LARYNX; THYMUS GLAND; THYROID GLAND; TRACHEA.

NECKAR, nēk'kär, Germany, an affluent of the Rhine, which rises in the Black Forest in Württemberg, near one of the sources of the Danube, and flows through Baden into the Rhine at Mannheim, after a course, including windings, of about 240 miles. The area of its basin is 4,150 square miles. It is navigable for small boats from Heidelberg near its mouth, so far as Cannstadt, but the actual navigation of the river extends only to Heilbronn, up to which steamers ply.

NECKER, nā-kär, Jacques (English, nēk'är), French Minister of Finance: b. Geneva, Switzerland, 30 Sept. 1732; d. Coppet, near Geneva, 9 April 1804. In 1750 he went to Paris to enter the banking-house of his uncle, M. Vernet, and having become partner in a banking business, soon acquired an immense fortune. After giving up his business he held the post of Resident Minister at Paris, representing his native town. Ambitious of literary distinction he produced his 'Eloge de Colbert' (1773), which gained the prize of the French Academy. His 'Essai sur la législation et le commerce des grains' (1775) was violently attacked by the economists, owing to his expressing himself in favor of restrictions on the exportation of corn. In July 1777 he obtained the post of Director-General of Finances. Malversation under the preceding reign had caused a great deficit to which the American war made additions. New taxes would have been unpopular and Necker endeavored to meet the exigency by loans and reforms. The salon of Madame Necker (q.v.) became the centre of the literary and political life of Paris. But the partisans of Turgot found fault with his innovations. In 1781 he published his 'Compte rendu au Roi,' relative to his administration. This statement of the financial condition of the nation found favor with the people, but displeased the court and Necker was dismissed in

May 1781. He went to Switzerland where he published his work 'Administration des finances' (1784). The errors and prodigality of Calonne, who next had the management of the state finances, increased Necker's reputation; the latter returned to France in 1787, wrote against Calonne, who had accused him of being the author of the deficit, and was exiled in consequence. But in 1788 Necker was recalled as comptroller-general, he supported the convocation of the States-General, which was the wish of the nation and the giving a double representation to the *tiers état*. When the court in a royal sitting, held on 23 June 1789, wished to annul the decision of the Third Estate, by which the National Assembly was constituted, Necker refused to appear in the sitting. On 11 July the advisers of the king succeeded in inducing him to give Necker his dismissal and to order him to leave the kingdom. No sooner was his removal known than all Paris was in a ferment. The storming of the Bastille followed (14 July) and symptoms of popular violence became so alarming that the king found himself compelled to recall the banished minister. His first object was to restore tranquillity and security of person and property. But as Minister of Finance he was obliged to propose measures unacceptable to the populace. His moderate opinions in regard to the administration of government did not keep pace with the wishes of those who dictated to the people, notably Mirabeau. Under these circumstances he wrote to the Assembly, in September 1790, requesting his dismissal. His daughter, Madame de Staël (q.v.), has given a somewhat too favorable view of his character as a statesman in her 'Considerations.' His ability, though considerable, was much overrated in his day. Among his other works are 'De l'importance des Opinions Religieuses' (1788); 'Réflexions présentées à la nation française' (1792); 'Du pouvoir exécutif dans les grands états' (1792); 'De la révolution française' (1796); and 'Dernières vues de politique et de finances' (1802). A collective edition of his works was published at Paris in 1820-22 by his grandson, August de Staël Holstein. Consult Nourrisson, 'Trois Révolutionnaires: Turgot, Necker, et Bailly' (2d ed. 1886); Hermann, J., 'Zur Geschichte der Familie Necker' (1886); Gomel, Charles, 'Les causes financières de la révolution française: les ministères de Turgot et de Necker' (Paris 1892).

NECKER, Susanne Curchod de Nasse, French matron: b. Crassier, Switzerland, 1739; d. Coppet, Switzerland, 1794. She came of a French Protestant family and as a girl was noted for her beauty, wit and wide knowledge which so attracted the historian Gibbon that he wished to marry her. In 1764 she married Jacques Necker (q.v.) and in Paris her house soon became frequented by the most distinguished men of the day, among them Buffon, Saint Lambert and Marmontel. She educated her daughter, the famous Madame de Staël in this atmosphere and devoted much time to philanthropic work, founding the hospital named for her. She wrote 'Réflexions sur le Divorce' (1794) and 'Mélanges' (published posthumously in 5 vols.). Consult D'Haussonville, 'Le Salon de Madame Necker' (1882; Eng. trans. by H. M. Trollope, 2 vols., London 1882);

D'Arvor, 'Madame Necker, 1737-94' (Paris 1897); Gambier-Parry, M., 'Madame Necker, Her Family and Her Friends' (Edinburgh 1913).

NECKER DE SAUSSURE, *dé sô-sür*, **Adrienne Albertine**, French writer: b. Geneva, Switzerland, 1765; d. 1841. She was married to Jacques Necker, a cousin of Madame de Staël with whom she was intimate. She published 'Notice of the Character of Madame de Staël' (1820) and 'L'Education progressive ou étude sur le cours de la vie' (2 vols. 1828-32) for which the Academy gave her the Montyon prize in 1832. Part of the work was translated into English (Boston 1835).

NECROMANCER, *The*. See RAMIREZ, IGNACIO.

NECROMANCY (Greek, *nekros*, dead, and *manteia*, divination), the divination of the future by questioning the dead under the belief that the spirits or souls of the dead could be communicated with and could give information regarding the future. This, like many superstitious rites, it is supposed, is of the highest antiquity. Mention is made of necromancy in the Old Testament; for instance, in Deuteronomy (xviii, 11), where it is forbidden. In the 28th chapter of the first book of Samuel the witch of Endor is related to have raised up Samuel to gratify the desire of Saul. In many parts of Greece there were oracles of the dead and necromancy was practised in the temples by priests or other religious persons. It was also practised in Thessaly, notorious for magic and sorcery. From the first the practice was condemned by the Christian Church and during the Middle Ages necromancers were persecuted in all ways, imprisoned, tortured, burned. See MAGIC.

NECRONITE (Greek, "a corpse"), a variety of orthoclase feldspar occurring in granular limestone near Baltimore, Md. It is nearly white in color and derives its name from the fact that it emits a fetid odor when struck.

NECROPOLIS (Greek, "the city of the dead"), a term applied to the cemeteries in the vicinity of ancient cities. In classical antiquity the name is given to a suburb of Alexandria, where the corpses were received and embalmed. Here Cleopatra applied the asp to her breast. Among the famous cemeteries of antiquity are those of Egypt at Ghizeh, the west bank of the Nile at Thebes, Beni Hassan and Abydos, the Etruscan tomb groups of Volci, Tarquinii and Capua, Italy, Petra in Syria. These ancient burial places are of prime importance to the archæologist because of the rich yield of domestic utensils, tools, weapons and jewelry brought to light through the general custom of the ancients in burying such with the deceased.

NECROSIS (Greek, literally, "a state of death"), in *pathology*, the death of a circumscribed piece of tissue. In surgery, the term is specifically applied to the death of a bone, in part or in whole, but especially in mass. The part affected by necrosis, like a slough of the soft tissues, has no longer any organic connection with the body. This dead portion, especially when detached from the bone to which it belonged, is called the sequestrum. If the necrosis is confined to the superficial layers of the bone-substance, the operation of nature by

which the dead layers are thrown off is called exfoliation. The line of demarcation is the boundary between the living tissue and the dead. If it is the whole of the outer case of the bone that suffers, the periosteum or investing membrane sometimes remains healthy and deposits a lymph which rapidly ossifies and surrounds the diseased part with a healthy crust. The bones that most usually suffer from necrosis are those of the lower extremity, the tibia and femur; necrosis of the soft parts is called gangrene (q.v.).

NECTANEBO I, nĕk-tă-nĕ'bō, king of Egypt: d. 364 B.C. The first king of the 30th dynasty he came to the throne in 382, formed an alliance with Evagoras of Cyprus against the Persians; successfully met a Persian invasion in 374; was conservative in religion and restored many old temples. The British Museum possesses his sarcophagus. This great general was succeeded by Teher or Taho, who was supplanted by NECTANEBO II in 361, also a general and also an ally of the Greeks, with whose help he put down a pretender to the throne and for a time held the Persians off, only to succumb to them (343) after the defection of Mentor, one of his Greek generals. He left Egypt and fled to Ethiopia—or by a late and untrustworthy tradition to Macedonia where he seduced Queen Olympias and thus was the father of Alexander the Great. This story is evidently suggested by a longing for poetic justice to the king defeated by the Persians, who in turn were crushed by Alexander. Egypt was a Persian province from 343 to 332, when it came into the control of Macedonia. Consult Wiedemann, 'Geschichte Aegyptens von Prammethich I bis auf Alexander den Grossen' (Leipzig 1880).

NECTAR, a sweet liquid secreted by a glandular surface structure in a plant called a *nectary*; and the name is extended by botanists to any aborted part of a flower in the place between the gynoecium and androecium (see FLOWER) where nectaries usually occur. Nectar varies in composition with the plant that produces it, but consists mainly of water, with sugar and grape-sugar, with traces of other carbo-hydrates and proteids which give it flavor and odor. Nectaries may occur in many places and are of various forms. Those outside of flowers are most often found at or near the base of the petiole or about stipules. Within flowers the nectar glands form a more or less continuous ring between the stamens and pistil; or the disc itself may secrete a sweetish fluid; or other parts, as the petals (for example, in acornite) may become nectaries. In many cases the secretion exudes directly from the surface and not from any definite pore or excretory opening.

Such structures belong mainly to seed-producing plants and serve the purpose of attracting insects whose visits are beneficial in effecting cross-pollination (see FLOWERS AND INSECTS) as they go from flower to flower in search of this delectable food, which bees, wasps and others transform into honey. The nectaries on the outside of certain plants attract ants (q.v.) which protect the plant. The exudation of nectar is dependent on the little understood process of the secretion of sugar by the cells of the nectaries. The water of the nectar is then extracted from these cells by plasmolysis or osmotic action.

The terms nectar and nectary are derived from the name given by the Greek poets to the drink of the immortal gods on Mount Olympus. It was poured out by Hebe, the goddess of Youth, and conferred immortality. Homer describes it as resembling red wine. It was joined with ambrosia, the immortalizing food of the gods, and like it was of most delicious odor.

NECTARINE, a smooth-skinned peach formerly regarded as two distinct species, which may be derived from the seed of a peach or from a peach bud by bud variation, and which, conversely, may produce a tree bearing peaches by either of the means mentioned. In all ways as an orchard fruit the nectarine is managed like the peach, but is far less popular. Commercial orchards of this tree are planted in California, the product being mainly dried or canned. Consult Darwin, 'Animals and Plants under Domestication' (1868).

NECTURUS. See PROTEIDÆ.

NEDJED, nĕd'jĕd, **NEJD**, or **NEJED**, Arabia, the general name signifying "elevated country," applied to the central Wahabi kingdom in great part covered by the heights of Jebel Toweyk. The capital is Riad (pop. 30,000), a centre of Mohammedan orthodoxy and fanaticism. A great part of the region is sandy desert interspersed with fertile spots inhabited by Bedouins. The more elevated districts with towns and villages inhabited by the settled population, feed immense droves of camels and the best breeds of Arab horses. The climate is healthful. Politically it is a dependency of Jebel Shammar. The inhabitants are Wahabis, est. at 1,000,000. Consult Palgrave, 'Central and Eastern Arabia' (1865).

NEEDHAM, nĕd'am, **Charles Willis**, American college president: b. Castile, N. Y., 30 Sept. 1848. He was graduated from the Albany Law School and in 1874-90 practised law in Chicago where he assisted in founding the University of Chicago. In 1890 he removed to Washington where he established a law practice and in 1897 began his connection with Columbian University (now George Washington) of which he became president in 1902. He resigned this position in 1910, when he became counsel for the Interstate Commerce Commission. He is also professor of constitutional and interstate commerce law in the Washington College of Law and is the author of several pamphlets on education, law and jurisprudence and is a contributor to periodicals.

NEEDHAM, **James George**, American naturalist: b. Virginia, Ill., 18 March 1868. He was graduated in 1891 from Knox College, Galesburg, Ill., and studied later at Johns Hopkins and Cornell. He was professor of biology at Lake Forest University from 1898 to 1906, and had charge of the New York Entomological Field Station after its establishment in 1899. He was called to Cornell in 1906 to initiate a new line of university studies in limnology and has been since 1914 professor of entomology and limnology in Cornell University. He has written 'Elementary Lessons in Zoology' (1895); 'Outdoor Studies' (1898); 'General Biology' (1909); 'The Natural History of the Farm' (1913); 'The Life of Inland Waters,' with J. T. Lloyd (1915).

NEEDHAM, John Turberville, English naturalist: b. London, England, 10 Sept. 1713; d. Brussels, Belgium, 30 Dec. 1781. He was a Roman Catholic priest and was in his later years director of the Academy of Sciences at Brussels. He published 'New Microscopical Discoveries' (1745); 'Idée sommaire, ou vue générale du système physique et métaphysique sur la génération' (1780).

NEEDLE, a small instrument of steel pointed at one end and usually with an eye or hole at one end through which a thread is passed in sewing and stitching. The needle was known in very ancient times, its invention being ascribed by the ancients to the goddess, Bellona. The earliest instruments of this kind were fashioned of wood or fish-bones and did not have the eye, but were used after the manner of an awl. The skill in embroidery possessed by early peoples such as the Babylonians, Phrygians and Egyptians attest their acquaintance with a needle of a highly-developed type. In Pompeii both ordinary and surgeon's needles have been found. The Chinese appear to have been the inventors of steel needles, which spread later throughout the Moslem world and reached Europe through the Moors. Nuremberg was the earliest seat of the needle-making industry in Europe, needle-makers being incorporated there as early as 1370. It was not until 1560 under Elizabeth that the manufacture of needles assumed any importance in England, and not until a century had passed did this industry reach important proportions. Toward the close of the 18th century mechanical processes had been perfected for producing a steel rod of the length of two needles, which were subsequently cut and drilled by hand. In 1826 for the first time a stamping machine was used to drill the eyes but it was not until the 80's of the last century that machinery had displaced all the old hand processes. At the present time the processes in manufacturing needles is in excess of 20. First comes the selection and gauging of the wire which is now coiled by winding it in a circle of 16 feet circumference. The coil is cut into exact halves by means of powerful shears. The next process is the cutting of the half-coils into two needle lengths. The wires, now of two-needle lengths and still somewhat curved, are now heated to a dull red and placed in bundles inside iron rings and are straightened by being rolled to and fro on a plate with a curved bar. They are next pointed at both ends, being advanced to the grindstone from a hopper on a pulley, the blanks are held to the face of the grindstone by a rubber-band arrangement. A current of air is employed to draw off the fine steel dust, which is highly injurious to the operators. The blanks are now fed to a machine which forms the flats for the eyes, which are now driven through by a punching machine. The double needles are next placed on two wires, are broken apart between the heads, other processes being used to remove the burr of the stamping and in general to grind the heads to the required shape, polish and temper the needles. Hardening is performed by dipping in cold oil after the needles have been raised to a red heat; the process of tempering is continued by moving the needles on a belt of wire gauze, traveling over gas flames. The needles are next rolled

under the finger on a smooth stone, and bent ones are removed. After being made into large parcels they are washed in order to remove all oil or emery powder still adhering to them. Fine quality needles have the eyes gilt. The eyes are polished with fine emery and flax thread. The whole needle is polished by being passed between leather-covered rollers, with retaining-rollers above them. Another machine next lays the needles with their heads in one direction. Gauges are used for sorting the needles according to length. Lastly, they are put up in small packets in a machine of the folding or envelope-making type.

In addition to the ordinary needle, special kinds are designed for sewing canvas, leather, upholstery, surgical operations, etc., and for sewing machines. Crochet needles have a hook at one end. Other hooked needles are used for hosiery and stockinet work. Sewing machine needles have a hook, eye or barb at the pointed end. A wax-thread needle of varying shape according to the nature of the work is used for leather. Some have hooks which pull the thread through a hole pierced with an awl. A welting-machine needle is a section of a circle in shape.

In the United States the manufacture of needles is a minor industry. The total value of products reported by the industrial census of 1914 was \$2,556,888. If the quantity made in connection with other industries could be definitely ascertained, it is likely that the total annual manufactures of needles would reach \$3,000,000 in value. In the same year the value of hand-sewing, darning and shoe-machine needles imported into the United States reached \$481,631. Consult the *American Machinist* (Vol. XXX, New York 1907).

NEEDLE GUN, a primitive breech-loading bolt-action rifle, used by the Prussians in 1866 and by the Germans in the Franco-Prussian War. It was invented from 1824 to 1836 by one Von Dreyse, raised to the nobility in 1864. In 1841 it was first adopted by the Prussians. The firing-pin had to penetrate the powder-charge of the paper cartridge before it could reach the detonator at the base of the bullet. The range of the gun was short, even compared to contemporary muzzle-loaders, and especially as compared to the chassepot of the French. Much gas escaped at the breech. The needle gun was superseded by the Mauser. The calibre of the needle-gun was .607 inch, its weight without the bayonet 10 pounds and 4 ounces. With a charge of 75.15 grains of black powder, it propelled a 478 grain lead bullet at a muzzle velocity of 1,000 feet per second. It was sighted to 800 paces, or about 656 yards.

NEEDLE-ORE, the common name for aikinite also called aciculite and acicular bismuth. It is a sulphid of bismuth, lead and copper, of formula $3\text{Pb}(\text{u}_2)\text{S.BiS}_3$, and is found native in connection with gold in various localities. It has a dull metallic lustre and is of a blackish lead-gray color. Its hardness is 2.5, its specific gravity is 6.7-6.8. It occurs in embedded acicular crystals of needle-like formation and hence derives its name.

NEEDLEFISH, a marine gar of the genus *Tylosurus* (see GAR), especially *T. acus*.

NEEDLES, The, a group of small but very prominent peaks in the southwestern part of Mohave County, Ariz., which are conspicuous from the Santa Fé Railroad. They are near the bank of the Colorado River and are about 1,100 feet above the stream. They consist of volcanic rock.

NEEFS, nâfs, more correctly, **NEEFS**, **Pieter, THE ELDER**, Dutch painter: b. Antwerp, about 1578; d. there, between 1656 and 1661. He was a pupil of the painter of architectural views, Hendrik van Steenwijck (q.v.), began his career as a painter in the same department of art in 1605, and in 1609 was elected a member of Saint Luke's Guild of painters in Antwerp. His paintings are numerous, and he is well represented in the Louvre at Paris, the Pinakothek at Munich, the Museum at Ghent, the Gallery at Dresden and other European collections. They are mainly interiors of churches, the gloom of the building being lit up with torches or tapers and are remarkable for aerial and linear perspective. The technique is delicate and highly finished. He generally secured the services of some other artist to introduce figures in his views, among others Teniers, Francken and Van Thulden.

NEENAH, ne'na, Wis., city in Winnebago County; on Lake Winnebago at its outlet, and on the Fox River; also on Chicago and Northwestern, Minneapolis, Saint Paul and Sault Sainte Marie, and Chicago, Milwaukee and Saint Paul railroads; about 90 miles north by west from Milwaukee and 13 miles north of Oshkosh, the county seat. It is partly on Doty Island, through the centre of which an imaginary line separates it from its twin city, Menasha, the two cities being one in commercial interests but each having an independent municipal government. Neenah was settled in 1843 and in 1850 incorporated as a village, and as a city in 1873. Fine water power is obtained from the Fox River. It is the centre of the paper manufacturing industry in Wisconsin and in addition has large plants manufacturing doors and other interior finish, shoes, knit goods, stoves, municipal castings, paper-mill rolls, castings and other requisites, cellulose, fibre rugs, bags, flour, cotton waste, ruled and blank books, etc. It is the centre of a great dairying district and its exports of cheese run into millions of dollars yearly. It contains the home offices of the Equitable Fraternal Union, Wisconsin's largest fraternal insurance society, and of the Jewelers' Fire Insurance Company, both doing business in practically every State in the Union. The city is most attractive for tourists, the hotels being among the best and most beautiful in the northwest. Fine public buildings, parks, churches, theatre, armory, splendid library, Kimberly High School and Theda Clark Memorial Hospital, two electric interurban lines, three banks, with resources over \$3,000,000, two daily newspapers, well-paved streets and municipal water system stamp it as one of Wisconsin's most progressive cities. Pop. (1920) 7,171.

NEER, nâr, **Aart van der**, Dutch painter: b. Amsterdam, 1603; d. there, 9 Nov. 1677. He became famous in his native city about 1640. He excelled particularly in moonlight effects among the casual scenery of Holland, as well

as in winter landscapes, skaters on the ice, fires or conflagrations. These midnight scenes of raging flame are sometimes filled with figures, which give them a powerful dramatic effect. His pictures are found in the galleries at Dresden, Brussels, London, New York, the Schwerin Gallery, the Berlin Museum and in the museums of Amsterdam and Brunswick and the collection of Lady Wäntage. He ended his days as an innkeeper.

NEERWINDEN, nâr'vîn-dên, Belgium, a village in the province of Liège, 16 miles from Louvain, which gives its name to two battles fought in the vicinity: (1) on 29 July 1693 when the French under the Marshal of Luxembourg gained a victory over the English and Dutch allies under William III of Britain; (2) on 18 Mar. 1793 when the French under Dumouriez were defeated by the Austrians under the Prince of Coburg. It was occupied by the Germans in the European War in 1914.

NEES VON ESENBECK, nâs fôn ä'zën-bek, **Christian Gottfried**, German botanist and natural philosopher: b. in the Odenwald, 14 Feb. 1776; d. Breslau, 16 Mar. 1858. He was long a practising physician, but became professor of botany successively at Erlangen (1818), Bonn, (1819), Breslau (1831), and Berlin (1848-52). He displayed much originality of thought in his 'Naturphilosophie' (1841), forming Vol. I of his uncompleted 'System der spekulativen Philosophie.' Among his other writings are 'Handbuch der Botanik' (1820-21); 'Bryologia Germanica' (1823-31). His specialty was cryptogamous plants on which his chief work is 'Naturgeschichte der europäischen Lebermoose' (1833-38).

NEF, **John Ulric**, American chemist: b. Herisau, Switzerland, 14 June 1862; d. 1915. He was graduated from Harvard University in 1884 and at Munich. In 1887-89 he was professor of chemistry in Purdue University, Lafayette, Ind., and in 1889-92 he was engaged at Clark University, South Atlanta, Ga. He became professor of chemistry in the University of Chicago in 1892 and since 1896 was head professor of that department. His scientific papers were published in the *Annalen der Chemie*.

NEGAPATAM, nêg-a-pa-tâm', India, a town and port of the Tanjore district, Madras. It has an active trade in rice, tobacco, cigars, hides, cotton goods, betel nuts and camphor with Ceylon, the Straits Settlements and Burma, and is the terminus of the South Indian Railway. It was an early settlement of the Portuguese; was taken by the Dutch in 1660, and by the British in 1781. Pop. about 70,000.

NEGATIVE QUANTITY. See MATHEMATICS.

NEGATIVES, Development and Treatment of. The development of a negative must be considered as beginning with the exposure of the plate in the camera (see PHOTOGRAPHY), for the change in the sensitive silver salts on the negative plate is begun by the action of the light which reaches them during exposure. With an insufficient exposure the negative cannot be developed. A nearly sufficient exposure can be "tinkered" into something of a negative from which unsatisfactory prints may be made, and in some cases these are the best which may be had under existing conditions. An over-ex-

posure can nearly always be saved and made to produce acceptable positives. The principles of development of both glass dry-plate and film photographic negatives are the same. They are usually developed in a photographic dark-room or in special small portable dark-rooms or in developing machines. Photographic dry plates have spread upon the surface a coating of a gelatine emulsion containing a certain amount of bromide of silver. The emulsion is flowed over the plate surface in a warm fluid condition, which solidifies when cooled. Sensitized photographic films are prepared by spreading the emulsion upon a transparent support resembling celluloid. When the prepared glass plate or film is exposed in the camera, the light acts upon the gelatino-bromide of silver in such a way, it is believed, as to convert the bromide of silver in the film into a sub-bromide which becomes thereafter susceptible to the action of a reducing agent known as the developer, in proportion to the amount of light to which it was subjected. The bromide of silver not acted upon by the light is not affected chemically by the developer. The chemical change which the developer induces in the sub-bromide of silver is a reduction of the light-affected parts to metallic silver. Any substance which will effect this reduction is known as a developing agent. There are new ones being added continually to the list. Most developers are derivatives of coal tar, the more common ones being pyrogallol, known as "pyro," quinol, amidol, metol, ortol, adurol, glycin and eikonogen. While a solution of any of the developing agents alone would in time reduce the exposed silver bromide to metallic silver, in practice it is found best to combine the developing agent with an alkali, carbonate of soda, ammonia or carbonate of potash to hasten the action. The alkali is called the accelerator. To prevent a too rapid oxidization of the developer, sodium sulphite is added and preserves the developer solution prior to the mixture with it of an alkali. For this purpose with certain developers oxalic acid, as well as other acids of a similar character like sulphuric or sulphurous acids are added, which will keep the solution from oxidizing, evidenced by its discoloration. There are many different developing agents and many different formulæ for making developing solutions. These differ but slightly from each other in their action; the general method of use is the same. In compounding developers it is sometimes advisable to introduce a very small proportion of potassium bromide, or ammonium bromide, particularly in the development of plates known to be or suspected of being over-exposed. They are known as restrainers and have the power of retarding the action of the developer on the parts which received the least light, which is sometimes desirable. Instead of dissolving the bromide of potassium or ammonia in the developer, it is usual to prepare a weak solution of bromide in water, about five grains to five or eight ounces of water, and immerse the plate in this solution for three or four minutes before developing, then remove and transfer the plate to the developing tray and pour upon it the normal developer. The preliminary bromide treatment checks the rapidity of development in the shadows and lower tones and helps to prevent an over-exposed plate from becoming flat or foggy.

In general to obtain the proper density in the film for most commercial plates, it has been found that four grains of pyrogallol acid, metol, ortol, glycin, pyro-catechin, adurol, eikonogen, diogen, imogen, edinol and other similar developer agents, to the ounce of water, is about the right proportion. Bromide of potassium aids in increasing the density. In some cases where it is desired to secure thin quick-printing negatives full of detail the normal percentage of the developing agent to the alkali can be reduced one-fourth.

The method of developing plates or cut films in a dark-room is as follows:

The exposed plate or film must be removed from the holder in a dark room or a room illuminated only by a deep ruby-red colored light. The plate or film is then placed in a tray and the developing solution, previously prepared, poured over it in a smooth even flow. Perhaps an easier way to secure the even covering with no dry spots is to tilt the tray till the developer is in one end, lay the plate into the tray touching the empty end first, and as the other end falls into the developer tip the tray in the other direction, flowing the developer with one progressive sweep over the plate. The developer at once begins its action although it is not immediately visible and should be kept in motion by rocking the tray. In about a minute after immersion parts of the plate are seen to grow dark where the developer is changing to metallic silver the light-affected silver sub-bromide, the parts receiving the strongest light, such as the sky, being the first to turn dark. The operator watches the progress of the change by holding his plate up to the colored light from time to time.

In about four or five minutes, with a proper exposure and normal developer, all the susceptible silver bromide has become metallic silver, forming the negative image of the object photographed. The silver is densest where the light has acted most vigorously on the sensitive film; thinnest where there was the least light as in the shadows. When the image is fully developed so that no further details are desired in the shadows, the plate or film is well rinsed in water to remove the developer, and is ready for the second chemical step, called "fixing." In developing roll film the roll is unwound from the spool and the ends detached from the black paper backing. Holding the film by the two ends, it is first run back and forth from end to end through a deep tray of water two or three times and then through the tray of developer, back and forth, until finished.

The chemical commonly used for the fixing process is hyposulphite of soda—"hypo" in the photographic vernacular. To prepare the fixing solution, about one ounce of "hypo" is dissolved in six ounces of water and the solution is poured into a separate tray used solely for this fixing bath, and in this the negative is immersed. The action of the solution on the negative is to dissolve away the unreduced silver in the plate or film, a process requiring about five minutes. As the action of the fixer proceeds, the milky appearance of plate or film is seen gradually to fade out. When all the soluble silver has been removed—indicated by the total disappearance of the whitish color—the negative is chemically complete and may be

exposed to light without injury. But it should be returned to the hypo for five minutes longer, as some invisible salts of silver require to be removed. The negative should now be removed from the "hypo," rinsed in clear water and placed in a bath of alum and water for a few minutes. Instead of alum a formaline solution may be used. These solutions toughen the gelatine so that it will not be readily marred or scratched in subsequent handling. The negative should then be washed thoroughly in running water for about an hour to eliminate all the hypo and alum. The washing process may be more effectively carried out by changing the water 10 times at intervals of five minutes. If cold washing water can be had the first five changes should be made before the film is hardened in the alum bath. If a glass negative, it may be immediately placed in a rack to dry and the drying hastened by placing the rack in a window or in front of an electric fan, every possible care being taken to prevent dust from settling on the wet negative. In the case of film negatives, a short soaking in a glycerine solution is advisable. This is to prevent the contraction of the gelatine side of the film, in drying, from curling the film. After removal from the glycerine solution, the negative is dried without washing. With the "non-curling" (N-C) films the objectionable glycerine bath is unnecessary. Drying requires a number of hours under ordinary conditions.

Glass plate negatives are developed one at a time for the best results. Where time presses and fair results will answer, as many as will cover the bottom may be placed in the developing tray at once. Film may be developed in the entire strip of 2, 4, 6, 10 or 12 negatives, as the film cartridges are prepared; or they may be cut apart and each exposure handled separately. The cutting apart may be done at any time after development has proceeded sufficiently to show the dividing line between the exposures on the film strip. The temperature of both developing and fixing solutions should be between 60 and 70° F., as should the alum hardening bath. If the temperature of the solutions is materially higher, the gelatine emulsion softens unduly and may be lost. If the solutions are below 60°, development is retarded. In the case of over-exposure, whether accidental or intentional the development should be checked when the shadows begin to darken. That is the condition of highest contrast of dark and light obtainable with that exposure. If the negative is then too thin for a good print, a mild intensification will produce a very fine negative, particularly for making lantern slides.

Sometimes after development, negatives are found to be too "dense" to give good results in printing—that is, the metallic silver has formed too thick over the whole negative, or parts of it. This may be due to several causes, chiefly to too great a proportion of alkali in the developer, or too high a temperature. It may also occur with too concentrated a developer. "Dense" negatives may be improved by what is called reducing. This is done by immersing the negative, previously washed with care, in a weak bath of ferri-cyanide of potassium, a small amount of hyposulphite of soda and water. This solution gradually dissolves

away the reduced metallic silver of the negative image. When enough has been removed to make the negative of proper density, the reduction is checked by washing, and the negative is dried in the usual way. Negatives may be reduced locally by applying the solution to the parts with a small brush. In place of ferri-cyanide of potassium, persulphate of ammonia without hypo can be used. The formula is as follows:

Persulphate of ammonia.....	30 grains
Water.....	4 ounces

Make a fresh solution each time and add two drops of nitric acid. The salt readily dissolves. The negative if dry should be first soaked for half an hour in water and then be immersed in half the ammonia solution. Reduction proceeds gradually. If the reduction is not complete in four minutes throw away the solution, and pour on the other half of the fresh persulphate solution. When the reduction is sufficient, wash the negative under the tap and immerse for 10 minutes in a 10 per cent solution of sodium sulphite to check the action of the persulphate; then wash and dry. This reducer is particularly useful for hard contrasty flash light negatives as it works strongest on the high lights while preserving the details in the shadows.

Negatives are sometimes underdeveloped, owing to a very short exposure. In case the image has not impressed itself upon the plate it cannot be developed far enough to give good prints, not enough metallic silver having been formed. Such negatives may be "intensified," which is a sort of redevelopment. A negative must be well washed to eliminate the hypo prior to the intensification process. There are different ways of accomplishing this with a variety of formulæ. A common way is to immerse the negative in a solution containing bichloride of mercury. This changes the dark negative image to a white color, the metallic silver in the film having been reduced to silver chloride by association with the mercuric chloride. The whitened or bleached negative is now transformed, after being well washed with water, by immersing in a bath of water and dilute ammonia or a solution of sodium sulphite and water, until the white color becomes brown or black. The action of the alkali changes the chloride to metallic silver again with the addition of mercuric deposits. The negative now possesses greater opacity in the high lights and will yield more vigorous prints. But no process will bring out the wealth of detail secured only by a sufficiently long exposure, and while an underdeveloped plate may be improved by intensification it cannot be made a truly satisfactory negative. The intensifying process may be repeated by washing the film carefully after each step. Repeating the process causes the deposit to become browner and thus more resistant to the passage of actinic light in printing. Another and much more important use of the intensifying process is in the thickening of the very thin image on overexposed plates. In such cases the development would have to be cut short to avoid fogging, and the image, while full of detail, would not have printing density. Judicious intensifying will in such circumstances produce a perfect negative. Negatives may be intensified locally by applying the chemi-

cal solutions to the desired parts with a camel's hair brush after soaking the negative in water.

How far to carry the development of glass plates or film is an important point in negative making. Some operators rely entirely on their judgment in the case of each negative, examining it by the dark-room light to see when the desired density has been attained. The uncertainty of results in thus trying to stop development at just the right point resulted in the introduction of what is known as the "factorial system" of development. This system is based on the theory that a certain definite relation exists between the total length of time required for development, and the time elapsing between immersing the plate in the developer and the first appearance of the image. Different developers have different factors according to their various actions. So, multiplying the time elapsing from immersion in developer to appearance of image, by the factor of the developer used, gives total length of development needed. In these calculations the temperature of the developer is a most important factor, also. The factor of any developer at a definite uniform temperature can be determined by experiments.

Underlying this "factorial system" is the theory that in every case the time of exposure of plate or film alone determines the final quality of the negative. The eminent authorities, Alfred Watkins and Hurter and Driffield, hold this view, which is being generally accepted. The graduation between light and shadow in the negative (not its general "density" or "thinness") really determines its printing quality; what this scale of graduation or ratio of contrast is going to be eventually is fixed before the image makes its appearance in the developer. But, if the operator knows before development of over or under exposure, he may influence the contrast in his negative somewhat by altering his developer. In view of the above, time development is now recognized by many workers as the correct way of development, the length of time to elapse between the immersion of plate or film into the developer to the completion of development varying with solutions of different compositions and their temperatures.

The Kodak developing machine, made for film only, is based on the principles of time development. With it film is developed without a dark room. Introduced in 1901, the Kodak developing machine became immediately popular with film workers and has become the favorite method of development. The advantages of machine development are many. No dark room is needed; the operations are simpler and therefore more likely to be successful. The general results are better than by the older development method. With the Kodak developing machine the operator of course does not have to depend upon his own judgment as to when development should cease. He times development, thus being certain of his results, assuming the exposure to have been correctly timed. The chemicals to be used with the machine are prepared in powder form, needing only to be combined with water to form the proper solutions. The chemical principles of development in the Kodak developing machine and in the dark room are identical. The ma-

chine itself is a light-tight metal box containing a colored transparent apron. Its operation is as follows:

Kodak Developing Machine.

The spool of film is inserted in the machine so that the black paper, which protects the roll of film from light in the cartridge, will lead from the top, as shown in cut, the transparent apron (F) having first been wound onto arbor "A." The black paper is then pulled out and the end attached to arbor "B" by slipping under the wire guard. Arbor "B" is then turned to the right until the word "stop" printed on the black paper to mark the beginning of the film strip appears. The developer is then poured into compartment "E," the end of apron (F) is hooked onto arbor "B" and the top put on the machine. The operator then turns handle to the right until the time of development (four or five minutes) has expired. The film "G" winds up inside of apron, but with the face not touching it, thus allowing free action of the developer. The cover is then removed from machine, developer poured off and fixing solution poured in; the cover replaced and the handle turned again for about five minutes, when the fixing is complete. After fixing, the film is removed from machine by taking hold of either end of black paper and pulling out of machine, the film being taken hold of when it appears and pulled free from the black paper. Nothing remains to be done except to wash the film, harden it in the alum solution and pin up to dry. Film must always be developed in the entire strip when using the machine. For those who mix their own developer the following formula will be found reliable:

TANK DEVELOPER.

Water.....	4 ounces
Sulphite of soda.....	300 grains
Potassium bromide.....	15 "
Adurol.....	105 "
Metol.....	15 "
Potassium carbonate.....	750 "

This is the stock solution. For developing, 1 ounce of this is diluted with 16 ounces of water. It develops the film in 25 minutes at a temperature of 65°.

GENERAL FORMULÆ.

PYRO DEVELOPER.

1.	
Pyrogallie acid.....	$\frac{1}{2}$ ounce
Sulphuric acid.....	20 minims
Pure water.....	32 ounces
2.	
Sulphite of soda (anhydrous).....	3 ounces
Carbonate of soda.....	2 "
Pure water.....	32 "

To develop take

Water.....	2 ounces
No. 1.....	1 ounce
No. 2.....	1 "

EIKONOGEN DEVELOPER.

1.	
Eikonogen.....	1 ounce
Sulphite of soda (crystals).....	3 ounces
Water.....	60 "
2.	
Carbonate of potash.....	3 ounces
Water.....	30 "
To develop take	
No. 1.....	2 ounces
No. 2.....	1 ounce
Water.....	2 ounces

METOL DEVELOPER.

A.	
Distilled or boiled water.....	10 ounces
Anhydrous sodium sulphite.....	250 grains
Metol.....	50 "
B.	
Distilled or boiled water.....	10 ounces
Potassium carbonate C. P.....	1 ounce

For normal developer take 3 parts of A and add 1 part of B.

For over-exposure take 3 parts of A, add $\frac{1}{2}$ part of B, 4 parts of water and 10 to 16 minims of a solution of potassium bromide, 1 to 10.

Carbonate of soda can be substituted for carbonate of potash.

METOL-QUINOL DEVELOPER.

Make two solutions as follows, each will keep a long time:

1.	
Metol.....	50 grains
Hydroquinone.....	40 "
Potassium metabisulphite.....	$\frac{1}{2}$ ounce
Distilled water.....	10 ounces
2.	
Sodium carbonate (crystals).....	2 ounces
Distilled water.....	10 "

For use mix equal parts. Bromide of potassium should be added in very small quantities in cases of great over-exposure.

EDINOL DEVELOPER.

Edinol.....	240 grains
Potassium metabisulphite.....	120 "
Sodium carbonate.....	800 "
Sodium sulphite.....	400 "
Potassium bromide.....	40 "
Water.....	10 ounces

This is a one-solution developer. For use 1 part of above is put into 7 parts of water. Can be used for several negatives. Is of a light straw color.

HYDROQUINONE DEVELOPER.

For those who have no conveniences for weighing and compounding formulas, a developer which will always give excellent results with almost all dry plates and films on the market may be made by taking two packages of the Eastman hydroquinone developing powders, mixing both sections of the hydroquinone in 8 to 10 ounces of water and adding only one section of the alkali powder. At a temperature of 70° F. this developer gives strong, virile negatives with fine clean shadows and abundant detail.

FIXING SOLUTION.

Hyposulphite soda.....	4 ounces
Water.....	16 "

ALUM BATH.

Saturated solution of alum allowed to settle and decant.

ACID FIXING BATH.

Into an 84-ounce bottle or jar put 56 ounces of warm water, 1 dram of sulphuric acid and 2 ounces of sulphite of soda crystals. When these are dissolved add 16 ounces of hyposulphite of soda. When entirely dissolved add a previously prepared solution of 1 ounce of chrome alum in 8 ounces of water. This keeps a long time and may be used over and over till exhausted.

TO MAKE FARMER'S REDUCER.

Dissolve 1 ounce ferri-cyanide of potassium in 9 ounces water, forming a 10 per cent solution. Add enough of this solution to fresh hypo bath to make it a light straw color. This acts very rapidly and must be used with great care. It reduces all parts of the plate alike, thus differing from the persulphate of ammonia reducer.

INTENSIFIER.

1.	
Mercuric chloride.....	1 dram
Ammonium chloride.....	1 dram
Water.....	4 ounces
2.	
Ammonia (.880).....	1 dram
Water.....	4 ounces
Bleach in No. 1, wash well, and blacken in No. 2.	

A milder but in many respects better intensifier is made by dissolving 4 ounces sodium sulphite in 20 ounces of water and adding 90 grains of the red iodide of mercury. The negative builds up steadily and is to be washed when done and dried. It may afterward turn whitish or yellow, but this will not injure its printing qualities.

Editorial Staff of The Americana.

NEGAUNEE, nĕ-gâ'nĕ, Mich., city in Marquette County, on the Duluth, South Shore and Atlantic, the Lake Superior and Ishpeming and the Chicago and Northwestern railroads, about 12 miles west by south of Marquette. It was settled in 1846 and in 1873 was chartered as a city. It is in the iron region of the State and has within the city limits several productive iron ore mines. The ridge (Iron Mountain) upon which Negaunee is located is over 1,000 feet above Lake Superior. The chief industries of the city are connected with the mining and shipping of iron ore. It has excellent public and parish schools. The city owns and operates the electric-light plant and the water-works. Pop. (1920) 7,419.

NEGLEY, nĕg'li, James Scott, American soldier: b. Liberty, Pa., 22 Dec. 1826; d. Plainfield, N. J., 8 Aug. 1901. He was educated at the Western University of Pennsylvania and served in the ranks through the Mexican War. At the outbreak of the Civil War he organized a brigade, was commissioned brigadier-general and joined the Army of the Ohio. He defeated the Confederates at Lavergne in 1862 and was

promoted to the rank of major-general for gallant conduct at Stone River. Commercial and railway enterprises engaged his attention after the war and in 1869-73, 1875-77 and 1885-87 he was a member of Congress.

NEGLIGENCE, in law, is the failure to do something which a prudent and reasonable man would do under similar conditions, or the doing of something which such a man would not do. This involves in either case a violation of a legal duty, and a resultant damage to the person to whom that duty was owed. Moreover, the person charged with negligence must have been under an obligation to exercise care or diligence either assumed by contract or imposed by law. The third element of negligence is the legal damage to the one toward whom the person charged is bound to exercise care or diligence. Three degrees of negligence are recognized in law: *Ordinary*, the want of ordinary care or diligence; *slight*, the want of great care or diligence, and *gross*, the want of slight care or diligence. The standard of care or diligence required in a given case is usually a question of fact to be determined by a jury. When the evidence of the parties to a suit is not conflicting the court decides the question of the negligence of the defendant. In such cases it often happens that the plaintiff is nonsuited because according to his own statement the injury for which he seeks legal redress was not caused by a negligent act or omission on the part of the defendant. In most jurisdictions, however, the jury, after instruction by the court in the law governing the case, determine whether the defendant exercised the care or diligence requisite in his case.

Negligence is not presumed by the law on the part of any one, hence the burden of proving the fact rests with the plaintiff, except when the thing resulting from the negligence speaks for itself. An awning-frame falls from a window, injuring the plaintiff; in this case we have a situation which would not exist had the owner of the building taken even ordinary precautions for the safety of pedestrians. The presumption of proper diligence in his case is overcome and the plaintiff will recover damages unless the defendant can show that, despite this circumstance, he was without fault. A general rule may here be stated: A person undertaking the performance of a special task requiring special knowledge or skill is liable if he fails to do all that a person equipped with such special knowledge could reasonably be expected to do in the case, due consideration being given to all the circumstances. If an automobile repairman undertake to put a motor in good running order he binds himself to do so with the care of the average motor repairman. It is also held generally that the amount of care may vary with the apparent risk. For example, a man sets about burning brush or weeds upon his land and the fire, getting beyond control, spreads to his neighbor's property. In passing upon his act the circumstances of the dryness or dampness of the brush or weeds, the direction of the wind and the efforts, if any, made by him to confine the conflagration to his own property must be taken into account.

The duty of taking proper care or diligence is always relative, never absolute. Consequently negligence cannot exist where there is no duty to exercise care. An example of this

may here be stated: A man sets out poisoned meat on his lands in an effort to destroy marauding animals, such as coyotes, which are worrying his sheep, his neighbor's hogs break into his land and one or more of them eat the poison and die. This man was not negligent in a legal sense toward the owner of the hogs, for he was not bound to exercise even ordinary care toward trespassers, and the advent of the hogs upon his land was a trespass. His sole obligation toward trespassers was to abstain from wilful or wanton injury to his neighbor's stock. A licensor or one who permits others upon his property is obliged to exercise ordinary care but this is often slight. Unguarded excavations, stairwells, etc., in a new building, the existence of which is known to the workmen, do not constitute negligence on the part of the contractor at common law and in most jurisdictions. The contractor is bound, however, to warn his employees of new dangers confronting them, and, generally speaking, to render the place as reasonably safe as may be expected having regard to the ordinary exigencies of the work carried on there. In this connection it is proper to note the special legislation obtaining in some jurisdictions under which the contractor is obliged to insure his employees against injury. See **WORKMEN'S COMPENSATION LAWS**.

The third element of negligence must also be proved before the plaintiff may recover damages. He must show that he has sustained legal injury as the result of the defendant's negligence. The act of negligence must always be the proximate cause of the injury sustained. A common illustration of this is afforded in the average railroad or steamship accident where numbers of passengers are made ill by the shock of such accident due to negligence on the part of the owners or the railroad company. In many jurisdictions no cause of action is permitted on the ground that such illness is not the natural consequence of the negligence. Action is permitted, however, in many States, for mental anguish, shock, etc., even when there is no attendant physical injury. There is frequently experienced considerable difficulty in determining whether the injury sustained by the plaintiff is the proximate or remote effect of the defendant's negligence. The general test applied is whether there is an unbroken sequence of events forming an unbroken chain between the negligence and the injury. A master is responsible for the negligence of his servants, but in no case can redress be had where contributory negligence on the part of the plaintiff is proved. Negligence causing the death of a human being will subject one to criminal prosecution if such negligence is the proximate cause. In a factory fire in New York a few years ago 146 young girls lost their lives because, it was alleged, the factory proprietors had locked all the exits, thus depriving the girls of egress to the stairways and fire escapes, the ordinary methods of safety under such circumstances. The proprietors were indicted for manslaughter and narrowly escaped conviction. They were, however, held liable in tort in civil actions by defendants and relatives. NEGRI, nā'grē, **Ada**, Italian poet: b. Lodi, near Milan, 3 Feb. 1870. She became a school-teacher at Motta-Visconti, on the Ticino, and in 1892 published a small volume of poems, 'Fatalità,' which in Italy aroused a general interest and by 1894 had passed through six editions. She received from the city of Florence an honorary stipend of \$340 (1,700 lire) annually for a period of 10 years, and was appointed an instructor in literature at the Scuola Normale of Milan. Her further work includes the volume 'Tempeste' (1896); and 'Mater-nità' (1904). Much of her verse is an appeal for the working-classes. There is a German translation by Jahn of some of the poems. Consult Dornis, 'La Poesie italienne contemporaine' (1898); Guido Mazzoni in the 'Nuova Antologia' (Rome 1893).

NEGRITOS, nā-grē'tōz, the aboriginal negroid race inhabiting the Philippine Islands at the time of their discovery by the Spaniards who gave them this name, signifying "little negroes." They are found also on the Andaman Islands and the Malay Peninsula. They are believed to have sprung from the Negrillos of Africa, and to have reached their present habitat by migration. The race includes the Mincopies of the Andaman Islands; the Mantras and Sakaies of Malacca; and the Schobaengs of the Nicobar Isles. Some ethnologists include the Semangs, but it is objected to this that many of the latter are distinctly light in color, and the Negritos are black. In the Philippines they are called Aitas, Aëtas or Itas. The Negritos of the Philippines may be considered typical of their race and to be found in their greatest purity on Alabat Island, near Manila, and along the northeastern coast of Luzon, between Palawan and Cape Engano, and the interior woods of that section. The few families living upon the slopes of Mount Mariveles are regarded as the typical specimens of the race, and variations from this type as due to mixtures with other races. In the Philippines the Negritos have intermarried with the Ilongots of Luzon, the Mangayans of Mindoro and the Tagbanuas of Palawan and a great variation from type obtains. As a race they are of small stature, the men seldom more than four feet eight inches in height and the women four feet four inches. They have the brachycephalic or globular head form; their skin is

dark brown, almost black, and with a coppery hue; the hair is brownish black, very abundant, bushy and tensely frizzed, but the beard is scanty; and their features resemble those of the negroes, though the lips are not so thick. They are of slight build with thin, calfless legs, and become potbellied with age. The reach of the arms exceeds the height by from one to five inches. They are true savages, depending for their food upon hunting, fishing and the digging of wild roots. Their food is generally devoured in a raw state, though sometimes scorched or seared. They do not build villages nor stable huts, but roam through the mountains in small bands of six or eight families, sleeping at night on the ground around a common camp fire. They make baskets of a rude sort and their bows and arrows for hunting, lances for warfare and, in some sections, blowguns. Their only clothing is a girdle about the waist. For the rest they decorate the upper part of the body with a pattern work of scars formed by cuts with bamboo through the skin, into which is rubbed dirt to cause festering. They affect ornaments also; earrings, bracelets, anklets and necklaces, generally woven of palm fibre. Their intelligence is almost infantile in grade. They cannot count above five. They are exceedingly indolent and have never risen from their original low estate. They have few words in their language and their few customs are crude. They are cruel and often murderous, burying alive any one incurably sick or dangerously wounded. Their religion is one of ancestor worship, and they hold the graves of their dead in great veneration, and make long journeys to visit them. To this they add a short-lived worship of oddly shaped rocks and trees, shifting their reverence continually to newly-discovered objects. They have a few crude musical instruments, a sort of flute blown by one of the nostrils, and a stringed instrument of bamboo.

They are found only in the islands of Luzon, Panay, Palawan, Negros and Mindanao; and their number is estimated in the later United States reports as 20,000. Their origin and relationship to other races present many interesting ethnological questions which have not been satisfactorily settled; their geographical distribution, however, leaves little doubt that they were the original inhabitants of the Philippine Archipelago and at one time practically the sole possessors of the islands; they were probably driven back into the mountainous interior by invasions of primitive Malaysians. See **PHILIPPINE ISLANDS.**

NEGRO, a name properly applied to the races inhabiting the continent of Africa, originally between lat. 10° N. and 20° S. The term does not include the inhabitants of northern Africa, the Egyptians, Berbers, Nubians, Abyssinians and others. Neither do the Hottentots in South Africa belong to the Negro race. The term Negro, therefore, is not synonymous with African, and is not a national appellation, but denotes an ideal type constituted by certain physical characters, namely, black skin, woolly hair, flat nose, thick everted lips and a prognathous form of skull.

Out of Africa, Negroes are found in the United States, the West Indies, Brazil, Peru, the Cape Verde Islands and Arabia. They are

rare in Europe, Polynesia and Australia. Negroes were nearly unknown to the Hebrews and the Homeric Greeks; the Egyptians, however, about 2300 B.C., became acquainted with Negroes through the conquests of their rulers, and represented them on their monuments as early as 1600 B.C.; for nearly 35 centuries the type has remained unchanged in Egypt. Negroes were unknown to the Greeks until the 7th century B.C., their Ethiopians being merely any people darker than the Hellenic, like the Arabs, Egyptians, Libyans or Carthaginians, none of which are Negroes.

The Negro race is divided naturally into two great divisions: (1) African Negroes, (2) Papuans or Melanesians. There are four subdivisions of African Negroes, according to locality: (1) West Sudan and Guinea; (2) Central Sudan and Chad Basin; (3) East Sudan and Upper Nile; (4) South Africa. Authorities estimate their number at 130,000,000, with probably 20,000,000 full-blood or half-caste negroes, either slaves or descendants of slaves, chiefly in tropical or sub-tropical America, and enumerate the following as the chief anatomical and physiological points in which the Negro differs most from his own congeners:

1. The abnormal length of the arm, sometimes reaching to the knee-pan.
2. Prognathism (Facial angle 70°, in Caucasian 82°).
3. Weight of brain, 35 ounces (in gorilla 20 ounces, average Caucasian (Europe or America) 45 ounces).
4. Full black eye, black iris and yellowish sclerotic coat.
5. Short, flat, snub nose, broad at extremity, with dilated nostrils and concave ridge.
6. Thick, protruding lips, showing inner surface.
7. Very large zygomatic arches.
8. Exceedingly thick cranium, enabling him to use the head as a weapon of attack.
9. Weak lower limbs, terminating in a broad, flat foot, with low instep, projecting and somewhat prehensile great toe, and "lark heel."
10. Complexion deep brown, blackish, or even black, not due to any special pigment, but to the greater abundance of coloring matter in the Malpighian mucous membrane.
11. Short, black hair, distinctly woolly, not frizzly.
12. Thick epidermis, cool, soft and velvety, mostly hairless, and emitting a peculiar odor described as hircine.
13. Frame of medium height, thrown somewhat out of the perpendicular by the shape of the pelvis, the spine, the backward projection of the head and the whole anatomical structure.
14. The cranial sutures, which close much earlier in the Negro than in other races.

The native African Negroes display considerable ingenuity in the manufacture of weapons, in the working of iron, in the weaving of mats, cloth and baskets from dyed grasses, in the dressing of skins of animals, in the structure of their huts and household utensils and in the various implements and objects of use in a barbarous state of society. Their religion consists in the worship of idols and fetishes, representing a supreme power which they all acknowledge; they believe also in good and evil spirits, in witchcraft, charms and spells, omens, lucky and unlucky days, etc.; they make fetishes of serpents, elephants' teeth, tigers' claws and many similar objects, and reverence wooden images and sacred things, which they think have received a peculiar power from their divinities to drive away evil spirits, and protect them from danger, disease and witchcraft. They make prayers and offerings to their idols, and have sacred songs, festivals, dances, ceremonies and places; they sacrifice animals and sometimes human victims, especially during funeral obsequies; they have their priests and holy men, who are also magicians and doctors.

They believe generally in an after life, without any distinct idea of retribution, and some tribes in the transmigration of the human soul into a gorilla, or other bird, beast, reptile or fish. Being very fond of music, they have many ingeniously contrived musical instruments, generally of a noisy character; they have a keen sense of the ridiculous and are of a cheerful disposition; though cruel to their enemies and prisoners, and setting little value on human life, they are naturally kind-hearted, hospitable to strangers and communicative of their joys and sorrows; the females are remarkably affectionate as mothers and children, and as attendants on the sick, even to foreigners. They are less dirty in their persons and dwellings than most other barbarous races. For the history and development of the negro in America, see NEGRO IN AMERICA and NEGRO EDUCATION.

G., 'A Century of Negro Migration' (Washington 1918).

NEGRO IN AMERICA, The. In 1910 there were in the United States and its dependencies 10,215,482 persons of Negro descent. They were descendants of the slaves brought from Africa to America in the 15th, 16th, 17th, 18th and 19th centuries. The demand for workmen in the mines and on the plantations of the Spanish West Indies was the primary incentive for opening the African Slave Trade to America. A small European slave trade from Africa had begun with the voyage of the Portuguese sailor, Antonio Gonzales, to the River of Gold in 1442. This trade was soon turned toward America when the Indians failed as workmen and it was encouraged by King Ferdinand and the Emperor Charles V. The Bull of Demarcation having debarred Spain from African possessions, she was compelled to secure her slaves through contract with the Portuguese and later with other trading nations. This contract for supplying the Spanish Indies with Negroes became to be a great commercial prize and the zeal with which the Portuguese, Dutch and English successively filled these contracts was the main means of transplanting this race.

The African Slave Trade thus established cost Negro Africa 100,000,000 souls. It disorganized Negro culture and industry, stopped the development of art, overthrew governments and was the cause of that modern stagnation of culture which has marked the Dark Continent since 1600.

Early Immigration.—The exact number of Negroes brought to America will, of course, never be known. Dunbar estimates that nearly 900,000 came to America in the 16th century, 2,750,000 in the 17th, 7,000,000 in the 18th and over 4,000,000 in the 19th, less than 15,000,000 in all. In the limits of the United States the growth of the black population has been steady and has even since the cessation of the slave trade far outstripped that of any other of the

original groups of Americans. In colonial times the slaves went mainly to the West Indies, and, although a few landed in Virginia as early as 1619, they were not brought to the continent in large numbers until England secured the Spanish contract in 1713. At that time there were perhaps 50,000 Negroes in continental America; by 1727 this had reached 75,000, and the subsequent increase is estimated by Bancroft as follows:

1750.....	220,000
1754.....	260,000
1760.....	310,000
1770.....	462,000
1780.....	511,000

Exact statistics as given by the census reports beginning in 1790 show the following figures for Negro population within the limits of continental United States and excluding dependencies:

DATE	Total negroes	Per cent of increase	Per cent of increase of whites	Per cent of total population
1790.....	757,208			19.27
1800.....	1,002,037	32.33	35.76	18.88
1810.....	1,377,808	37.50	36.12	19.03
1820.....	1,771,656	28.59	34.12	18.39
1830.....	2,328,642	31.44	34.03	18.10
1840.....	2,873,648	23.40	34.72	16.84
1850.....	3,638,808	26.63	37.74	15.69
1860.....	4,441,830	22.07	37.69	14.13
1870.....	4,880,009	9.86	24.76	12.66
1880.....	6,580,793	34.85	29.22	13.12
1890.....	7,488,789	13.79	26.68	11.93
1900.....	8,833,994	18.00	21.20	11.60
1910.....	9,827,763	11.20	22.30	10.70
1920.....	10,463,131	6.50	21.40	9.90

The census of 1870 was defective and probably that of 1890, also, which would explain the chief irregularities in the rate of increase of Negroes. The higher rate of increase of the whites is due to the large immigration.

History.—The history of the Negro in America up until 1863 is largely the history of slavery (q.v.). And yet he was not altogether the passive victim of the system. In the earlier days the tendency was to recognize him as a kind of feudal serf, not essentially different from the white serfs. Consequently, when freed, the free black had in many cases the right to vote and intermarried with the white servant class. Gradually, however, a color caste arose which condemned a person of Negro descent to civil and legal inferiority, no matter whether he was technically a slave or not. The Negroes did not submit to slavery or caste restrictions wholly without a struggle. Before 1850, while the fire of African freedom still burned in the veins of the slaves, there was in all leadership or attempted leadership but the one motive of revolt and revenge,—typified in the terrible Maroons, the Danish blacks and Cato of Stono, and veiling all the Americans in fear of insurrection. The liberalizing tendencies of the latter half of the 18th century brought, along with kindlier relations between black and white, thoughts of ultimate adjustment and assimilation. Such aspiration was especially voiced in the earnest songs of Phillis, in the martyrdom of Attucks, the fighting of Salem and Poor at Bunker Hill, the intellec-

tual accomplishments of Banneker and Derham and the political demands of the Cuffes. Stern financial and social stress after the Revolutionary War cooled much of the previous humanitarian ardor. The disappointment and impatience of the Negroes at the persistence of slavery and serfdom voiced itself in two movements. The slaves in the South, aroused undoubtedly by vague rumors of the Haitian revolt, made three considerable attempts at insurrection,—in 1800 under Gabriel in Virginia, in 1822 under Vesey in Carolina and in 1831 again in Virginia under Nat Turner. In the free States, on the other hand, a new and curious attempt at self-development was made. In Philadelphia and New York color-proscription led to a withdrawal of Negro communicants from white churches and the formation of a peculiar socio-religious institution among the Negroes known as the African Church,—an organization still living and controlling in its various branches over a million of men.

Walker's wild appeal against the trend of the times showed how the world was changing after the coming of the cotton-gin. In 1830 slavery seemed hopelessly fastened on the South, and the slaves thoroughly cowed into submission. The free Negroes of the North, inspired by the mulatto immigrants from the West Indies, began to change the basis of their demands; they recognized the slavery of slaves, but insisted that they themselves were freemen, and sought assimilation and amalgamation with the nation on the same terms with other men. Thus, Forten and Purvis of Philadelphia, Shad of Wilmington, Du Bois of New Haven, Barbadoes of Boston and others strove singly, and together as men, they said, not as slaves; as "people of color," not as "Negroes." The trend of the times, however, refused them recognition, save in individual and exceptional cases; considered them as one with all the despised blacks; and they soon found themselves striving to keep even rights they formerly had of voting and working and moving as free men. On the other hand, it was impossible to suppress wholly the upward struggles of the free Negro or even of the exceptionally gifted slaves. When the war with England broke out, Negroes fought in the ranks; they helped man the victorious ships in the struggle of 1812, and finally in the Civil War turned the scale of victory for the North at a critical point. The number of free Negroes was as follows:

1790.....	59,466
1800.....	108,435
1810.....	186,476
1820.....	233,631
1830.....	319,599
1840.....	386,293
1850.....	434,495
1860.....	448,070
1870.....	4,880,009

Barred out of the labor market by slavery, on the one hand, and color prejudice, on the other, these Negroes were in a desperate condition; and even in the free States "black laws" curtailed their civil rights. Nevertheless, they struggled bravely. In 1830 they held their first national convention in Philadelphia, and began to agitate for civil rights and education, and to discuss schemes of migration to Canada and elsewhere. As the abolition movement grew it received substantial aid from free

Negroes; it was in a Negro church in Boston that the American Anti-Slavery Society was formed, and the first subscribers to Garrison's *Liberator* came from a Philadelphia Negro, James Forten. Led by Remond, Nell, Wells-Brown and Douglass, a new period of self-assertion and self-development dawned. To be sure, ultimate freedom and assimilation was the ideal before the leaders, but the assertion of the manhood rights of the Negro by himself was the main reliance, and John Brown's raid was the extreme of its logic. After the war and emancipation, the great form of Frederick Douglass, the greatest of American Negro leaders, still led the host. Self-assertion, especially in political lines, was the main program, and behind Douglass came Elliot, Bruce and Langston, and the Reconstruction politicians, and, less conspicuous but of great social significance, Alexander Crummell and Bishop Daniel Payne.

Civil Rights.—As a slave, the Negro could be (1) sold or given away by his legal owners, (2) seized for debt, (3) separated from his family, (4) could own no property, (5) had no right to vote, (6) could not hold office, (7) nor could he testify in a court of law, save in suits for his own freedom. (8) He could not legally marry, (9) nor trade or make contracts. (10) He could not move about without permission, (11) could be punished corporally and even killed by the master in some cases and (12) was not permitted to learn to read and write. Being thus legally deprived of all essential rights of manhood, he was utterly defenseless before the aggressions of the unscrupulous, even in matters of life and limb. Free Negroes in slave States, like Virginia and North Carolina, were disfranchised early in the 18th century; later their right to testify in courts was taken away, then the right to hold any office, and finally legal pressure was brought to bear in the shape of vagrancy laws and curtailment of economic freedom, so as to force them into slavery or drive them from the State.

The free Negroes of the North were very generally subject to codes of "Black Laws" which varied from State to State. Those of Ohio as adopted and amended in 1804, 1807, 1824, and later, prohibited Negroes from settling in the State unless they could show a certificate of freedom and give bonds guaranteeing good behavior and self-support; a Negro was disqualified from testifying in court trials where a white person was a party, or to serve as a jurymen in any case; his children were excluded from the public school; finally he could not vote. Some States had less rigorous laws and tended to alleviate the position of the blacks; others tended toward greater restrictions.

When the Civil War came, despite disclaimer and compromise, the Negro was the central issue. The first pressing question was the treatment of fugitive slaves; Butler confiscated them as "contraband of war," Fremont sought to free all slaves and Halleck sought to catch and return them. Finally beginning at Port Royal, S. C., under Pierce and extending to Fortress Monroe, New Orleans, Vicksburg, Cairo and wherever these fugitives were massed, there grew up systems of controlled Negro labor under the guardianship of government officials. General Banks, for instance had

90,000 ex-slaves under him in Louisiana, with 50,000 laborers under his guidance and an annual budget of \$100,000. He made out 4,000 pay rolls a year, registered the freedmen, inquired into and redressed all grievances, laid and collected taxes and established a public school system. Colonel Eaton in Tennessee, General Saxton in South Carolina and others had similar work in charge.

Meantime, missionary and freedmen's aid societies began sending money, clothes and teachers south, and there was a demand that the government take hold of this work, unify it and help make easier the transition of 4,000,000 persons from slavery to freedom. This was the genesis of the Freedmen's Bureau. This "Bureau of Refugees, Freedmen and Abandoned Lands" was established as a part of the War Department by the Act of 1865, and was modified and extended by the Act of 1866; the larger part of its functions ceased in 1869. General O. O. Howard conducted this Bureau and "scarcely any subject that has been legislated upon in civil society failed at one time or another to demand the action of this singular Bureau." The Bureau had in its period of greatest activity 900 officials scattered from Washington to Texas. Their work included (1) the relief of physical suffering caused by the war; (2) the overseeing of the beginnings of free labor; (3) the buying and selling of land for the freedmen; (4) the establishment of schools; (5) the payment of bounty money to Negro soldiers; (6) the administration of justice between white and black in the Bureau courts.

The Bureau distributed 21,000,000 free rations in 50 months, treated 500,000 patients in 60 hospitals and asylums, transported 30,000 fugitives back to the plantations, and made many thousands of contracts for the new free laborer. Little was done in the matter of furnishing the freedmen with land, as the confiscated plantations were restored under the amnesty measures; but aided by the "carpet-bag" governments and the missionary societies a system of common schools and higher institutions was founded and nearly \$6,000,000 spent on it. The Bureau courts were not successful and the general attitude of the whites was bitterly hostile to the institution. Such was the work of the Freedmen's Bureau. To sum it up in brief, we may say: it set going a system of free labor; it established the black peasant proprietor; it secured the recognition of black freemen before courts of law; it helped to found the free public school in the South. On the other hand, it failed to establish good will between ex-masters and freedmen; to guard its work wholly from paternalistic methods that discouraged self-reliance; to make Negroes landholders in any considerable numbers. Its successes were the result of hard work, supplemented by the aid of philanthropists and the eager striving of black men. Its failures were the result of bad local agents, inherent difficulties of the work and national neglect. The Freedmen's Bureau expired by limitation in 1869, save its educational and bounty departments. The educational work came to an end in 1872, and General Howard's connection with the Bureau ceased at that time. The work of paying bounties was transferred to the Adju-

tant-General's office, where it was continued three or four years longer.

The Freedmen's Bureau really ended in the 14th and 15th Amendments to the Constitution (1868 and 1870) giving Negroes the right of suffrage. The last efforts of Charles Sumner were given to the Civil Rights Act of 1875, which forbade the exclusion of Negroes from public conveniences and places of entertainment on account of color. This was afterward declared an interference with the rights of the States by the Supreme Court, and, therefore, unconstitutional. The matter of civil rights of Negroes is, therefore, to-day left to the States, and has resulted in widespread discrimination in the former slave States. Whites and Negroes are separated in schools, railway trains, hospitals, jails and graveyards by law, and by custom in hotels, theatres, lectures, libraries and churches, and often in street cars and elevators. Beside this there is a tendency to limit all economic and social intercourse to the barest amount necessary among neighbors. Inter-marriage is forbidden and the concubinage of black women, though decreasing, is still considerable; and while it is very difficult to secure the punishment of a white man who violates a black woman, the black man who is even accused of rape against a white woman is usually lynched before he has had a legal trial. These separating laws and centrifugal tendencies have gone beyond reason, and the better thought of the South realizes it. In the future it is probable that lynching will cease, and kinder intercourse be cultivated.

Political Rights.—Free Negroes voted in many of the colonies in early times, when otherwise qualified, but later the privilege was taken away, as in Virginia in 1723. In the free States they continued to vote, but later were restricted sometimes by special qualifications, as in New York in 1821, or by limiting the suffrage to whites, as in Pennsylvania in 1838. The 14th Amendment to the United States Constitution sought to penalize States which reduced the electorate, and the 15th Amendment made discrimination on account of race and color in the qualification of voters illegal. These enactments were made necessary by the opposition of the South to the Freedmen's Bureau and the evident determination of the Southern legislatures to re-enslave the freedmen to all intents and purposes by civil restrictions, vagrancy laws and special legislation. The result of the Amendments was to throw the government of the Southern States largely into the hands of the freedmen during the years 1866-76. So, sudden increase of the electorate in any community would mean a period of disturbance and difficulty, but with honest leadership the outcome might have been different. As it was, dishonest and self-seeking politicians from both North and South sought to use the ignorant Negro voters for their own ends, and much extravagance and some misgovernment ensued. Nevertheless, it has been truly said of these Negro governments:

They obeyed the Constitution of the United States, and annulled the bonds of States, counties, and cities, which had been issued to carry on the war of rebellion and maintain armies in the field against the Union. They instituted a public school system in a realm where public schools had been unknown. They opened the ballot box and jury box to thousands of white men who had been debared from them by a lack of earthly possessions. They introduced home

rule into the South. They abolished the whipping post, the branding iron, the stocks and other barbarous forms of punishment which had up to that time prevailed. They reduced capital felonies from about twenty to two or three. In an age of extravagance they were extravagant in the sums appropriated for public works. In all of that time no man's rights of person were invaded under the forms of law. Every Democrat's life, home, fireside and business were safe. No man obstructed any white man's way to the ballot box, interfered with his freedom of speech or boycotted him on account of his political faith.

And a Negro legislator of that period in South Carolina said in defense of his race that the men who criticised the extravagance of the period between 1869 and 1873 failed to mention

"Those imperishable gifts bestowed upon South Carolina between 1873 and 1876 by Negro legislators—the laws relative to finance, the building of penal and charitable institutions, and, greatest of all, the establishment of the public school system. Starting as infants in legislation in 1869, many wise measures were not thought of, many injudicious acts were passed. But in the administration of affairs for the next four years, having learned by experience the result of bad acts, we immediately passed reformatory laws touching every department of state, county, municipal and town governments. These enactments are to-day upon the statute books of South Carolina. They stand as living witnesses of the Negro's fitness to vote and legislate upon the rights of mankind."

Nevertheless, by force and fraud the Negro governments were overthrown about 1876, and from that time until the present the Negro has been disfranchised either by physical compulsion or cheating at the polls or ingenious legislation. The effects of these methods were so unfortunate that there arose in the South about 1890 a movement to deprive the Negro of his vote by legal enactment. This has been practically accomplished now in Mississippi, Louisiana, South Carolina, North Carolina, Alabama and Virginia, and movements in that direction have been started in other States. The avowed objects of these constitutional amendments have been (a) To disfranchise no white voter; (b) To disfranchise as many Negroes as possible. This has been accomplished by the following measures:

1. **Illiteracy.**—The voter must be able to read and write. (This discriminates against Negroes because the Negro public school system in the South is much poorer than that of the whites).
2. **Property.**—The voter must own not less than \$300 worth of taxable property and pay taxes on it. (This of course, discriminates against a poverty-stricken race of freedmen who could not legally hold property prior to 1863, and who to-day suffer in economic competition by reason of their color and training).
3. **Poll Tax.**—A voter must have paid his poll tax. (This is a source of discrimination only when it extends back for several years, as in Virginia).
4. **Occupation.**—A voter must have a regular occupation. (This is designed to shut out Negro laborers, and is a source of discrimination because of the difficulty of proving its truth).
5. **Army Service.**—Soldiers or their descendants may vote. (Thoroughly vicious like the preceding).
6. **Character.**—Persons of "good character" who "understand the duties of citizenship may vote." (This is a source of much discrimination and puts too much power in the hands of the registrars).
7. **"Grandfather" Clause.**—Persons who could vote 1 Jan. 1867 or their descendants may vote if registered within a limited time. (This is a thoroughly vicious attempt to admit ignorant white voters when the same class of blacks are barred).
8. **"Understanding" Clause.**—Persons may vote who "understand" a clause of the Constitution and can explain it when read to them. (Another indefensible provision designed to shut out blacks arbitrarily by placing large powers of discretion in the hands of local registrars.)

Thus far States have adopted the above qualifications as follows:

Mississippi.—The literacy (1) qualification or the "understanding" clause (8) together with the poll tax (3) provision.

Alabama.—The army service (5) and character. (6) clauses for persons registering prior to 1903; thereafter the literacy clause (1) and occupation clause (4), or the property qualification (2).

South Carolina.—For those registering before 1898, the literacy clause (1) except that writing is not required, or the understanding clause (8); after 1898 the literacy (1) or property (2) qualifications.

Louisiana.—Literacy (1) or property (2) clauses, in addition to the "grandfather" clause (7) which originated here.

North Carolina.—Literacy (1) and poll tax (3) provisions, and "grandfather" clause.

Virginia.—For those registering before 1904, army service (5) or property clauses (2); or literacy (1) and understanding clauses (8). After 1904, poll tax clause (3) providing the tax has been paid for three years, and literacy clause (1). Army service (5) excuses from the poll tax (3).

Georgia.—Literacy clause (1) or property clause (2) or Army service (5) or character clause (6).

The more flagrant provisions of these laws are unconstitutional and the "Grandfather" clauses have already been declared null and void by the United States Supreme Court. If the Negroes progress in the future as hitherto they cannot permanently be deprived of the suffrage.

Economic Status.—The occupations of Negroes according to the latest census report were as follows showing 71 per cent of total Negroes 10 years of age and over in gainful occupations:

Agriculture, etc.	2,893,380
Domestic and personal service.	1,112,182
Manufacturing and mechanical industries	631,421
Transportation	255,969
Trade	119,491
Professional service.	67,245
Extraction of minerals.	61,129
Public service.	22,382
Clerical occupations.	19,336

This shows that most of the freedmen's sons are farmers and servants, as one would expect.

Statistics of ownership of property show that in the Southern States Negroes owned 430,449 homes or 22.4 per cent of all the homes which they occupy. The corresponding figure for 1890 was 18.9 per cent. If we consider particularly Negro farmers, we find that in the country districts of the South emancipation has been but partial, and that the Negro serf is still bound to the soil by peonage, plantation stores and a system of crop mortgages. Nevertheless 922,914 Negro farmers in 1920 operated farms with a total area of 41,318,496 acres. Of the farms operated 217,584 were owned by Negroes.

Colored owners increased 16.8 per cent during the decade from 1900 to 1910, and the land in these farms from 15,976,098 to 19,076,463.

Beside these independent farmers there are a vast number of Negro laborers, who raise the crops on the farms of the white farmers.

Negroes are just entering into lines of commercial business. There are 20,653 retail dealers, 953 undertakers, 336 bankers, 1,833 insurance agents and officials.

A list of the principle specific occupations of Negroes in the United States follows:

SEX AND OCCUPATION.

Males	3,178,554
Farm laborers	981,922
Farmers	798,509
Laborers — building and hand trades	166,374
Laborers — saw and planing mills	91,181
Laborers — steam railroad	86,380
Porters, except in stores	51,471
Draymen, teamsters, and expressmen	50,689
Coal mine operatives	39,530
Laborers, porters, and helpers in stores	36,906
Waiters	35,664
Laborers — road and street building and repairing	33,914
Cooks	32,453
Deliverymen — stores	30,511
Carpenters	30,464
Janitors and sextons	22,419

Barbers, hairdressers and manicurists	19,496
Retail dealers	17,654
Clergymen	17,427
Longshoremen and stevedores	16,379
Laborers — brick, tile and terra-cotta factories	15,792
Firemen (except locomotive and fire department)	14,927
Lumbermen and raftsmen	14,005
Laborers — blast furnaces and rolling mills	13,519
Hostlers and stable hands	12,965
Laborers — public service	12,767
Brick and stone masons	12,401
Garden laborers	11,801
Laborers — domestic and personal service	10,380
All other occupations	500,699

Female 2,013,981

Farm laborers	967,837
Laundresses (not in laundry)	361,551
Cooks	205,939
Farmers	79,309
Dressmakers and seamstresses (not in factory)	38,148
Teachers — (school)	22,441
Nurses (not trained)	17,874
Chambermaids	14,071
Laundry operatives	12,196
Housekeepers and stewardesses	10,021
All other occupations	284,594

Social Condition.—The illiteracy of the Negro population 10 years of age and over has decreased as follows:

	Per cent
1870	80
1880	70
1890	57.1
1900	44.5
1910	30.4
1920	22.9

In the parts of the United States where deaths are regularly registered the death-rate of Negroes was 32.4 per 1,000 in 1890, 30.2 in 1900 and 25.5 in 1910. The corresponding figures in cities are 33.7, 31.1 and 27.5. In neither case do these figures apply to those rural districts where the Negro population is massed.

In 1914 the Negro death rate had fallen to 21.9 per thousand as compared with 13.1 for the whites. Comparison as to specific diseases shows these rates per 10,000 living:

	White	Colored
Typhoid	14.3	35.9
Malaria	1.6	14.8
Whoopingcough	9.2	32.0
Influenza	8.6	18.8
Tuberculosis of the lungs	115.2	363.8
Pneumonia	122.0	220.8
Nephritis, etc.	98.8	168.5

The high record for diseases of the lungs shows a progressive decrease.

	1890	1900	1914
Consumption	546.11	490.6	363.8
Pneumonia	278.97	349.0	220.8

The Negro death rate is lower for Negroes than whites in measles, scarlet fever, diphtheria and cancer. Infant mortality among Negroes is still very high.

There were during the year 1910 112,436 colored prisoners committed and 103,267 discharged. On 1 Jan. 1910 there were 42,631 prisoners in confinement, of whom 41,729 were of Negro descent. Unfortunately comparisons with former census reports are impossible, owing to differing methods, but the commitments for petty crimes of misdemeanors would seem high.

The home life of the Negro has greatly improved since emancipation. The one room cabin is slowly disappearing, the chastity of girls is being protected more effectively and the development of social classes and organizations has received great impetus.

The habitat of the Negro population has shown no great change until the recent migration northward. The centre of Negro population is in De Kalb County, Ala. South Carolina and Mississippi have over half their population Negro; Louisiana, Alabama, Georgia and Florida have from 37½ to 50 per cent Negro; Arkansas, Virginia and North Carolina have from 25 per cent to 37½ per cent.

THE NEGRO POPULATION SECTIONS IN 1920.	
South Atlantic.....	4,325,120
East South Central.....	2,523,532
West South Central.....	2,063,579
Total South.....	8,912,231
New England.....	79,051
Middle Atlantic.....	600,183
East North Central.....	514,554
West North Central.....	278,521
Total North.....	1,472,309
Mountain.....	30,801
Pacific.....	47,790
Total West.....	78,591

Following the Civil War the dearth of labor caused a considerable migration from the South northward. In 1922-23 this emigration was very pronounced, the number of such emigrants for the year ending 1 Sept. 1923 being estimated by the United States Department of Labor at 478,700.

In 1860 only 4.2 per cent of the Negroes were in cities of 8,000 or more inhabitants; in 1890 this had increased to 12 per cent. In 1910 the urban Negro population numbered 2,684,797 and the rural, 7,142,966; in 1920, Negroes in cities numbered 3,559,473 and those in the country, 6,903,658.

The church census of 1906 showed 36,770 Negro church organizations, with churches seating 10,481,738 persons, and property valued at \$56,636,159. There were 3,685,097 church members. The largest churches are the Baptists (2,261,607 members) and the Methodists (M. E., 308,551 members; African M. E., 494,777 members; African M. E. Zion, 184,542 members; Colored M. E., 172,996 members).

Amalgamation of Blood.—The Negroes of America are not of pure Negro blood. There has gone on in the country first an intermingling of the various African tribes transported and, secondly, a large infusion of white blood. The census reports of this latter intermingling are admittedly far below the truth:

1850.....	405,751	mulattoes or	11.2%	of all Negroes
1860.....	588,352	"	13.2%	" "
1870.....	585,601	"	12.0%	" "
1890.....	1,132,060	"	15.2%	" "
1900.....	2,050,686	"	20.9%	" "

Literature and Art.—The chief contribution of the Negro to American art has been his beautiful and plaintive folkmusic. This music has been developed by composers like J. Rosamond Johnson and Harry Burleigh. Henry O. Tanner, the artist; W. S. Braithwaite, the poet and critic; Charles W. Chesnut, the novelist; and Kelly Miller, the essayist, are colored. Other distinguished Negroes have been Frederick Douglass, the Abolitionist; Paul Laurence Dunbar, the poet; Ira Aldridge, the actor; Daniel Payne, the bishop, and Booker T. Washington, the educator.

References.—The history of the Negro prior to emancipation will be found in the

abundant literature of slavery. Official sources of information are the United States census reports, especially 1850-1900.

Bulletins of the United States Department of Labor, Publications of Atlanta University and Johns Hopkins University. The more important single works are Frederick Douglass' 'Autobiography'; Williams' 'History of the Negro Race'; Washington's 'Up From Slavery'; Gidding's 'Exiles of Florida'; Chesnut's 'Marrow of Tradition'; McCulloh's 'Human Way'; Dunbar's 'Lyrics of Lowly Life'; Krehbiel's 'Afro-American Folk Songs'; Kelly Miller's 'Race Adjustment'; Hart's 'The Southern South'; Lynch's 'Facts of Reconstruction'; Johnson's 'Autobiography of an Ex-Colored Man'; Du Bois' 'Souls of Black Folk.'

Author of 'The Souls of Black Folk'; 'The Negro,' etc.

NEGRO DISFRANCHISEMENT. Negroes have been practically disfranchised in the States of Alabama, Kentucky, Louisiana, Mississippi, North Carolina, Virginia, South Carolina and Georgia. The chief method used in disfranchising the negro in the Southern States has been and is a high educational test as a qualification for voting, which includes the ability to "interpret" any part of the State constitution. The so-called "grandfather clause," by which any person who voted in or before 1867 or 1868 (the details of the law differed in different States) was entitled to a vote, was nullified by the United States Supreme Court for the States of Maryland and Oklahoma on 21 June 1915. The first Constitutional Convention disfranchising the negro was that held in Mississippi in 1890; when the educational qualification mentioned above was made part of the constitution of the State. Previous to that time the imposition of a poll tax was for some years effective in the Southern States. The other constitutional means of disfranchising the negro, to quote Prof. Charles A. Beard's 'Contemporary American History,' are "a small property qualification" and "the wide extension of disfranchisement for crimes by including such offenses as obtaining money under false pretenses, adultery, wife-beating, petit larceny, fraudulent breach of trust, among those which work deprivation of the suffrage."

NEGRO EDUCATION. The first problem of the South was to enlighten the Negroes brought from the African wilds. In accepting the institution of slavery, intelligent masters were easily convinced that Negroes who had some conception of modern civilization and understood the language of their owners would be more valuable than wild men with whom one could not communicate. Not a few slaveholders, however, believing that slaves could not be enlightened without developing in them a love for liberty, maintained that the more brutish the bondmen the more pliant they become for purposes of exploitation. The attitude of the Southern white people toward the Negroes, therefore, had been variable, but the unbenevolent planters finally won the majority of Southerners to their way of thinking and determined that Negroes should not be elevated to the dignity of manhood.

The early advocates of the education of the

Negroes were masters who desired to increase the efficiency of their labor supply, sympathetic persons who wished to help the oppressed and zealous missionaries sent out for the propagation of the gospel in the New World. Of these three classes the masters were the most effective. The slaveholders, then, just as planters do now, dealt with the situation to suit themselves regardless of public opinion and the law. When measures were passed to prohibit the education of slaves some masters continued to teach Negroes in defiance of the hostile legislation. Sympathetic persons, however, did not accomplish much. Like many of the Northerners whose interest in the Negro to-day is limited to an academic discussion of the race problem, these persons were content to dwell in practically free settlements far from the plantations on which the bondmen lived. The missionaries were generally successful in teaching Negroes, especially after the removal of their greatest impediment through the abrogation of the unwritten law that a Christian could not be held a slave. The French and Spanish Catholics, the Puritans, Anglicans, Quakers, Presbyterians, Methodists and Baptists shared this important task.

This movement, however, was to develop into something more potential than that of merely enlightening the blacks to bring them into the church. The necessary impetus was supplied by the spreading of the nascent social doctrine incident to a general study of the political philosophy of Milton, Blackstone, Baxter and Locke to justify the coming of the lowly to power. When Patrick Henry and James Otis demanded liberty for the colonists, Daniel Appleton, John Woolman, Anthony Benezet and Mathew Clarkson demanded the liberation of the Negroes' bodies that they might enjoy freedom of mind. These reformers were somewhat successful. The frequent acts of emancipation which followed this change in the attitude toward persons of color turned loose upon society a large number of men whose chief needs were education and training in the duties of citizenship. The result was that friends of the colored people established throughout the country a number of schools which effected a material change in the condition of the blacks and served them so well that many of these institutions are intact to-day.

These new efforts made possible more significant achievements throughout the country. Negroes became more useful as servants, some proved to be first-class artisans and not a few exhibited the power to rise in the business world. It was the day of Cæsar, the doctor, Phyllis Wheatley, the writer of verse, Andrew Fuller, the mathematician, and Benjamin Banneker, the surveyor and astronomer. Even slaves attached to the masters' homes learned the rudiments of education in schools maintained for white children. A few bondmen were reading and writing French, Spanish and German. Some of them were associated with indentured servants in the teaching of white persons.

The more general advancement of the Negroes, however, was made in their religious development. The American Revolution effected a remarkable change in the attitude of Christians toward the black population.

Negroes were extensively instructed by pious whites, many of them were taken into the church on the basis of equality and a few were trained to share the propagation of the gospel among the neglected classes. They so impressed their hearers that scores of them were invited to preach to white congregations. Among those who enjoyed this privilege were Jacob Bishop, sometime pastor of the First Baptist Church (white), Portsmouth, Va.; John Chavis, Henry Evans, Ralph Freeman, Harry Hosier, Black Harry of Saint Eustatius, Lemuel Haynes and S. R. Ward.

These favorable conditions, however, did not continue in many parts of the South later than the second quarter of the 19th century. The rapid strides of certain Negroes and the tendency of some to organize insurrections could not but startle a large number of Southerners who easily found reason for eliminating them from the higher classes and making them tools in the hands of the rich planters produced by the industrial revolution. In the most Southern States, therefore, laws were enacted to reduce the negroes to the plane of beasts. These measures not only put an end to the helpful contact of the Negroes with white people but closed the colored schools and made it a crime for a Negro to teach his own child. Slaves once sought as valuable because of their mental development were thereafter regarded as dangerous to the peace of the South. Having then no incentive to struggle upward, most slaves tended to become heathen-like, and Negroes brought in the rough from Africa found among their fellows in the Christian world nothing to encourage the pagan to live a better life. Ignorance of the fact that a degraded laboring class is an impediment to the economic progress of the country, the South paid this price to protect its pet institution.

Ambitious slaves and free Negroes could not suffer the humiliation which such a reaction entailed. Many of them, therefore, moved North and established settlements to which fugitive slaves learned to repair. The coming of these people to the North increased the number of progressive Negroes in that section, making possible greater achievements in education. In Washington and Baltimore, though not in the North but more liberal than the lower South, free Negroes accumulated sufficient wealth to make themselves comfortable and to provide for their posterity. Many became owners of property in Philadelphia as they had there the assistance and protection of the Quakers. In New York the economic progress of the free Negroes was referred to by the anti-slavery societies as the reason why they could provide better facilities of education for their children. It was not uncommon to find a property holder, a trader or merchant among the Negroes of New England. Later in the first half of the last century, however, less progress was noted. The change came when the intolerable conditions in the South drove Negroes to Northern communities where, on account of the fear of being burdened by undesirables, some white people not only ceased to help them, but undertook to frighten them from that section.

The progress of the free blacks in favorable Northern communities, however, convinced a

few Southerners that the attitude of their sections toward the uplift of the Negroes was wrong. Men of both sections, therefore, endeavored to show that the South was its own tremendous handicap. Certain planters in North Carolina and Georgia began to advocate the repeal of the laws which prohibited masters from teaching their slaves to read. In North Carolina the matter ended with bringing a memorial on this subject before the legislature. The reform party of Georgia, however, carried the matter further. A bill providing for the repeal of the undesirable law was introduced in the legislature, piloted through the lower chamber and all but enacted in the upper house. These facts show that had not the Civil War broken out as early as it did the South would have for economic reasons taken other steps for the improvement of the Negroes.

The forces effective in the development of Negro education since the Civil War have been the enterprise of the negroes themselves, their Southern friends and philanthropists of the North. Negro teachers who had braved the dangers of disregarding public opinion and even of violating laws hostile to their education eagerly grasped the opportunities vouchsafed by the triumph of the Union forces. They at once became, so to speak, shining lights which had long lay hidden under a bushel. Many Negroes who, because of the persecution of those of their race known to be enlightened, had never posed as educated persons, were found to be well equipped for this important work of the remaking of the race through education.

More successful than these, however, were the teachers and preachers of the white race, who volunteered to work among the freedmen. At first there were teachers among the victorious Union soldiers, who gave the Negroes in certain parts of the South their first opportunity for enlightenment. Then came the more effective work of the representatives of the numerous northern agencies intended to elevate the Negroes. Desiring to promote liberal education these workers established a number of schools, sometimes undertaking the work of colleges and universities, with a view to offering the undeveloped mind of the Negro every opportunity for growth. Yet although having a common impulse and struggling to reach the same end, these agencies, to some extent, defeated their own purposes through failure to systematize their efforts and co-operate with others in the field. Their most unfortunate blunder was to undertake to do for the Negro through education, in a generation, what it had not done for the white race in centuries.

There arose too a number of schools resulting from the initiative of the Negroes themselves. These, however, following in the footsteps of the systems already in the field, promoted in many cases a reduplication of effort for special ends as they were too often founded by ambitious leaders and supported by Negro churches for denominational reasons. But these schools have been decidedly helpful, not only in the actual work done, but in showing the initiative of the Negro and his determination to be educated even at his own expense; they have been a factor in securing aid from others. Persons called upon to aid Negro educa-

tion always give serious consideration to what the Negroes have done for themselves.

Along with these institutions worked also those established by the State. The Negroes themselves gave the South its first effective public schools during the Reconstruction period. As these systems, however, were democratic, giving equal facilities to the Negro and sometimes even the privileges of the coeducation of the blacks and whites, this work was undone, when the aristocratic whites regained control. These radicals, however, did provide for some sort of education of the Negro in segregated public schools. These schools have never been adequate to the crying need for the education of the masses, but as a result of the interest of certain liberal Southerners like Haygood, Curry, Ruffner, Northern, Vance and Dillard, they have been considerably improved. The Negro public schools, however, have always constituted an impoverished group, the sum spent on colored pupils per capita, even to-day, being \$2.89, while that for the white schools is \$10.32. Above these common schools the Southern States have established also 28 higher institutions, 16 of which are supported partly by the Federal government as land grant schools. The total income of these institutions to-day is \$963,611 and the value of their property \$5,727,608. The annual income of the land grant colleges is \$544,520. The Federal government appropriates to their support \$259,851 of this amount and the States \$263,094.

These appropriations being inadequate, the Negro has had to depend in many cases on Northern philanthropy. The North, therefore, has been called on not only to send its sons and daughters as teachers of Negroes, but has purchased for them school property valued at \$26,191,892 and contributes annually \$2,645,577 to the support of their schools. The total annual income for current expenses in all colored private schools is now \$2,026,460 and the value of the plant equipment and endowment of the same \$28,496,946.

These schools as a whole, though inadequately supported, rendered valuable service. A majority of the useful Negroes now serving their race effectively were trained in these institutions. It was evident, however, that this educational system did not supply the needs of an undeveloped people. They were not sufficiently equipped to compete with the white institutions in achievements in the literary world and failed to enable the Negro to solve the problem of their economic struggle. Thereupon appeared Booker T. Washington, who in emphasizing the Hampton idea of education effected a revolution by dissociating it from leisure and luxury and connecting it with the life of the individual. The movement for the enlightenment of the Negro, therefore, has been well worth while, if it had done nothing more for the world's good than to produce Booker T. Washington, the only American who has ever revolutionized an educational system.

This leader's task in inducing the world to recognize the sanity of his educational program was not easy. There was a natural antagonism to be expected from those enthusiastic white people who, believing that the Negro was to have special problems to solve, contended that the problem of promoting his gen-

eral progress could be soon solved by their policy of educating him along traditional lines. It provoked, moreover, the fiercest opposition from the misguided talented tenth of the Negroes whose lack of foresight made them the irreconcilable enemies of Booker T. Washington. The opposition of the Negro to Mr. Washington was not due so much to the work of the man himself as to the manner in which the South interpreted his educational theory. Misunderstanding the foresight of this great man, the South welcomed industrial education as an opportunity so to reconstruct the school system of the South as to make education mean one thing for the white man and another for the Negro, giving the white man the exclusive privilege of studying literature and philosophy, while the Negro should be taught to use his hands skilfully in the service of the superior class. Southern States soon ceased to appropriate money to the support of the academic education of the Negroes, diverting these funds to industrial education; and Northern philanthropists, at first adverse to this policy, yielded to it in a generation. Divested of these misconceptions and shorn of its rough edges the theory brought forward by Booker T. Washington has been accepted by the world as a great lesson for the education of all men of all conditions.

Finally, one must naturally inquire as to what all of these agencies have accomplished. They have produced the majority of our teachers of Negroes, most of their preachers, many of their physicians, dentists and pharmacists, not a few of their lawyers and a considerable number of progressive business men. They have been a decided encouragement to thrift as is attested by the Negroes' ownership of 30,000,000 acres of land, valued, together with other property, at over \$1,000,000,000, yielding the government a tax to support Negro schools and further voluntary contributions of one-half a million annually to the fund for the extension of the school term. They have taught the Negroes self-help, in that they not only assist but have been moved to take the initiative in establishing 153 schools themselves, with an annual income of \$380,933, and property valued at \$2,307,054. Above all, these institutions have reduced the illiteracy of the Negroes from 90 per cent to 30 per cent. In fact, during the last 50 years the Negro race has been actually remade by the work of these schools.

CARTER G. WOODSON,

Editor of 'The Quarterly Journal of Negro Life and History.'

NEGRO EXODUS, in American history, a term applied to the emigration of Southern Negroes to the West and Southwest in 1879 and 1880. During these years upward of 50,000 negroes, men, women and children, moved to Kansas, and as many more were scattered among the other Western States. So many of the emigrants were penniless and destitute that a Freedmen's Relief Association was organized among the citizens of Kansas. The movement proved so disastrous that emigration ceased at the close of 1880. The Negroes undoubtedly removed to the West to better their condition, but the charge was openly made that the movement originated with the Republican party, in order to ensure the election of Republican presidential electors in doubtful States. The Nashville Colored Convention (1879) endorsed the emigration, on the ground that the blacks suffered many disadvantages, both political and social, in the South. Consult articles by Greener, R. T., and Douglass, F., in *Journal of Social Science* (Vol. XI, Boston 1888), and Runnion, 'The Negro Exodus' (in *Atlantic Monthly*, Vol. XLIV, Boston 1879).

NEGRO FREE STATE. See LIBERIA.

NEGRO MELODIES. In slavery days the Southern negroes were noted for their field and cabin songs and dances. Many of their original plantation songs had been handed down from their African ancestors. The tunes, while melodious, had a range of a few notes, the major key predominating. They consist of a half recitative, half musical song, marked by a regular tempo. Accents and chords are introduced, producing in many instances original and strikingly harmonious effects. Following the ances-

tral melodies came the tunes adapted from Baptist and Methodist hymns. After the war the Negro songs began to disappear and nondescript Afric-European melodies, which eventually developed into ragtime, became popular in both the North and South. This change was due to two causes: the desire of the freed slaves to throw aside all remembrance of slavery days and to the widespread development of modern Negro minstrelsy. Consult Ritter, F. L., 'Music in America' (new ed., New York 1900); Edwards, C. L., 'Bahama Songs and Stories' (ib. 1895); Marsh, J. B. T., 'The Story of the Jubilee Singers and their Songs' (Boston 1880); Krehbiel, H. E., 'Afro-American Folk Songs' (New York 1913).

NEGRO MINSTRELS, a species of musical entertainment of a quaint and simple kind, which originated among the negroes of the southern United States, and was first made popular at public entertainments by E. P. Christy, the originator of the troupes of imitation Negro musicians. The words of the songs are generally in broken English and the harmonies almost entirely limited to the chords of the tonic and dominant. The bones and banjo and tambourine are the chief accompanying instruments, but minstrel troupes are usually accompanied by orchestras. Their entertainments are not now exclusively musical, but include amusing interludes, dramatic sketches, dancing, acrobatic and similar performances.

NEGRO MONKEY, the name of several monkeys noted for the blackness of their coats; especially a large long-tailed East Indian and Malayan langur (*Semnopithecus maurus*), which is reddish when young.

NEGRO PLOT, in American history, the name given to a local rebellion in New York City in 1741. On 18 March of that year a fire occurred in the chapel and barracks at Fort George at the Battery. It was generally believed to be accidental, but charges were set afloat that it arose from a plot by the Negroes to burn the city. Eight other fires of a mysterious nature within a month strengthened this belief, and later one Mary Burton, a servant, furnished testimony implicating a number of sailors and Negroes. Twenty-four whites and 154 Negro slaves were seized and imprisoned. Finally Mary Burton's accusations inculpated persons of prominence known to be innocent, the delusion instantly abated and the prisons were cleared of victims. It was charged that the Spanish were inciting plots among the Negroes through Roman Catholic priests. Four whites were hanged, 18 Negroes hanged, 14 burned at the stake and 71 transported. The Negroes had no counsel and were executed on insufficient evidence. Many confessed to save their lives and accused others.

NEGRO (nā'grō) **RIO**. See **RIO NEGRO**.

NEGRO SUFFRAGE. See **ALIENS**; **ELECTORAL QUALIFICATIONS**; **WOMAN SUFFRAGE**; **ELECTIONS**; **NATURALIZATION**; **VOTES**, **VOTERS**, **VOTING**; **UNITED STATES — SUFFRAGE**.

NEGROPONT, nē'grō-pōnt. See **EUBŒA**.

NEGROS, nā'grōs, Philippines, an island lying southeast of Panay, west of Cebu, and northwest of Mindanao, bounded on the north by the Visayan Sea, and on the south by the

Sulu Sea; length, 134 miles; greatest width, 33 miles; area, 4,839 square miles, with dependent islands, 4,994 square miles. It is the fourth island in size of the archipelago.

Topography.—A central mountain range, which divides the island into two almost equal divisions, extends from the extreme northern point to Caladías, only 14 miles from the southern coast; the spurs from this range extending east and west form large valleys. Near the northern end of the range is the Canlaón volcano, also known as Malaspina, 8,192 feet in height; and in the southern summits of the Sierra Dumaguete are two mountain lakes the larger five miles long, the smaller two miles. A few miles southeast of the larger lake are the hot springs of Mainit, and near the coast near Dauén are several sulphur and thermal springs. There are no large rivers, but numerous small streams flowing through the valleys.

Industrial Resources.—The soil is fertile and the vegetable products abundant; they include chocolate of excellent quality, sugar, coffee, rice, tobacco, wheat, cotton, hemp, corn, etc. There are also valuable forests in the interior. Important deposits of coal are found in both eastern and western Negros, and indications of iron in the western part. The most important industry of the island is agriculture; the natives understand methods of irrigation, and use the numerous streams for this purpose; next in importance are the fisheries; turtle shells, sea cucumbers and sea shells are also gathered. Sugar and sugar sacks are manufactured, hydraulic machinery being used in the production of the former; in the eastern part of the island cotton pillows are manufactured, which are used on steamers. A wagon road or trail follows the coast, but there are few roads extending far into the interior; there are only two defiles through the mountain range. All the important towns are on the seacoast and most of the local trade is carried on by water.

People and Government.—The people of the coast are Visayans, and those of the mountains Panayanos; the chief language is Visayan. The island was occupied by United States troops in 1900, and operations were carried on against bands of outlaws and robbers. In 1899 a native constitutional convention was held at Bacólod, and a constitution framed and submitted to the United States authorities, this being the first attempt to institute civil government in the Philippines. A temporary government was proclaimed in July 1899, and in 1901 the Philippine Commission divided the island into two provinces, Negros Occidental (western), whose capital is at Bacólod and Negros Oriental (eastern), whose capital is at Dumaguete, and established civil government similar to that in other provinces. Pop. 460,000. Consult 'Apuntes de la Isla de Negros' (Milan 1894).

NEGRUZZI, nā-groot'sē, Jacob, Rumanian author, son of Konstantin Negruzzi (q.v.): b. Jassy, 11 Jan. 1843. He published his father's complete works; was professor of commercial law at Jassy and after 1885 at Bucharest; founded in 1867 the periodical called *Convorbiri literare* for which he wrote verse, fiction and prose idylls; and translated Schiller into Rumanian. His collected works were published at Bucharest (6 vols., 1894-96).

NEGRUZZI, Konstantin, Rumanian poet and author: b. Jassy, 1809; d. there, 1866. He studied in Jassy and Bessarabia, edited *Dacia Literaria* (1840) with Cogalniceanu and Alecsandri, was a leader in the Liberal party and a minister of Count Cusa, and wrote versions of Pushkin, Kantemir and Hugo: 'The Sins of Youth,' a volume in prose and verse; and the epics 'Aprodul Purice' and 'Lapusneanu.' His complete works were published in 1873.

NEGUNDO, a genus of trees of the maple-family, represented by the box-elder (q.v.).

NEGUS, a beverage made of wine, water, sugar, nutmeg and lemon-juice: so called from Col. Francis Negus, the inventor, who lived in the time of Queen Anne. Negus is also the native title bestowed upon the sovereign of Abyssinia.

NEHALLENIA, in Scandinavian and early Germanic mythology, a goddess who presides over commerce and navigation. She is represented in paintings and sculptures with a branch of fruit and at times with an oar in her hand.

NEHEMIAH (Heb. "the comfort of Yahwe"). A Jewish statesman, holding a position of honor at the court of Artaxerxes I Longimanus (465-425 B.C.) and acting as governor of Judæa for some time during the reign of this king. Our knowledge concerning him is derived wholly from the parts of his memoirs incorporated in the work of the Chronicler. (See **NEHEMIAH**, BOOK OF). The author of Ecclesiasticus xlix, 13, who praises Nehemiah as the restorer of the walls of Jerusalem obviously had no other source and the story in 2 Maccabees i, 18ff, of the restoration of the holy fire, at the command of Nehemiah, by means of a thick liquid called *nephthar*, found in the place where the fire had been hidden, is not likely to have been taken from a lost part of the Memoirs or any other reliable document. His father's name seems to have been Hachaliah or Hakkelliah ("wait for Yahwe"). It has been maintained by Eusebius, Isidore, Générard, Scaliger, Calmet, Carrières and many other scholars that he was a descendant of the old royal family, and this would account for his position as cupbearer which was ordinarily given to persons of distinguished lineage, his allusions to the sins of the house of his fathers (i, 6) and the house or the city of the graves of his fathers (ii, 3, 5), the reason he assigns for not hiding himself in the temple (vi, 11) and the suspicion of his enemies that he had set up prophets to proclaim concerning him in Jerusalem "there is a king in Judah" (vi, 7). But if this were the case it would be strange that his genealogy is not carried back further than to his father, unless indeed it was purposely abbreviated. There is no ground for believing that he was a Levite, as Malvenda, Estius, Cornelius a Lapide, Menochi, Dupin and others have supposed. The Latin Vulgate in 2 Maccabees i, 18, may be interpreted as ascribing to him priestly functions, but not the Greek text. From his own statement we learn that he was cupbearer to King Artaxerxes. Since three Achæmenian rulers bore this name, the text does not render it certain which of them is intended. Van Hoonacker and others were, therefore, free to suppose

that Artaxerxes II Mnemon (404-359 B.C.) may have been Nehemiah's patron. The statement of Ktesias that the butler's office was given to eunuchs, consequently to foreigners, in the time of Mnemon, while in earlier times it was an honor accorded to Persian nobles, seemed to support this view, though the possibility of an occasional exception to the rule must be granted. But the Aramaic papyri found in the archives of the Jewish military colony on the island of Elephantine, which mention the sons of Sanballat in Samaria as early as in 408 B.C., have rendered it exceedingly probable that the reference is to Artaxerxes I. It would then be in the year 445 B.C. that he received his appointment as *pecha*, or governor, in Jerusalem. The occasion for his request to be given this position was a visit by his brother Hanani and some men of Judah. There is no reason for doubting that Hanani was literally a brother of Nehemiah. Batten has plausibly suggested that he only introduced the little company that had recently come from Jerusalem and acted as their spokesman. The conversation between the two brothers is significant. Nehemiah asks "concerning the Jews who had escaped, remaining behind when the exiles were carried away" and Hanani answers that "the survivors left in the province after the exile are in a miserable plight and objects of reproach, seeing that the walls of Jerusalem are broken down and the gates are gone, having been destroyed by fire." Neither Nehemiah nor Hanani knows of any other Jewish community in Judæa than that remaining in the land after the catastrophe in 586 B.C. It has been urged by many scholars that some more recent destruction of the walls must have been meant, partly on the ground of the Aramaic documents in Ezra iv, partly because Nehemiah cannot be thought to have been so greatly excited over the well-known destruction wrought by Nebuchadnezzar more than a century and a half before his time. But whatever may be the conclusion as regards the historic character of Rehum's letter and the answer by Artaxerxes, these documents have nothing to say about a violent destruction of already completed walls. Concerning such an event history is absolutely silent. Nor is there any cause for astonishment in the fact that the descriptions given by the men of Judah brought home very vividly to the prosperous Jewish official in Susa the condition of the city of his fathers, that the thought of the ancestral graves occasioned an outburst of intense grief and that the idea came to him of using the favor he enjoyed with the king to secure permission to repair the walls. It is difficult to see how this request could have been granted without any allusion either by Nehemiah or the king to a rebuilding of the walls by "men coming from Artaxerxes," subsequently stopped by royal decree in view of the past history of Jerusalem, or the destruction of them that has been conjectured, if such things had actually occurred and were in fresh memory.

Having obtained leave of absence for a time and letters to the governors of Trans-Euphratene and the keeper of the king's forest, Nehemiah set out with a military escort. Upon his arrival in Jerusalem he personally inspected the wall, and the account of his famous night-ride

is of great topographical value. He then revealed his project to the priests and the nobles. As soon as the work began, however, difficulties arose. Opponents appeared. Among them was Sanballat, the Horonite, probably governor of Samaria. It is not certain what his birthplace was. His name does not necessarily indicate that he was of a Babylonian family. In the Chaldean and Persian periods, names of this type naturally found their way into Judæa and Samaria. He maintained close relations with the high-priestly family in Jerusalem, and married one of his daughters to a son of Jehoiada, the son of Eliashib. This Sanballat should probably be distinguished from the governor of Samaria by the same name who, according to Josephus, 'Antiquities,' xi, 302 ff., secured from Alexander permission to build a temple on Gerizim and installed his son-in-law Manasseh as high-priest. There was also Tobiah, "the Ammonite slave," possibly a freedman who had risen to an influential position, and Gashmu or Gushamu, the Arab, either a Nabataean from Idumæa or a descendant of the exiles deported from Hejaz to Samaria by Sargon. These men may have been officials under Sanballat. There is no intimation that they ever sent any troops against Jerusalem, or attempted forcibly to interrupt the work. But Nehemiah feared an attack and took all possible precautions against a surprise. He declined the request for an interview with Sanballat and Gashmu at Chephira in the valley of Ono, near Lydda. It is not impossible that they sincerely believed that Nehemiah planned to make Jerusalem independent and himself favored the prophetic enthusiasm that gathered about his name, and therefore sought to make a deal with him. Nehemiah, however, felt sure that they meant to do him mischief. One cannot quite escape the impression that the doughty leader had many admirers among the prophets. It is altogether probable that some of them were hailing him as the coming king of Judæa. One of their number, Shemaiah, whom he consulted in his house, seems to have feared for his life and gave him an oracle advising him to seek refuge in the sanctuary. But Nehemiah's suspicions were aroused, and he finally charged the prophet, who may have been altogether friendly, with an attempt to ruin him. There was apparently no love lost between him and the priestly class. They may have had no objections to the reparation of the walls, and may even have lent a hand in this undertaking. But the presence of a strong representative of the Persian government, though of their race, could not be favorable to their ambitions. Another source of internal dissension was the condition of the laboring people. A levy of peasants had been drafted for the work. Leaving their farms and finding the food supply in the city insufficient, they were facing starvation with their families. The prevailing distress gave the rich Jew an opportunity for profitable business. He was willing to take mortgage on farms and vineyards for ready cash that vanished quickly in a time of famine prices. But as he favored punctuality in the payment of all obligations, sons and daughters had to be sold into slavery. Deprived of his land, without bread for hungry mouths, pitted between money-lender and tax-gatherer, the poor farmer complained that

Jewish brethren, men of the same faith, should be his oppressors. Nehemiah finally called the aristocracy together, inquiring of them if they really demanded payment of debts at such a time, and at a general meeting finely contrasted the readiness of the Jews in Persia to buy the freedom of those who were unfortunate enough to become slaves in heathen households and his own disinterested services to the community with the cruel selfishness of the capitalists in Jerusalem. Several well-to-do-citizens promised that the farmers would have the use of their fields and vineyards, and that they would not demand payment of interest for the time being. How well they kept their pledge we do not know; it is a relief not to be told. Nehemiah expresses the hope that God may not forget how good he has been himself. After 52 days of work, if the text is correct, the reparation of the wall was completed. According to v, 14, he remained as governor until the 32d year of Artaxerxes (433 B.C.). His characterization of the former governors (v, 15), and his complete silence concerning Ezra, render it extremely difficult to accept the view, widely held among critics, that he was immediately preceded by Ezra who is thought to have arrived in 458 B.C. with a large company of exiles and a firman giving him extensive powers. Van Hoonacker's suggestion that Ezra arrived in Jerusalem after Nehemiah has been adopted by Lagrange, Schmidt, Wellhausen and Cheyne. Torrey considers Ezra as a wholly fictitious character created by the Chronicler. Wellhausen and Cheyne assumed that in Ezra vii, 8 the original text had some other figure than seven, possibly 27, so that Ezra's mission would perchance fall in 438 B.C.; but this is not very likely and has no manuscript authority. In the light of the Elephantine papyri, it appears most probable that Ezra left Babylonia in the seventh year of Artaxerxes II Mnemon (397 B.C.). Nehemiah's name did not originally occur in Nehemiah viii, 9, as it is not found in the earliest Greek version, 3 Esdras ix, 49.

Some time after his return to Susa, Nehemiah found it possible to go back once more to Jerusalem. On this occasion he discovered that a large hall in the temple, formerly used for storing the gifts intended for Levites, singers and doorkeepers, had been furnished as a guest-chamber for Tobiah, and that these subordinate officials, not receiving any share of the revenues, had retired to their farms in the country. He had Tobiah's furniture thrown out, re-established the Levites and provided for their support. He put a stop to the desecration of the Sabbath, and especially the selling of dry fish by Tyrian merchants on that day. When he found children who spoke the Ashdodite dialect of their mothers, he cursed their fathers, beat them, plucked off their hair and made them swear not to marry their sons and daughters to foreigners. It is possible that Nehemiah originally followed xiii and gives a list of those who took an oath in reference to this and some other matters. He also chased away the son of Joiada who had married the daughter of Sanballat. But he did not force the men to drive away their foreign wives and children, as Ezra subsequently seems to have done. The individuality of Nehemiah is so marked that it is comparatively easy to eliminate

the subjective element in his narrative and to form an independent judgment of the men and occurrences he so graphically depicts. He had the virtues and defects of the man of affairs, the practical politician. He knew his ends and worked for them indefatigably. He was bold, enterprising, cautious, circumspect and shrewd. He had a sense of justice and sympathy with the oppressed of his own people. He flattered himself with knowing men, was inclined to read their characters through his suspicions and manifestly took some pride in his ability to escape their wiles. He felt in all sincerity that he was a pious man, and looked with some anxiety for the reward. He had convictions, and was faithful to them. But he was not an idealist like the prophets who scorned dependence on military strength and would have no walls to the city where Yahwe dwelt, or looked with disapproval upon sacrifices, holy days and petty national exclusiveness, dreaming of an Israel that should through its sufferings and its knowledge become a light to the nations. Nehemiah thought he knew the value of walls and gates, and was armed day and night; the temple cult, the Sabbath, circumcision and the separation of the chosen seed were to him of great importance. He was conscious of his merits and recorded them in order that Yahwe might remember what he had done for Israel. The walls he built seemed to have become, as Sanballat surmised, a means of developing independence and stirring up revolt. If there was a revolt under Ochus, bringing on a "third captivity," it was no doubt due to the confidence they gave. Two centuries later Sabbath observance had taken such root in the national life that Judæan peasants were willing to be slain rather than to take up arms on the sacred day. The language in which Nehemiah wrote continued to be cultivated in spite of Aramaic, Arabic and European tongues. The particularism he helped to foster made and unmade Judaism. But the love he bore for Jerusalem inspired a devotion that caused poets to sing, martyrs to confess, patriots to die and one of the great religions of the world to live.

NATHANIEL SCHMIDT,
Professor of Semitic Languages and Literatures, Cornell University.

NEHEMIAH, Book of. One of the canonical books of the Old Testament. In Hebrew manuscripts and early printed editions it forms a part of the book of Esra, and in the Greek Bible it also appears as the second part of Esdras B. Esra-Nehemiah in the Hebrew Bible precedes Chronicles; in the Greek Bible, its daughter-version and the modern translations this order is reversed, and the repetition of 2 Chron. xxxvi, 22-23 in Esra i, 1-3a by dittography renders it probable that this was the original sequence. Esra was clearly grouped by Josephus among the prophets; the reduction of the canon did not lead to the complete rejection of the book that bore his name, but only relegated it to the miscellaneous writings, while the importance still attached to him may have caused the transposition. Some manuscripts of the Latin Bible continued to treat Esra and Nehemiah as one book; in the majority they were separated as 1 Esdras and 2 Esdras, and the later printed editions of the Hebrew text adopted the current distinction between Esra and Nehemiah. In most of the Greek manuscripts Esdras B is preceded by another book called Esdras A, and this is also found in the Old Latin, the Hexaplaric Syriac, the Ethiopic and the Armenian. Its position, exclusive use by Josephus and frequent employment by Greek and Latin fathers indicate the authority it once enjoyed. Aside from some interpolations it is manifestly another translation of the Hebrew and Aramaic text of Esra-Nehemiah, differing chiefly in the transposition of some chapters and the loss of others. The most important departure from the Hebrew Esra is found in the fact that Nehemiah vii, 73-viii, 13a immediately follows Esra x, 44. Already Grotius, Whiston, Ewald and Lagarde maintained that the earliest Greek version has been preserved in Esdras A, and this view has been reaffirmed with weighty reasons by Howorth, Torrey and other scholars more recently. It has long been felt that the correspondence with Artaxerxes (Esra iv, 6-23) in the Masoretic text is out of place and has a more suitable position in Esdras A, as well as that the story of the reading of the law (Nehemiah vii, 73-ix, 37) in reality belongs to the book of Esra. As Esdras A ends in the midst of Nehemiah viii, 13, it is a matter of conjecture how much of what follows this verse preceded Nehemiah i, 1. Bertholet plausibly argues that the list of those who entered into an agreement and the pledge they gave not to marry foreign women, to keep the sabbath, to allow the land to rest in the seventh year, to pay tithes and to institute certain reforms (Nehemiah x) originally had a place after the reference to this pledge in Nehemiah xiii. If Esdras A represents the Old Greek version Esdras B is likely to represent Theodotion's recension, so that the case is similar to that of the book of Daniel.

It is generally recognized to-day that Chronicles-Esra-Nehemiah once formed a single work. The unity of these books seems to have been assumed already in the Babylonian Tal-

mud which declares: "Ezra wrote his book and the genealogy of Chronicles so far as to himself" ('Baba bathra,' 15a). This statement affirms the authorship of Ezra, but apparently intimates that there are interpolations in some passages, continuing the genealogies down to a later time. That Ezra was the author of the whole work remained the opinion of the mediæval Jewish interpreters. The position of Chronicles in the Greek and Latin Bibles and the separation of Ezra and Nehemiah tended to obscure the unity and lead to the assumption that there were three distinct authors. Spinoza rejected the Ezranic authorship, but felt so strongly that Ezra and Nehemiah (and also Daniel and Esther) were pervaded by the same spirit and showed signs of a later age that he ascribed them to a writer in the Maccabæan period, while it is not clear whether he also assigned to him Chronicles. His opinion was followed by Le Clerc in 1685. Some of the evidences that seemed to point to such a conclusion were at an early time regarded by scholars as interpolations. Thus Nehemiah vii, 1-26 was explained by de Vence as having been composed by Simon the Just or some other inspired writer later than the time of Ezra and Nehemiah. The fact that genealogies are brought down to the days of Alexander the Great, and in some versions even further, had to be accounted for. But the more thoroughly these books were studied, which had been so much neglected in earlier times that we have not a single patristic commentary, the more evident it became that as a whole they come, not from Ezra, but from the Chronicler whose hand is visible in all parts. Yet it is equally clear that this author copied extensively from already extant works. As he used the books of Samuel and Kings, and possibly other sources, in Chronicles, so he likewise made long extracts from various documents in Ezra and Nehemiah. Particularly is it obvious that he availed himself of memoirs written by Nehemiah. Spinoza's suspicion that these are fictitious was apparently aroused by the high-priestly line being carried down to Jaddua and Darius the Persian in xii, 22, and the list in vii, copied from Ezra ii, whose genuineness he doubted. But when the passages are removed that can be shown not to have belonged to the memoirs, there remains a document so marked by its peculiarities of style and language, and so impressed with the stamp of a personality unique in his rugged strength and naïveté, that it cannot be the creation of the Chronicler, whose idiosyncracies are always ready to display themselves, but may with utmost confidence be ascribed to Nehemiah himself. To this document belonged chs. i, ii, iv-vii, 4, and without much doubt also xiii, 4-31. Whether any part of iii, x-xii with the long catalogues had a place in it or as an original appendix to it is difficult to determine. Even the use of the first person is not decisive in this matter. It has long been seen that vii, 73-ix, 37 cannot have belonged to it. That this section originally belonged to the book of Ezra is clear from the Greek Esdras A, where it immediately follows Ezra x, 44. Many scholars to-day believe that the list in Nehemiah vii represents a census of "the children of the province" in the time of Nehemiah. The Chronicler evidently used only a part of

Nehemiah's memoirs. The remainder is lost, probably beyond recovery. Hence our ignorance as to his administration of 12 years, after the first two months, if the statement in v, 14 is accurately quoted from the memoirs, the possible disturbances during this period that may have left an echo in Ezra iv, the reason for his return to Susa and the date of his second mission to Jerusalem. It was probably after the events recorded in xiii that he wrote his account, and left in Jerusalem the copy which possibly the Chronicler used, perhaps two centuries later. With this autobiographical sketch a new branch of literature appears in Jewish life. It differs in its purpose from such works as Xenophon's 'Anabasis' and Cæsar's 'Commentaries.' Nehemiah does not seem to have written his narrative so much with a view to its effect upon his contemporaries, though he may to some extent have had in mind a defense of his administration against misrepresentations, as rather to set forth his deeds in a record that would remind Yahwe of the services he had rendered to his people. It is the memorial of a piety that is conscious of its worth and looks for its reward. Historically the memoirs are of very great value. They are written in a sober, orderly, matter-of-fact manner. Nehemiah informs his readers when the events took place. He describes the occasion that led him to request the privilege of visiting Jerusalem. He indicates what authority was given him. Very vividly he details the work done by him in rebuilding the wall, the opposition from without, the disturbing factors within, the successful completion of the task. Then he relates the story of his return, the ejection of Tobia and the restoration of the Levites, the enforcement of the sabbath laws, his indignation against the men who had married foreign wives, the expulsion of Jehoiada's son and the purpose of his writing. His very peculiarities reveal a character that vouches for the substantial accuracy of what he relates. Such a man as he cannot imagine facts, though he may be fanciful in the interpretation of them. We may differ from him in our judgment, but we can depend on it that what so deeply stirs his righteous wrath is not a creation of his own brain, but a stubborn external reality. It is not his fault, but due to excision of a part of his text, insertion of foreign material and a long process of editing, that we are still ignorant in regard to many things of which we would probably have first hand information if the complete work had been preserved.

Bibliography.—Commentaries by Beda Venerabilis, Saadia, Rashi, Ibn Ezra, Nicolaus Lyranus, Joseph ben Jahiah, Cajetan, Striegel, Sa, Mariana, Menochius, Munster, Vatablus, Sanctius, Crommius, Grotius, Clericus, Calmet, C. NATHANIEL SCHMIDT,
Professor of Semitic Languages and Literatures, Cornell University.

NEHLIG, nā-lēg, Victor, French painter: b. Paris, 1830; d. about 1910. He came to the United States in 1856, after learning his art under Cogniet and Abel de Pujol, and opened a studio in New York, where he was made a member of the National Academy (1870). Since 1872 he resided in Paris. He was a very successful painter of history and genre, and among his best-known pictures are 'The Bravo' (1870); 'Armorer of the Old Time'; 'Gertrude of Wyoming'; 'The Artist's Dream'; 'The Cavalry Charge of Lieutenant Hidden' (New York Historical Society); 'Battle of Antietam' (William Astor collection).

NEIDHART VON REUENTHAL, nīt'härt fōn roi'-ēn-tāl, German poet of the 13th century. A Bavarian and a poor noble by birth he is famous for his peasant lyrics, satiric and unflattering in tone, which created a new style of "court-poetry." Neidhart was a favorite of Frederick the Quarrelsome (after breaking with Leopold VII of Austria), with whom he went on the Egyptian Crusade of 1218-19. He died between 1240 and 1245, heartily hated by the peasants he ridiculed, who styled him "Neidhart Fuchs." His poems were edited by Haup (1858). A manuscript collection was made by Benecke (in Vol. II of 'Beiträge zur Kenntnis der altdutschen Sprache,' Göttingen 1832). Consult von Liliencron, 'Über Neidharts höfische Dorfpoesie' (in *Zeitschrift für deutsches Altertum*, Vol. VI, Leipzig 1848); Bielschowsky, 'Leben und Dichten Neidharts von Reuenthal' (Berlin 1891); Pfeiffer, 'Die dichterische Persönlichkeit Neidharts' (Paderborn 1903).

NEIGHBORS, Robert S., American pioneer and Indian service official: b. Virginia, 3 Nov. 1815; d. 13 Sept. 1859. Left an orphan in his youth, he drifted to the Southwest at the age of 19 and was living in Louisiana when the tidings of the fall of the Alamo appealed to his spirit of adventure and he went to Texas as a volunteer in the struggle of that commonwealth for independence from Mexico. He participated in the battle of San Jacinto and, after the end of the Texas Revolution, served with the Texas Rangers. He was a member of Kendall's Santa Fe Expedition, in 1839, and with his comrades was taken as a prisoner to the City of Mexico, where he was held a year before being released. Shortly after his return to his home at San Antonio, the Mexican general, Woll, invaded that place. Neighbors, who

was acting as clerk of the District Court (which was then in session) was captured and, with the other court officials and citizens, was carried to the Castle Perote, in September 1842, and was imprisoned until March 1844, when they were released at the urgent insistence of Gen. Waddy Thompson, the American Minister. Early in 1845 he was appointed as the agent of the Republic of Texas for the Toncawia (Tonkawa) and Lipan tribes of Indians, a position which he filled to the satisfaction of his superiors as well as to the people of the two tribes. He assisted the United States treaty commissioners (Pierce M. Butler and M. G. Lewis) in negotiating the treaty with the Comanche and other Indian tribes on the Brazos, in 1846, and was one of the agents selected to accompany the delegation of chiefs which went from that important council on a visit to Washington. After his return from Washington he was appointed as special agent for the Indians of the tribes living in Texas, and filled the place acceptably until superseded by a partisan appointee of the Taylor administration, in 1849. He then served as a commissioner of the State of Texas for the organization of El Paso County, in the performance of which duty great tact and firmness were needed as most of the residents of that section had been Mexican citizens and, consequently, hostile to Texas until a short time before. He was then elected to membership in the lower house of the fourth Texas legislature, where he served as chairman of the committee on Indian affairs. In 1853 he was reappointed as supervising agent for the Indian tribes living at Texas and the following year aided Capt. R. B. Marcy in selecting two reservations on the Brazos River, upon which all Indians in Texas were to be settled. The dismissal of a jealous-hearted subordinate was followed by a deliberate and systematically directed endeavor to prejudice and inflame the minds of the inhabitants of neighboring counties against the Indians living on the Brazos reservations. Violence followed and the protection of United States troops had to be invoked to prevent the wanton extermination of the people of the several fragmentary tribes. Throughout this crisis, Agent Neighbors was zealous and efficient in the discharge of his duty and, in consequence, he incurred the increased hatred of a baffled malevolence which plotted his destruction. Having aided most effectively in the transfer of the Indians of the Brazos reservations to a new reservation on the Washita, in the Indian Territory, he returned to Texas and, though warned that his life was in danger, walked unafraid into a settlement where cowardly assassins were thirsting for revenge because their wicked plots had been frustrated. There he was shot down, by a man to whom he was an entire stranger, and died a few minutes later, 13 Sept. 1859. He was a man of discernment and intelligence as well as great courage. He was quoted as an authority in matters pertaining to the Comanche Indians by Schoolcraft in 'History of North American Indians.' Consult 'Letter of Major [afterward General] George H. Thomas, 2d U. S. Cavalry' in Annual Report of the Secretary of War, 1859; 'Annual Report of the Commissioner of Indian Affairs for 1859,' pp. 220-334.

NEILGHERRY (nēl-gēr'ē) **HILLS.** See NILGIRI HILLS.

NEILL, Charles P., American educator and statistician: b. Rock Island, Ill., 12 Dec. 1865. At an early date his parents moved to Texas and he found employment in a bank in Austin. He began his college studies at Notre Dame University, but later went to Georgetown University, whence he was graduated in 1891 *summa cum laude*, the second student in 50 years to be so honored by that university. After graduating he returned to Notre Dame as instructor for three years, and then entered Johns Hopkins University, in Baltimore, for post-graduate work in economics and history, meanwhile teaching in the Catholic University at Washington. In 1897 Johns Hopkins conferred the degree of Ph.D. on him, and from then until 1905 he was the head of the department of economics in the Catholic University. He was assistant recorder for the Anthracite Coal Strike Commission under Carroll D. Wright, and recorder for the Alabama Coal Strike Commission under Judge Gray. He was vice-president of the Board of Charities and Corrections of the District of Columbia, and in March 1905 was appointed Commissioner of Labor by President Roosevelt. Remained as Commissioner of Labor under President Taft and was reappointed by President Wilson. Resigned this position in 1913 to organize a labor and welfare department for the American Smelting and Refining Company, at New York City. Remained in that work until 1915, when he returned to Washington to organize a bureau of information for the Southeastern Railways.

NEILL, nēl, Edward Duffield, American historian and educator; b. Philadelphia, 9 Aug. 1823; d. 26 Sept. 1893. He was graduated from Amherst in 1842, and later studied at the Andover Theological Seminary. In 1848, having entered the Presbyterian ministry, he was settled as pastor of the first Protestant church established at Saint Paul, Minn. He served (1851-53) as superintendent of public instruction for that territory, and as chancellor of the State University, 1858-61. As army and hospital chaplain he served in the Civil War from 1861 to 1864, then till 1869 was an assistant private secretary, first to President Lincoln, and afterward to President Johnson. In 1869 he was for a short time consul at Dublin. He was president of Macalester College, Saint Paul, 1873-84, and professor of history and literature there from the latter year until his death. His books included 'History of Minnesota' (1858); 'Terra Mariae,' a history of early Maryland (1867); 'English Colonization of America During the Seventeenth Century' (1871); 'Minnesota Explorers and Pioneers' (1881); 'Virginia Vetusta' (1885); and 'Virginia Carolorum' (1886).

NEILSON, nēl'son, James Beaumont, Scottish inventor of the hot blast in manufacturing iron: b. Shettleston, near Glasgow, 22 June 1792; d. Queenshill, Kircudbrightshire, 18 Jan. 1865. His father was a millwright, too poor to give his son much education. The latter worked at engines as a boy, acquired a little money by marriage, and in Glasgow at 25 became foreman of the new gasworks, in connec-

tion with which he opened a library, reading-room and lecture hall for the employees. His experiments with the hot blast date from about 1825; they were contrary to the theory of the ironmasters of the time who saw that the iron was more easily worked and better in winter and so attempted artificial refrigeration. The result, of course, was that no one would let Neilson use his blast furnace for a decisive test for a time. The method introduced (1828) by Neilson is thrice as cheap as the cold blast; hence the patent was constantly infringed and for 15 years he was involved in exhausting lawsuits, which, with the exception of the great case against the Bairds of Gartsherrie, who refused to pay license for the hot blast, were mostly unsuccessful. In 1847 he retired to the Isle of Bute, and spent his last days at Queenshill, where he established a workingman's institute.

NEILSON, Lilian Adelaide, English actress, whose real name was Elizabeth Ann Brown: b. Leeds, 3 March 1848; d. Paris, 15 Aug. 1880. She worked in a mill at Guiseley and then as a nursemaid, and, upon learning the story of her birth, ran away from her mother, an actress, and went to London. There she was a bar-maid; was educated for the stage through the efforts of a chance acquaintance; gave dramatic recitations from Shakespeare; and made her début in 1865 as Juliet, possibly her best rôle. She played for several years in London with great success due to her beauty, her girlish grace, splendid voice and dramatic power, and appeared in New York in 1872. She was married to Philip Lee early in life and was divorced in 1877. Her rôles included Isabella, Julia, Rosalind, Beatrice, Lady Teazle, Amy Robsart in Andrew Halliday's 'Kenilworth,' and Rebecca in Halliday's 'Ivanhoe.' Consult Scott, 'The Drama of Yesterday and To-day' (London 1899); Winter, William, 'Other Days' (New York 1908); Marston, 'Our Recent Actors' (London 1890).

NEILSON, Samuel, Irish politician, leader of the United Irishmen: b. Ballyronney, September 1761; d. Poughkeepsie, N. Y., 29 Aug. 1803. After marrying the daughter of a rich merchant he went into the woollen business in Belfast. His part in politics became increasingly engrossing and in 1791 he suggested the organization of the United Irish Society, which was very successful, thanks to Wolf Tone. To assist this enterprise Neilson became editor of the *Northern Star*, of which he was sole proprietor in 1794, and which was suppressed in 1797 after his arrest for treason. He was released in February 1798, rearrested almost immediately and was again released in 1802. He came to America in December 1802 and died in the next year. Consult Madden, 'United Irishmen' (1842-46), and the 'Life' by Dornin (1804).

NEISSE, nīs'sē, Germany, a town in the Prussian province of Silesia and the government of Oppeln, on a river of same name, 47 miles by rail southeast of Breslau. It is a place of considerable strength, surrounded by detached forts and other works; has some notable edifices, military and other important schools, and manufactures furniture, blankets, wire-netting, tapestry, cutlery, lace, and has an ex-

tensive trade in sugar, marble, vegetables and wood. Neisse was anciently the chief town of a principality and residence of a prince-bishop. It came into the possession of Prussia in 1741, when, after a valiant defense, it was taken by Frederick II. Pop. 25,938.

NEITH, nē'ith, or **NEITHA**, in Egyptian mythology, a goddess who was worshipped especially as a local divinity in Lower Egypt. By the Greeks she was identified with Athene. She often appears as the companion of Phtha, who, as local divinity of the old capital of Memphis, stood at the head of the pantheon of Lower Egypt; and on that account she is not unfrequently styled the great Mother of the Gods. Like all the great Egyptian goddesses, she was identified with Isis. Although mentioned at an early date she does not appear prominently until the 26th Dynasty. Her representation was a crowned woman, with sceptre and bow and arrows. Consult Budge, E. A. T. W., 'The Gods of the Egyptians' (2 vols., London 1904); Flinders, Petrie, 'Nagada and Ballas' (ib. 1896); Mallet, 'Le culte de Neit à Sais' (Paris 1889); Wiedmann, Alfred, 'Religion of the Ancient Egyptians' (Eng. trans., New York 1897).

NEJD, or **NEJED**. See **NEDJED**.

NEKRASOV, nĕk-rā'sŏf, **Nikolai Alexeievitch**, Russian poet: b. Podolia, 4 Dec. 1821; d. Saint Petersburg, 8 Jan. 1878. He was educated in Saint Petersburg, where he left the army for the University against his father's wishes and was disowned by his family. By teaching and writing he made a bare livelihood. In 1847 he succeeded Bielinsky as editor of the *Contemporary*, which post he kept until 1866; and in 1868 became editor of the *Annals of the Fatherland*, in which most of his poetry appeared. He bitterly attacked administrative abuse, notably in his long poem, 'Who Lives in Russia Happily?' showing the discontent and the suffering in all classes. His satiric attacks on the bureaucracy should be mentioned and the pathetic and powerful 'Last Songs' (1877). Nekrasov's works appeared in two volumes (Saint Petersburg 1909). Consult Newmarch, Rosa, 'Poetry and Progress in Russia' (New York 1907, with translations); Wiener, 'Anthology of Russian Literature' (New York 1903); consult also the lives by Pokrovski (Moscow 1906) and Pypin (Saint Petersburg 1905).

NEKTON, nĕk'tŏn, a term used to designate such of the minute surface-life of the sea (the plankton) as is able to swim against a current instead of merely floating with it. It therefore embraces the more active, and on the whole more advanced, class of lowly marine organisms. The term was introduced by Haeckel, but is not in very common use.

NÉLATON, nā'lā-tŏn', **Auguste**, French surgeon: b. Paris, 1807; d. Paris, 1873. From 1851 to his death he was connected with the medical faculty of Paris and until 1867 was professor of clinical surgery, and the year previous he became physician to the emperor, two years later Senator and in 1869 a member of the Institute. The improvements he made in surgery gained for him an international reputation. He wrote extensively on his subject of special study, surgery, not, however, to the

neglect of other aspects of the medical question. Among his more important works are 'Recherches sur l'affection tuberculeuse des os' (1837) and 'Éléments de pathologie chirurgical' (1844-49).

NELEUS, nē'lūs, in ancient Greek mythology, a son of Poseidon and twin brother of Pelias. He was exposed but reared by a shepherd. When they were grown, their mother Tyro recognized them. The inheritance kingdom of her husband, Cretheus of Iolcus in Thessaly, caused a quarrel between the two brothers and Neleus withdrew to Pylos in Messenia. He refused to purify Hercules after the murder of Iphitus, and Hercules in vengeance killed all his sons but Nestor. It is said that he revived the Olympian games.

NELIGH, nē'lig, Neb., city, county-seat of Antelope County, on the Elkhorn River and on the Chicago and Northwestern Railroad, about 120 miles in direct line northwest of Lincoln and 150 miles in direct line northwest of Omaha. It is in a fertile agricultural section in which corn and wheat are the chief farm products. Considerable attention is given to raising cattle and hogs. It is the seat of Gates Academy, under the auspices of the Congregational Church, and has a public library, public park, bathing beach, alfalfa and flour mills, grain elevators, creamery, marble and granite works, cement-block and brick works, etc. Pop. (1920) 1,724.

NELL GWYNN. See **GWYNN**, **ELEANOR**.

NELLORE, nĕ-lŏr', or **NELLUR**, nĕ-loor', India, a town, the capital of a district of Madras, on the Pennair River, eight miles from its mouth in the Bay of Bengal, and 109 miles by rail northwest of Madras city. The principal industries are dyeing and rice-husking. Pop. 33,246. The district of Nellore, area 8,765 square miles, is famous for its breed of cattle. There is an extensive irrigation system in the district. Pop. 1,497,796.

NELSON, **Aven**, American botanist: b. Lee County, Iowa, 24 March 1859. He was graduated from the State Normal School at Kirksville, Mo., in 1883; was instructor in Drury College, Springfield, Mo., 1883-85; principal of public schools, Ferguson, Mo., 1885-87; and since 1887 professor of botany in the University of Wyoming. He received the degree of M.S. from Drury College in 1890; M.A. from Harvard, 1892; Ph.D. from the University of Denver in 1904. As experiment station botanist he has published many bulletins, among them the 'Trees of Wyoming and How to Know Them' (1899). The leading botanical journals have published from his pen several important series of papers on the plants of the West. He has published the following books: 'Key to the Rocky Mountain Flora' (1902) and a 'Spring Flora of the Inter-Mountain States' (1910; 1912). He has revised and rewritten the 'Manual of Botany of the Rocky Mountains' (1909), which was originally issued by Dr. John M. Coulter (1885). He is fellow in the section of botany, American Association for the Advancement of Science, and in the Botanical Society of America.

NELSON, **Cleland Kinloch**, American Protestant Episcopal bishop: b. near Cobham, Va., 23 May 1852; d. 13 Feb. 1917. He was

graduated from Saint John's College, Annapolis, Md., in 1872, studied theology at Berkeley Divinity School, Middletown, Conn., and was ordained to the priesthood in 1876. He was rector of the church of Saint John the Baptist at Germantown, Philadelphia, 1876-82, and of the church of the Nativity, South Bethlehem, Pa., 1882-92. In the year last named he was consecrated bishop of Georgia. He received the degree of Doctor of Divinity from Saint John's College in 1891 and from the University of the South in 1892. When on account of increasing responsibilities his jurisdiction was divided in 1907, he chose the Diocese of Atlanta, the name adopted by the new portion set off. In 1904 Bishop Nelson was elected president of the Synod of Sewanee, comprising Southern dioceses.

NELSON, Henry Loomis, American journalist: b. New York, 5 Jan. 1846; d. there, 29 Feb. 1908. After a course at Williams College, he studied law, was admitted to the bar in 1869, was Washington correspondent of the *Boston Post* in 1875-85, and editor of that journal in 1885-86. In 1894-98 he was editor-in-chief of *Harper's Weekly*, and from 1902 professor of political science in Williams College. He published 'Our Unjust Tariff Law' (1884); 'The Money We Need' (1896); 'The United States and its Trade' (1902).

NELSON, Horatio, 1st Viscount, English naval officer: b. Burnham-Thorpe, Norfolk, England, 29 Sept. 1758; d. on board the *Victory* at Trafalgar on 21 Oct. 1805. He entered the English navy at 12 (1770). Three years after he went on an Arctic expedition under Commodore Phipps and on his return (1777) was made a lieutenant. Two years later he was promoted to the rank of post-captain. He was then sent to Nicaragua in command of a man-of-war, and took Fort San Carlos, in the San Juan River. In 1781-82 he made another expedition into the North Sea, but returned to the West Indies in 1782 and, placed in command of the *Boreas*; he was kept on this duty for five years, accomplishing much good from his vigorous attempts to prevent smuggling between the United States and the British colonies. Nelson's indomitable spirit in insisting upon enforcing the Navigation Acts against all foreign nations brought him into conflict with his commander, Sir Richard Hughes, and made him unpopular in commercial circles; for a long time he was harassed with vexatious lawsuits. He was, however, upheld by the British government. It was while on this station that Nelson met and married the widow of Dr. Josiah Nesbit (11 March 1787). Six months after his marriage he returned with his wife to England and was placed upon the retired list. It has been hinted that through jealousy undue influence was brought to bear upon the Admiralty to keep him from active service. At any rate he remained in obscurity until all officers were recalled into active service on the outbreak of the war with the French Republic in 1792.

The year 1793 saw the real beginning of Nelson's career. He had attracted Lord Hood's attention, and at his solicitation was placed in command of the ship *Agamemnon*, 64 guns, and sent to join Lord Hood in the Mediterranean, where he rendered him valuable assistance at the siege of Bastia (May 1794). He partici-

pated in the siege of Calvi and there had the misfortune to lose one of his eyes. While on this station he also served under Hotham and Sir John Jervis. While on a diplomatic mission to Naples in September 1793 he met Lady Emma Hamilton, who was destined to be so closely identified with an important part of his life. In 1796 he was promoted to be commodore and was given a new command. On 25 Sept. 1796 orders came ordering the abandonment of Corsica and the Mediterranean, and Nelson sorrowfully left the field. He was, however, shortly sent back to secure supplies which had been left on the island of Elba, and on returning passed through the whole Spanish fleet which had then joined the common cause of France. On the following day occurred the famous battle of Cape Saint Vincent (q.v.), 14 Feb. 1797. For his gallantry and skill in manœuvring his vessel he was made rear-admiral of the blue and appointed to the command of the inner squadron at the blockade of Cadiz. His next service was an attack on the town of Santa Cruz, in the island of Teneriffe, in which he suffered the loss of his right arm. The wound refused to heal and he was obliged to return to England. He was decorated with the Order of the Bath by George III and at the same time awarded a pension of \$5,000. On the 29th of March 1798 he again set sail and joined the Earl of Saint Vincent (Admiral Jervis) off Cadiz 30 April. The admiral sent him to watch the progress of the armament at Toulon. Notwithstanding his vigilance, the French fleet which conveyed Bonaparte to Egypt escaped. Thither Nelson followed, and discovered the enemy's fleet moored in the Bay of Aboukir, where he obtained a complete victory, all the French ships but two being taken or destroyed (1 Aug. 1798). This achievement was rewarded with the title of Baron Nelson of the Nile and an additional pension of \$10,000. Nelson set sail from Alexandria 19 August and arrived at Naples 22 September. Here began the pitiable period of his career, which left an indelible blot upon his otherwise unblemished name. He came under the influence of Lady Hamilton, wife of the English ambassador. His criminal relations with that lady, with whom he lived openly after the death of her husband, led to his ultimate separation from his devoted wife. Her influence can be recognized in many of his public acts during the two years he spent under her spell in Naples. During this time he seemed to fall into a lethargy which for the time being made him forget his duty to Great Britain, and at one time he practically acted in the capacity of admiral of the Neapolitan navy. He did, however, really get the Neapolitans to take up arms against the French, but their army was soon subdued and the Parthenopean Republic was established by Napoleon.

Finally Nelson seemed to awake to a new sense of duty, being goaded by the appointment of a junior officer, Sir Sidney Smith, to an important command in the Levant, and also aroused by the exciting news that Admiral Bruix had escaped with the French fleet from Brest and was about to enter the Mediterranean. The imminent danger of the French regaining the naval supremacy of the Mediterranean set Nelson to work with all his old time vigor. In

the meantime Jervis had resigned his command and was succeeded by Keith, with whom he was at variance from the very start. He determined to take Naples before the possible arrival of the French, and forthwith appeared before that city 24 June 1799. Here he found Commodore Caraccioli in command of a Neapolitan squadron which was in league with the Republicans who were in complete control. The forts of the city surrendered on 26 June and then followed Nelson's worst mistake. The Neapolitan admiral was not captured till 29 June, but Nelson immediately ordered a court-martial and condemned him to death, thus violating the capitulation concluded 23 June. Caraccioli was cruelly hanged. The whole miserable affair has been attributed to the influence of Lady Hamilton, who was also the favorite of the queen of Naples. It was little honor to Nelson that the despicable king of Naples, Ferdinand IV, soon after this created him Duke of Bronte.

Nelson's flagrant disobedience of orders shortly after this is also ascribed to feminine influence. He obstinately remained at Naples when ordered to join Lord Keith, who expected to meet the French fleet. This meeting, as a matter of fact, never took place, but a great victory might have been won had Nelson's fleet put in an appearance in time. This affair had a great deal to do with his quarrels with Keith and also his subsequent orders recalling him to England. He arrived home 6 Nov. 1800, having traveled overland with the Hamiltons; soon after this the scandal of his life culminated in the final breach with his wife.

Nelson's promotion to the rank of vice-admiral was dated 1 Jan. 1801 and he was at once employed on an expedition to aid Sir Hyde Parker against the league of the Northern Confederation. This league by its policy of armed neutrality was really aiding the French Republic, and Nelson wished to strike first at Russia, but this policy was overridden, and Nelson contented himself with making a bold attack on the Danish fleet at Copenhagen. He completely annihilated the fleet and silenced the shore batteries 2 April. During the battle his attention was called to the fact that his ship had been signaled to cease firing. Placing a telescope to his blind eye he remarked: "I really cannot see the signal." This remark added to his popularity at home. For his success and gallantry upon this occasion he was created a viscount, and his honors were made hereditary in his family, even in the female line. He then took command of the squadron for defense against the contemplated French invasion of England and attacked the French flotilla off Boulogne 15 August. He then went back to Lady Hamilton in Merton Surrey and remained there during the Peace of Amiens. When hostilities recommenced after the Peace of Amiens, Lord Nelson was appointed to command the fleet in the Mediterranean, and for nearly two years was engaged in the blockade of Toulon. But in spite of his vigilance the French fleet got out of port (30 March 1805), and being joined by a Spanish squadron from Cadiz, sailed to the West Indies. The British admiral hastened to give chase and pursued them all the way to the West Indies and back again to Europe, one of the most exciting chases that ever took place in naval history. Villeneuve finally took refuge at Cadiz, but Nelson's object had been accom-

plished, for without his naval forces Napoleon could not carry out his plan of invasion and was now obliged to turn his attention to Austria, which had in the meantime declared war. Nelson now had Villeneuve in a trap, but hardly expected him to leave the harbor. The French admiral, however, learned that Napoleon was contemplating relieving him of his command because he would not fight. In despair, Villeneuve decided on desperate measures and the French and Spanish fleets sailed forth to meet the dreaded enemy, leaving the harbor 19 October, the French commanded by Villeneuve, the Spaniards by Gravina. On 21 October they came up with the British squadron off Cape Trafalgar. Then occurred the famous battle of Trafalgar, as desperate an engagement as ever took place upon the high seas. The engagement ended in a glorious victory for the British, but it cost them the greatest naval hero England ever produced. Nelson was mortally wounded early in the day and died during the afternoon. His remains were carried to England and he was buried with much pomp in Saint Paul's Cathedral 8 Jan. 1806. In Trafalgar square in 1849 a fine monument was erected to his memory.

Consult Southey, 'Life of Nelson' (1828); de Forgues, E., 'Histoire de Nelson' (1860); Jeaffreson, J. C., 'Lady Hamilton and Lord Nelson' (1888); 'The Queen of Naples and Lord Nelson' (1889); Laughton, 'Nelson' (London 1904); Mahan, 'Life of Nelson' (Boston 1899) very reliable; Russell, 'Horatio Nelson' (1899); Browne, G. L., 'The Public and Private Life of Horatio, Viscount Nelson, as Told by Himself, His Comrades, and His Friends' (London 1891); Fitchett, W. H., 'Nelson and His Captains' (ib., 1902); Laughton, J. K., 'Nelson and His Companions in Arms' (ib., 1905); White and Moorhouse, 'Nelson and the Twentieth Century' (ib., 1905); Matcham, M. E., 'The Nelsons of Burnham Thorpe' (ib., 1911); Moorhouse, E. H., 'Nelson in England: A Domestic Chronicle' (New York 1913).

NELSON, Julius, American biologist; b. Copenhagen, Denmark, 6 March 1858; d. 16 Feb. 1916. He was graduated at the University of Wisconsin in 1881 and Johns Hopkins University in 1888. He was appointed biologist of the New Jersey State Tuberculosis Commission, which post he gave up after a year. From 1889-1916 he was professor of biology at Rutgers College and chief biologist of the New Jersey agricultural experiment station. Professor Nelson was identified with the investigation of oyster culture in New Jersey, co-operating with the chief of the bureau of shell fisheries. He formerly was vice-president and consulting adviser of the Lederle Laboratories in New York.

NELSON, Knute, American legislator; b. near Bergen, Norway, 2 Feb. 1843; d. 28 April 1923. In 1849 his mother brought him to the United States. He studied at Albion Academy, and entered the Union army during the Civil War. He was wounded and captured by the Confederates at Fort Hudson, La. In 1867 he was admitted to the bar and in 1867-69 served in the Wisconsin legislature. In 1871 he removed to Alexandria, Minn., and from 1872 to 1875 was attorney of Douglas County.

In 1875-78 he was a member of the Minnesota senate and was a presidential elector in 1880. In 1882 he was elected member of Congress and was re-elected in 1884 and 1886. Although a Republican in politics, he did not follow strictly party lines and frequently asserted his independence by voting for measures proposed by members of the Democratic party. From 1886 to 1892 he was engaged in the practice of law and acquired a vast knowledge of the laws relating to public lands and land cases generally. He became governor of Minnesota in 1892 and was re-elected two years later. His administrations were deemed excellent by the people of the State and in 1895 he was sent to the United States Senate in succession to W. D. Washburn. He was elected for a full senatorial term in 1900, and was re-elected in 1906, 1912 and 1918. In the Senate Mr. Nelson introduced the bill creating the Department of Commerce and Labor.

NELSON, Samuel, American jurist: b. Hebron, N. Y., 10 Nov. 1792; d. Cooperstown, N. Y., 13 Dec. 1873. He was graduated from Middlebury College, Vermont, in 1813, and in 1817 was admitted to the bar. He soon established a reputation which gained for him a large practice and in 1823-31 he was circuit judge. In 1831 he became associate justice of the Supreme Court of New York and in 1837-45 he was chief justice. He was appointed associate justice of the Supreme Court of the United States by President Tyler in 1845 and in the famous Dred Scott case he sustained Chief Justice Taney in his decision that if Congress had authority to destroy slavery it had also power to establish it. He disapproved the intrusion of military power in what he considered civil affairs, but maintained an unquestioned loyalty during the Civil War. He was appointed by President Grant a member of the Alabama Arbitration Committee in 1871, and in 1872 he resigned from the bench.

NELSON, Thomas, American patriot: b. Yorktown, Va., 26 Dec. 1738; d. in Hanover County, Va., 4 Jan. 1789. He was the son of William Nelson, governor of Virginia 1770-71, and was educated at Eton and Trinity College, Cambridge, England. Returning to Yorktown in 1761, he was elected to the House of Burgesses, in which he served for several terms; and he also sat in the provincial conventions, 1774-75-76, in the last of which he introduced the resolution instructing the Virginia delegates in the Continental Congress to move for a declaration of independence. Later (1775-77) he was himself a delegate to the Continental Congress and was a signer of the Declaration. He resigned on account of impaired health, but was soon (August 1777) in command of the Virginia State forces, at whose head he remained until near the close of 1782. At the siege of Yorktown he ordered American gunners to fire upon his own mansion, in which Cornwallis was believed to have his headquarters. In 1779 he was again a member of Congress, and again resigned by reason of ill health. During the next year on his own security he raised public moneys for Virginia and paid certain military arrearages out of his private funds. In 1781 he became governor of the State, succeeding Thomas Jefferson, but in a few months resigned. His patriotic generos-

ity had impoverished him and he saw his property sold for payment of public debts contracted on the security he had given, while his own days ended in circumstances of privation.

NELSON, William, American sailor and soldier: b. Maysville, Ky., 1825; d. Louisville, Ky., 29 Sept. 1862. Entering the United States navy in 1840 he became lieutenant in 1855 and at the opening of the Civil War was put in command of the gunboats on the Ohio with rank of lieutenant-commander. On leaving the navy, soon after he entered the army, became a brigadier-general of volunteers and commanded the 2d division under Buell at the battle of Shiloh. In a quarrel with the Federal general, Jefferson C. Davis, he was fatally shot at the Galt House in Louisville.

NELSON, Wolfred, Canadian physician: b. Montreal, Canada, 10 July 1792; d. there, 17 June 1863. He was a surgeon in the British army in the War of 1812, but in 1837 he headed the rebellion decided upon in the meeting of the "Four Countries." He was captured and sentenced to imprisonment for life in the Bermudas, but the sentence was declared illegal and he was liberated. He lived in the United States in 1838-42, when he returned to Montreal; served in Legislative Assembly of Canada in 1844-45, and in 1851 was made inspector of prisons. He was twice chosen mayor of that city. Consult Dent, J. C., 'Canadian Portrait Gallery' (1880) and 'Canada Since the Union of 1841' (Toronto 1881).

NELSON, Canada, city and capital of Kootenay District, British Columbia, at an altitude of 1,769 feet, on the Kootenay River, of which Kootenay Lake is an expansion, and about 270 miles west of Vancouver on the Canadian Pacific and Canadian Northern railways. It is the centre of the noted Kootenay silver-mining region, and has large stamp-mills and smelters; gold, copper, lead, zinc and coal are also produced in the vicinity. There are saw mills, machine shops and boat yards. Steamships ply between Nelson and points on Kootenay Lake. The Doubhokors hold great areas in the district for fruit-growing. Pop. about 7,500.

NELSON, England, a municipal borough of Lancashire, about three miles northeast of Burnley and 30 miles north of Manchester. Among its chief municipal features are a free library, technical school and market hall; it owns also its water, gas, electric-lighting plants and baths. It is a thriving cotton, worsted and silk manufacturing centre, and coal is worked. Pop. 39,479.

NELSON, a river in Canada, the largest in the province of Manitoba. It is an outlet of Lake Winnipeg; leaving the lake at the north end, it first flows north through several lakes to Split Lake, then northeast to Hudson Bay which it enters through Port Nelson. The volume of water it discharges is very large; it is a deep, swift-flowing stream, with many rapids and cascades along its course of about 425 miles. It is navigable for boats to about 130 miles from its mouth and for about 100 miles from Lake Winnipeg.

NELSON, Life of. The 'Life of Nelson' by Robert Southey, frequently referred to as the most perfect short biography in the lan-

guage, is one of the most famous of English lives. Since its publication in 1813 it has gone through edition after edition, and there is little evidence of decline in its popularity. In the face of these facts general readers need to be warned that the 'Life' is great chiefly in the literary sense; it is not an exhaustive and authoritative historical biography. Southey did not to any great extent go to original documents for his materials. The 'Life' is an amplification of the brief sketch of Nelson with which Southey concluded a review of the lives by Charnock, Harrison, Churchill and Clarke and McArthur, in the *Quarterly Review*, February 1810. Furthermore, he was undoubtedly careless in admitting much material from sources none too reliable, and was manifestly unfair in his attitude toward the French. To quote Professor Laughton: "There is no doubt that Southey's artistic skill gave weight and currency to the falsehoods of Miss Williams, as it did to the trash of Harrison, and the wild fancies of Lady Hamilton."

The greatness of the work arises from its human interest: it is a *life* in the truest sense of the word, not a collection of dry facts. Southey was not an expert in naval matters, and fortunately so; he subordinated technical details and concentrated attention upon the plain narration of the events of Nelson's life. The sweep of the narrative, rivaled by few books of adventure, is irresistible; one does not wonder that it has long remained the favorite book of the English school boy. The style is in thorough keeping with the spirit of the narrative. Southey's style, well known as one of the best, if not the best, of English prose styles, in the 'Life of Nelson' is exhibited to greatest advantage. It is simple, pure, limpid—adequate in every way to the task in hand. The danger in writing the life of a man like Nelson is the danger of running into extravagance, of over-emphasizing, of indulging in high-flown rhetoric. This danger Southey successfully avoids. It would be difficult to find a narrative more restrained, more dignified. And the strain with which it closes is a strain in the true Greek manner. The careful student will, of course, supplement the 'Life' by readings from such recent lives of Nelson as those by W. Clark Russell and Admiral A. T. Mahan, but there is no book which can entirely take the place of Southey's great work. It is, in the words of Sir Humphrey Davy, "an immortal monument raised by genius to valor."

WALDO H. DUNN.

NELSONITE. A dike rock consisting of ilmenite or rutile and apatite occurring in Nelson County and other localities in Virginia.

NELSONVILLE, Ohio, in Athens County, on the Hocking River and on the Hocking Valley Railroad, about 60 miles southeast of Columbus. It is in the vicinity of bituminous coal fields, and has a large trade in coal. Its chief manufacturing establishments are car-wheel works, mining-implement shops, foundry and repair shops. The city owns and operates the waterworks and electric-light plant. Pop. 6,440.

NELUMBO, a genus of aquatic plants of the family *Nymphaeaceae*, containing the East Indian lotus (*N. nelumbo*) and the Egyptian lotus (*N. caerulea*). The former serves many useful purposes in the East. The filaments are

there deemed astringent and cooling and are prescribed in burns, piles and menorrhagia; the seeds are given to prevent vomiting, and to children as diuretics and refrigerants. The large leaves are made into bed sheets for fever patients; a sherbet made from the plant is given as a refrigerant in smallpox, etc. The rhizome, stalks and seeds are eaten by the Hindus, and furnish a preparation known in commerce as "Chinese arrowroot." A fibre derived from the stalk is used as a wick for lamps in Hindu temples, the plant being considered sacred. See *Lotus*.

NEMATHELMINTHES, round or thread worms, a phylum or branch of the Metazoa in which are brought together several groups having in common little more than the general external form and appearance. It is really a group of convenience, as closer study reveals such striking anatomical differences between groups that in fact their internal structure has no fundamental likenesses. In the phylum are ordinarily included three main classes: (1) Nematoda, or true roundworms; (2) Gordiacea or hairworms, and (3) Acanthocephala or proboscis roundworms. To these are often added the small and little known groups of the Gastrotricha and Chaetognatha.

All these display an elongated, approximately cylindrical form, and a monotonous exterior. The body is not divided into segments and not provided with appendages.

The Acanthocephala have a roughened surface, at times with imperfect rings, and are carrot-shaped rather than strictly cylindrical. They possess an anterior protrusible proboscis covered with rows of recurved hoods by which the worm attaches itself to the wall of the alimentary canal of the host; for they are exclusively parasitic and so highly modified for a parasitic existence that no trace of an alimentary system has been found in any stage of existence. The species are not numerous. They occur chiefly in fishes, though some species are found in reptiles and birds and a few in mammals, one (*Gigantorhynchus gigas*) being common in the pig. A few rare cases of parasitism in man are on record. The larval stages are passed in insects or worms and they attain the vertebrate or final host when the larval host is eaten. Thus during no part of the life history is the organism free living.

The Gordiacea or hairworms (q.v.) are very uniformly cylindrical with bluntly rounded ends and often slightly colored surface. During early life they are parasitic in the body cavity of insects, chiefly grasshoppers and locusts, whereas the sexually mature adult form is free living in fresh-water bodies. They are often found in large numbers in shallow water along the shores of streams and lakes.

The Nematoda (q.v.) or true roundworms usually taper somewhat toward one or both ends so that they are spindle-shaped rather than cylindrical and at least one end is sharp-pointed. The external surface is colorless, glistening and smooth, though often marked by delicate circular striations. Many species are minute and live free in water, mud and soil. To the latter which are found in incredible numbers is ascribed an important rôle in the formation of fertile soils. The parasitic species are more varied in form and usually larger than the free-living types; they pass commonly some stage

of their life history in the outer world during the period of transfer from one host to another. These free living larval stages resemble closely in size and structure the true free living species.

The Gastrotricha are minute free-living forms that occur among plants or in the mud of the shore or bottom. Most species are fresh-water inhabitants though some are found in the sea. They are not abundant or easily found and are relatively little known.

The Chaetognatha or arrow worms are found in enormous numbers in the surface regions of the open ocean. Their marked transparency and delicate structure make them objects of great beauty under the microscope. Because of their development and of their apparent metameric structure they are now more frequently associated with the annelids or near them rather than with the roundworms as formerly.

HENRY B. WARD.

NEMATOCYSTS (Greek *νημα*, thread, *κύστις*, bag, cell), peculiar structures occurring in the *Cœlenterata* (q.v.) and in a few members of other groups of animals (*Turbellaria*, *Nemertinea*, and possibly *Protozoa*) which serve as weapons of offense and defense. They are formed within specialized epidermal cells known as cnidoblasts. In structure a nematocyst is a cell one end of which is drawn out into a long tube, the thread, which is inverted

Two nematocysts; one entire, the other exploded.

into the body of the cell as the finger of a glove, may be turned into the palm. Connected with the cell is a hair-like structure, the cnidocil, and when this is touched the nematocyst "explodes." The thread is forced out, carrying with it the fluid contents of the cell, which in its physiological action is much like formic acid. This is sufficient to kill small animals, to paralyze those of larger size. Some *Cœlenterates*, like the Portuguese man-of-war, have nematocysts which can produce very disagreeable effects on man. Once exploded, a nematocyst cannot in general be used again. New nematocysts are continually being formed. The layer which gives rise to them is not in all cases ascertained. From their structure and action nematocysts are also known as thread cells, nettle cells and cnidæ.

NEMATODA, or true roundworms, a large rather uniform group of animals containing both free and parasitic species. They are slender and often much attenuated whence the common name of threadworms. In length they vary from a few millimeters to a metre, but the diameter is relatively insignificant in all cases. The body is covered by a smooth, tough cuticula that is transparent and often relatively thick. It is very resistant to fluids so that the preservation of specimens is difficult. The outer surface may be marked by fine circular striæ and sometimes carries bristles, hooks, spines or scales, especially near the anterior end, but it is always devoid of appendages and never manifests true segmentation.

A cross section shows that the greater part of the thickness of the body-wall is composed of a massive layer of longitudinal muscles. The body cavity is spacious but not lined by a peritoneal epithelium. It contains the alimentary and reproductive organs. The muscle layer is interrupted at four points by the so-called lines or areas of which the lateral are most conspicuous. They are thickenings of the hypoderm, elsewhere very thin, and appear usually in surface aspect as narrow bands. In some species these lines contain the minute excretory canals as well as nerve cords and ganglion cells. The nervous system is difficult to determine save for a ring commissure that encircles the esophagus; from it nerves pass anteriad and posteriad. Sense organs are present though few in number and simple in type.

The anterior end is provided with the mouth opening, about which is developed a series of lips and often a complicated buccal capsule. These features vary widely in different groups. The alimentary canal is a straight simple tube, starting with a prominent muscular esophagus that opens into a thin walled digestive mid-gut, and terminating in a short, simple rectum. The anus is near the posterior end on the ventral surface.

The reproductive system has the form of a long slender coiled tube which is single in the male and double or Y-shaped in the female. In the former it opens into the rectum, forming a genital cloaca, whereas in the female it has a separate pore which may be in the centre of the body or near either end but has no connection with the alimentary canal. In both sexes the tube has regions slightly different in calibre and structure, corresponding to the germ producing and storing organs in other animals. Around the female sexual pore are found enlargements and near the male orifice papillæ in number and arrangement characteristic of the species. In many forms the tail of the male carries cuticular expansions in the form of wings (alæ) or a caudal bell with ribs like an umbrella, known as the bursa. In the male also one finds one or two, rarely three, chitinous spicules, needle-shaped copulatory organs, that often project from the cloaca.

The true nematodes are oviparous, but in some cases the ova are retained in the uterus so long that development is completed and they hatch out before being extruded so that living embryos are discharged from the uterine pore. All stages are known between the two extremes noted. When the eggs undergo development

externally they are provided with a thick resistant shell, but when they hatch in the uterus the shell is very thin. The development itself is very simple in that there is formed within the shell a minute worm without complex changes in form. In most parasitic species this larval worm enjoys at least a brief period of free existence before it starts upon the parasitic life, and this time is passed in water or mud. From this habitat it is transferred by chance to a new host. This may be the host of the adult or it may pass first into an intermediate host and not reach the final host until later. In some cases the larvæ are discharged into the tissues of the host in which the adult worms live and are transferred to a new host by the agency of a blood-sucking insect like the mosquito, in the body of which the young parasite undergoes certain necessary changes preliminary to its entrance into a new final host. For instances of the complex developmental conditions that enter into the life history of particular species see the accounts under *FILARIA*, *HOOKWORM*, *LOA*, *TRICHINA*.

The Nematoda include species like *Angiostoma nigrovenosum* which lives now free in the mud of a pond and again parasitic in the lung of the frog, as well as consistent free-living species and still others that are highly specialized parasites. Most parasitic species inhabit some part of the alimentary system, but others frequent the lymph or blood system, and there are those that confine themselves to serous cavities and the connective tissues. (See *FILARIA*; *LOA*). No satisfactory system has yet been worked out for classifying the various types of nematodes. A few distinct groups designated commonly as families are recognizable, and in them can be placed the most important and best known genera and species. Among these families are the following:

Anguillulidæ, small transparent free living forms having an esophagus with one or two bulbs at the posterior end. Male with two equal spicules. Female with double uteri, short ovaries reflexed, and few large eggs. The best known forms are the vinegar eel and the paste eel, which are abundant and easily obtained.

Strongyloidea, male has broad, well developed bursa with radial ribs. Buccal capsule usually well developed in both sexes, spherical, with serrate or dentate margin. This group contains a large number of dangerous parasites, among which the hookworms (q.v.) may be cited as representative both in general structure and in parasitic habits.

Filaroidea, very long slender forms with simple esophagus and without conspicuous lip or true buccal capsule. The bursa is replaced by caudal alæ or is entirely wanting. The vulva is far anterior and the eggs hatch in the uterus, so that living young are produced. The Guinea worm, *Dracunculus medinensis*, the African eyeworm (*Loa*, q.v.) and the blood filariæ are important human parasites in this group.

Spiruroidea, much like the *Filaroidea* save that the esophagus is double and the oral margin often has two conspicuous lips. The species are parasitic in lower vertebrates and occur only rarely in mammals.

Ascaroidea, stout bodied, opaque forms of some size, with three lips around the oral opening. One lip is dorsal and two ventral. These

forms are oviparous. Here belong the stomach worm, *Ascaris lumbricoides*, and the pin worm, *Oxyurias vermicularis*, cosmopolitan human parasites known from remote antiquity; and many other species from other hosts.

Trichinellidæ, with very long slender capillary, non-muscular esophagus, and intensive parasitic habit. Of this small group the trichina (q.v.) is a typical representative. The whipworm, *Trichuris trichiura*, is the commonest of human parasitic worms and is spread over the entire earth. It is more abundant in warmer regions where nearly every individual is infested. (See *NEMATHELMINTHES*). Consult Braun, M., 'Die tierischen Parasiten des Menschen' (Würzburg 1915); Fantham, Theobald and Stephens, 'The Animal Parasites of Man' (New York 1916); Geodoelst, L., 'Synopsis de parasitologie' (Bruxelles 1911); Ward and Whipple, 'Fresh Water Biology' (New York 1918).

HENRY B. WARD.

NEMATOGNATHI, a group of fishes, the cat fish (q.v.).

NEMATOPHYCUS, a genus of fossil brown algæ, preserved in the early Palæozoic rocks of the eastern United States and Canada, the stems of which were often several inches in diameter. Specimens have also been found in Europe.

NEMCOVÁ, nyěm'tsō-vā, **Bozena** ('BARBARA PANKL'), Czech poet: b. Vienna, 4 Feb. 1820; d. Prague, 21 Jan. 1862. Her reputation was made largely by the collections, 'National Tales and Legends' (1845-46), and 'Slovak Tales and Legends' (1858). Her 'Sebrané Spisy' ('Collected Works') appeared at Prague (with a biographical sketch by Podlipská). One of the best of her original stories from common life was 'Babička' which was published in a German version as 'Die Grossmutter' in Reclam's 'Universalbibliothek.' It was translated into English by Gregor in 1891. Consult Jakubec, 'Geschichte der čechischen Litteratur' (Leipzig 1907).

NEMEA, nē'mē-ā, Greece, a classic valley of Argolis, the site now marked by the village of Nemea, due north of Argos, on the railroad to the Gulf of Corinth. The valley from north to south is from two to three miles long and more than half a mile broad. It possessed a sacred grove, with a magnificent temple to Zeus, and here biennially were held the celebrated Nemean Games (q.v.), one of the four great national athletic and musical festivals of the Greeks. Consult Gardiner, E. N., 'Greek Athletic Sports and Festivals' (London 1910).

NEMEAN (nē'mē-ān or nē-mē'ān) **GAMES**, in ancient Greece, public games or festivals celebrated at Nemea (q.v.). The Argives were the judges at these games, which comprised boxing and athletic contests, as well as chariot-races. The conquerors were crowned with olive.

NEMERTINEA, a class of *Platyhelminthes* (q.v.) of which a few are terrestrial and a few occur in fresh water, but the great majority are marine. As a rule they have a flattened or rounded body without any processes and covered on the outside with cilia. The mouth is on the ventral surface at the anterior end and the

vent at the opposite end of the body. The alimentary canal is straight; in some with enlargements on either side at regular intervals. Above the alimentary canal is a peculiar proboscis which can be everted through an opening above the mouth, by means of which the animal captures its prey, which consists of other animals, largely of worms. There is no body-cavity, the body being solid from the intestine to the outer wall, except for the small tubes of the blood vessels and excretory organs. The sense-organs are the usually present eyes, which may number two or more, what appears to be an auditory organ, and also, in many, grooves upon the sides of the head which are usually regarded as organs of smell. The nervous system consists of a "brain" around the anterior part of the alimentary canal, from which three nerve cords (two lateral and one between the digestive tract and the proboscis sheath) run backward through the body. Some nemertines develop directly while others go through a complicated metamorphosis, assuming first the so-called "pilidium" form (see LARVA), and later casting of part of the body. In most cases the two sexes are in different individuals. The excretory system is much like that of the other Platyhelminthes in the possession of flame-cells. Most nemertines are small, but some reach respectable dimensions. One species on the New England coast can stretch itself to a length of 15 feet or retract itself to two. The largest species (*Lineus longissimus*) may extend to 90 feet.

NEMESIANUS, nē-mě-sī-ā'nūs, **Marcus Aurelius Olympius**, Latin poet of the close of the 3d century B.C., probably a Carthaginian. He won much fame by his verse at the court of Numerianus, who alone surpassed him in composition; wrote on fishing ('*Halieutica*'), sailing ('*Nautica*') and hunting ('*Cynegetica*'), only a part of the last poem being extant; and is supposed to be the author of four pastoral poems found in manuscripts, together with Calpurnius' eclogues, and hence formerly attributed to Calpurnius. The peculiar movement of these pastorals has suggested the theory that the '*Pervigilium Veneris*' is by Nemesianus. All his extant works are edited by Bährens (1879); the '*Eclogæ*' by Schenkl (1885); and English version of the latter by Scott appeared in 1891. Consult Teuffel, W. S., '*Geschichte der römischen Litteratur*' (Vol. III, 6th ed., Leipzig 1913).

NEMESIS, in Greek mythology, the daughter of Erebus and Night. Other accounts make her the daughter of Zeus and Necessity, or of Ocean and Night. She is goddess of retribution, the tamer of the passions, the avenger, the enemy of pride and haughtiness; and she watches over the observance of the honors due to the dead, on which account a yearly festival in memory of the departed was called by the Greek Nemesia. In Rome she was worshipped by victorious generals and gladiators. Nemesis is represented under the figure of a majestic female clothed in a tunic. With the right hand she grasps a part of her garments over her breasts; in her left hand she holds a cup. On coins she appears drawn in a car by dragons, sometimes wearing a mural crown and rarely winged. The great number of coins and gems on which she is found proves her worship to

have been extensive and popular. The seat of her worship was at Smyrna in Ionia, and at Rhamnus in Attica, where there were two temples, one containing the statue of the goddess by Agoracritos, the pupil of Phidias, which is now in the British Museum. Consult More, P. E., '*Nemesis or the Divine Envy*' (in '*The New World*,' New York 1899); Wissowa, G., '*Religion und Kultus der Römer*' (2d ed., Munich 1912); Posnansky, H., '*Nemesis and Adrasteia*' (in '*Breslauer philologische Abhandlungen*,' Vol. V, Breslau 1890).

NEMESIUS, nē-mě'sī-ūs, Greek philosopher: b. in the first half of the 4th century A.D. He became bishop of Emesa in Syria, and has been remembered chiefly through his treatise on '*The Nature of Man*,' which declares the freedom of the will, the supremacy of the spiritual powers, the indestructibility of matter. The book is thought to show some anticipations of the theory of the circulation of the blood. It has been translated into various modern languages. It was edited by Matthæi (Halle 1802). Consult Christ-Schmid, '*Geschichte der griechischen Litteratur*' (Vol. II, Pt. 2, 5th ed., Munich 1913).

NEMI, nā'mē, Italy, a classic lake about 18 miles south of Rome, filling the crater of an extinct volcano, the sides of which are formed partly of basalt and partly of consolidated scoriae. The lake is 1,022 feet above the level of the sea and it has a circuit of five miles. Owing to its beauty, it is accounted the gem of the Alban Mountains and was celebrated by the Latin poets under the name of Lacus Nemorensis or Speculum Dianæ—Diana's Mirror. On the northeast shore near the village of Nemi, a famous temple of Diana was situated, of which modern excavations have yielded interesting remains; remnants of rafts or vessels used in the festival services of Diana and dating from the reign of Caligula, were also recovered from the bed of the lake in 1895. Consult '*Notizie degli Scavi*' (Rome 1895-96); Frazer, J. Y., '*The Golden Bough*' (parts 1-3, 3d ed., New York 1911).

NEMOURS, nē-moor, **Duc de** (GASTON DE FOIX). See FOIX, GASTON DE.

NEMOURS, Louis Charles Philippe Raphael d'Orléans, DUKE OF, French soldier, second son of King Louis Philippe: b. Paris, 25 Oct. 1814; d. Versailles, 26 June 1896. He entered the army in 1826; gained little by the Revolution of 1830, since he had been a favorite with Charles X, who intended to marry him to the daughter of the Duc de Berry; refused the crown of Belgium in 1831; served in the Belgian campaigns and in Algiers, where his bravery won him the grade of lieutenant-general in 1837; became heir apparent by the death of his brother, the Duke of Orleans, in 1842; but was so unpopular that he found it wise not to press his claims in 1848, but to remove to England. He returned to France in 1870, re-entered the army, from whose lists his name was struck by the anti-royalist measures of 1886, and spent his last years in retirement.

NEMOURS, France, a town in the department of Seine-et-Marne, 12 miles south of Fontainebleau on the Paris, Lyon, Méditerranée Railroad and the Canal du Loing. It contains churches dating from the 13th, 15th and 16th

centuries and a fine bridge erected in 1803. The old castle of Nemours, built in the 12th century, is memorable on account of the edict revoking the privileges of the Huguenots, signed here by Henry III, 7 July 1585. Pop. about 5,000.

Nemours, with the surrounding territory, was erected into a duchy in favor of the Count of Evreux in 1404. In 1507 Louis XII bestowed the duchy upon his nephew, Gaston de Foix, who was killed at the battle of Ravenna in 1512. From 1528 to 1689 the duchy was possessed by the house of Savoy. In 1689 it was purchased by Louis XIV, who bestowed it upon the Orleans family. King Louis Philippe gave his second son the title of Duke of Nemours, and the titular dignity is still borne by a branch of the Orleans family. Pop. 4,681.

NENA (nā'na) **SAHIB**. See NANA SAHIB.

NENNIUS, nēn'ī-ūs, British historian: b. in the latter part of the 8th century. He is said to have lived in Wales and to have been the author of the chronicle, 'Historia Britonum,' or 'Eulogium Britanniae,' reaching down to the 8th century. The manuscript, written in Latin, is in the British Museum and the work has been republished several times. The best editions are those of J. Stevenson (1838) and Mommsen, in 'Monumenta Germaniae Historica,' etc. (Vol. XIII, 1898). An English translation by W. Gunn was published in 1819. Ellis speaks of the work as that of "a credulous compiler, though, from the antiquity of his materials, valuable to an inquisitive historian." His work gives the mythical account of the origin of the Britons, the Roman occupation, the settlement of the Saxons and closes with the 12 victorious battles of King Arthur. The writer has preserved valuable fragments of earlier treatises which have been lost. The historical value of his work is not great, but in mythical and legendary matters it has a recognized importance. Consult Zimmer, H., 'Nennius Vindictus' (1893); Gross, C., 'Sources and Literature of English History' (New York 1900).

NEO-DARWINISM. See WEISMANNISM.

NEO-HEGELIANISM, the doctrine of a modern school of philosophy, which has representatives among English, Scottish and American thinkers. They profess their belief in an eternal consciousness, of which the universe is the object; basing their conviction on the theory that in the world of thought consciousness and object are correlatives, and mutually implicated; and that the existence of the physical universe was prior to that of finite consciousness, and this latter is in some way correlated with physiological organisms. The most prominent Neo-Hegelian in England was Green (see GREEN, THOMAS HILL), who may be said to be the founder of English Neo-Hegelianism. Other prominent British Neo-Hegelians are E. Caird, Bosanquet, Bradley and Royce. See HEGEL, GEORG WILHELM FRIEDRICH.

NEO-KANTIANISM, the teaching of those who accept Kant's theory of knowledge, but refuse to acknowledge the doctrine of practical reason as the best guide in working out a metaphysic. Among this school may be mentioned F. A. Lange, P. Natorp and H. Cohen. See KANT, IMMANUEL. Consult any history of modern philosophy.

NEO-LAMARCKISM, the doctrine held by a school of modern naturalists, mainly American, that the results of organic evolution are due mainly to the principles and factors formulated by Lamarck (q.v.) and expounded in the article Lamarckism (q.v.), and not mainly to natural selection as asserted by the Darwinians. The modification and expansion of Lamarck's theories, due to enlarged knowledge, constitute Neo-Lamarckism—a term first applied by Prof. A. S. Packard, who with E. D. Cope and Alpheus Hyatt was among its foremost exponents.

NEO-PLATONISM, the revival and mystical transformation of the Platonic philosophy, mainly through the speculations of non-Hellenic thinkers. The word has, however, two meanings. In the first and historic sense it denotes the metaphysical theories which prevailed during the whole of the third and last period of Greek philosophy; and these theories and their several schools are usually spoken of as three in number: (1) The Jewish-Greek philosophy; (2) Neo-Pythagoreanism (q.v.) and (3) Neo-Platonism proper. In its general sense, Neo-Platonism was a syncretism of Orientalism, Judaism and Hellenism. The favorite subjects of discussion among Neo-Platonists were what they styled the dualistic opposition of the divine and the earthly; God as an abstract conception; contempt of the world of the senses; various theories of intermediate beings, half human, half divine; asceticism and the nature of enthusiasm as expounded in the so-called writings of Hermes Trismegistus (q.v.) and by the Christian Gnostics (q.v.). Near the Neo-Platonists stand Philo (q.v.), Aristobulus, the Essenes and Therapeutæ (qq.v.).

Neo-Platonism in a narrower sense is the philosophy which originated with Plotinus and his school, and not with Ammonius Saccas (q.v.) as an ancient tradition relates. Neo-Platonism was a last attempt made by Alexandrian thinkers to explain the dualism of appearance and reality. This attempt was made by a despairing leap beyond nature and reason; a solution was sought outside rationality, by a sort of intellectual suicide, and the attempts ended in the dreams of passive mysticism. It was taught that if we lose self-conscious thinking, the distinction between subject and object disappears, and if we reach *ecstasy*, we attain "union with God" and in that union all antinomies vanish. If by philosophy we understand rational thinking, Neo-Platonism must be considered a philosophical failure, and as the Neo-Platonist movement was not continued in new developments, it may well be said to represent the exhaustion and dissolution of ancient philosophy.

Its historical movement has three stages. In its first or Roman stage Neo-Platonism was essentially a "scientific" theory. Its main characteristic was the emphasis laid upon knowledge, the object of knowledge being God, and the aim of philosophy to conceive the divine essence immediately and with the innermost activity of the soul. In the second stage of Neo-Platonistic development appeared Iamblichus' systematic theology of polytheism, which distinguished what is usually called the Syrian phase of Neo-Platonism. This theology stood in strong opposition to Christianity. In its

third stage, Neo-Platonism lost its identity and under this name we are presented with a mere scholastic recapitulation, in a dialectic way, of the whole of classical philosophy. This scholastic and historic Neo-Platonism is represented by Proclus (q.v.) who reigned philosophically supreme at Athens until his school was closed by that edict of Emperor Justinian (q.v.) in 529 which was "the official certification of the death of ancient philosophy." In almost all its stages Neo-Platonism was characterized by theurgy, magic and sorcery of all kinds, and Neo-Platonist teachers did not hesitate to call themselves hierophants and to make money by divination. In attempting to repair the ravages wrought in the Greek mind by a despairing Scepticism (q.v.) Plotinus propounded the theory that knowledge transcended reason; that the absolutely true could be comprehended immediately and intuitively, namely, by ecstasy. Such inner knowing was the beholding of "the One" in itself; and a resolving of self into the absolute. The subject could not, it was taught, master the absolute by objective knowledge or through the medium of dialectic.

The Godhead, "the First," "the One," "the Good," is the original Being, incapable of definite characterization, wholly unspeakable and superior to all comparisons; it is "that which stands above being," and is neither thinking, willing, nor desiring. The world emanates from out the Godhead by an eternal, timeless and necessary process, without division of itself or loss of essence. The world, being an effluence or overflowing of the divine, is more or less perfect according to the degree of nearness to or remoteness from its source. Each degree of emanation, however, has for its principle the totality of being. Next to the original "One," reason is the most perfect. It contains in itself the Ideal World and the whole of true and changeless being. Christian Neo-Platonists often identified the reason (*Nous*) of Plotinus with Logos, the second person of the Christian Trinity. That was a mistake. Logos with Plotinus is scarcely more than "law" regarded as "vital force" and in operation resembling instinct. The Johannean Logos is both immanent and transcendent. From reason emanates the World-soul, though reason incurs no change thereby. The World-soul actualizes reason in the outer world; it gives external qualities to sensible matter, which is the last and lowest of the emanations. Matter is itself undetermined, has no quality nor being. The visible universe is only a transcript of the World-soul. Plotinus does not concern himself much about the fact of the imperfections of individual things and the sin which exists in the world. As the World-soul links reason and matter, so do individual souls partake both of reason and sense. Mankind has a supersensible soul, which has pre-existed, and a lower soul which builds up the body. Souls came down from the rational or light-world, which is their real home and retain a recollection of it, hence their longings are always for a return. From these longings come our redemption and our prospective union with Divinity, and the degree of seriousness with which we realize them determines our worth as individuals. Pure sense-perceptions do not help the soul in its soaring which is rather promoted by thought

and reflection. The strongest incentive and most potent force in the elevation of human nature is love of the beautiful, the Platonic *êpos*. Neo-Platonism, together with Neo-Pythagoreanism, which had preceded it, represents an effort of paganism toward reform and reconstruction in order to meet the supernaturalism, monotheism and universalism of the victorious Christianity which was everywhere pushing hard upon pagan thought and religion. In Iamblichus ("the divine" or "the famous hero" as Emperor Julian (q.v.) called him) Neo-Platonism finds expressed its religion, and expressed not so much according to Plato as according to Pythagoras (q.v.). Iamblichus created a fantastic pantheon in order to bring the entire world of gods into a system, in which he co-ordinated all cults, excluding Christianity, which was feared as a rival; but this erudite religion failed to meet "the desire of the nations" or "the spirit of the times." "Any old woman of the Christians," said Augustine, sarcastically, "is wiser than these philosophers."

Neo-Platonism, as represented by Proclus, made a last supreme effort to retain an authoritative position in the world of thought. Proclus attempted to systematize the entire historical content of Greek philosophical thought, and place it upon a coherent and logical basis, but the effort was fruitless. A few feeble echoes of this teaching are perceptible in the writings of some of the Church Fathers, as for instance, Clement and Origen. Subsequent phases of philosophic speculation bear sometimes the imprint of Neo-Platonism. Attempts were made by Ficinus (1433-99), a celebrated Italian scholar, by Pico della Mirandola and other Florentines for its restoration. The English "Cambridge Platonists" in the 17th century also tried to revive it. Thomas Taylor (q.v.) (1758-1835) may be called the last European Neo-Platonist. Consult Guthrie, 'The Philosophy of Plotinos' (Philadelphia 1896); Kirchner, 'Die Philosophiedes Plotin' (Halle 1854); Richter, 'New Platonische Studien' (Halle 1864-67); and the larger Histories of Philosophy, such as those of Ueberweg, Wendelband and Zeller.

C. H. A. BJERREGAARD,
New York Public Library.

NEO-PYTHAGOREANISM, a Hellenistic school of philosophy which, after the custom of the times, attached to itself the name of Pythagoras, together with his numerical symbolism, although it drew much more largely from Platonic sources. It was founded in the 1st century B.C. by Nigidius Figulus, a Roman magistrate and its chief exponent was Apollonius of Tyana (q.v.), whose philosophical teachings took the form of a controversy with the Neo-Platonists. Neo-Pythagoreanism coupled the Platonic belief in the existence of real ideas with the theory that these are mental in nature—that is, that they are ideas, in the modern sense, in the mind of God. The consequent dualism between a God purely mental in nature and an absolutely non-mental matter received such an ethical trend as to be strongly suggestive of an Oriental influence, though precedents for such a view may be found among the earlier Greek thinkers and indeed in the works of Plato himself. At any rate, many ideas even more strictly Oriental in char-

acter were incorporated into Neo-Pythagoreanism. These were conjoined with a strong ascetic trend, based apparently on the ethical dualism, yet reminiscent of the Stoic-Cynic tradition. Consult Zeller, 'Die Philosophie der Griechen' (Leipzig 1880-81); Vacherot, 'Histoire critique de l'Ecole d'Alexandrie' (Paris 1846-51).

NEOCENE, in geology, a term used by the United States Geological Survey to include what Lyell called the Miocene and Pliocene periods. The word means "new (or late) recent," and is contrasted with Eocene, "dawn (or early) recent." See TERTIARY.

NEOCOMIAN (Lat. *Neocomum*, Neuchâtel), in geology, a term applied to the lowest marine stages of the Cretaceous system, because of its typical occurrence at Neuchâtel in Switzerland. There and in southern France this formation, consisting of limestones and marls, is as much as 1,600 feet thick. The term corresponds to the English Wealden and lower greensand, and to the German Hils; is little used in America, and in France is used broadly and strictly, Neocomian in the wider sense including the stricter Neocomian (made up of Hauterivian and Valanginian), as well as Barremian and Aptian. Consult Paylow, *Quarterly Journal London Geological Society* (Vol. LIII, 1896).

NEODYMIUM, in chemistry, an element whose existence as a constituent of didymium (q.v.) was recognized by Auer von Welsbach. It occurs in cerite. It has the chemical symbol Nd and an atomic weight of 144.3, and is distinguished from other constituents of didymium by yielding rose-colored salts. Its oxide has the formula Nd_2O_3 . Pure neodymium salts were first obtained by Demarcay in 1898. Metallic neodymium melts at 840° C., has a specific gravity of 6.9, and decomposes water slowly when cold and rapidly at the boiling point. Its properties are much like those of cerium (q.v.). Consult Kellermann, 'Die Ceritmetalle und ihre prophore Legierungen' (Halle 1912).

NEOGENE (Greek, "late-born," "late"), in geology, a term used by Continental geologists to include the Lyellian Pliocene and Miocene, that is corresponding with Neocene (q.v.), as used by the United States Geological Survey.

NEOHIPPARION, a genus of primitive horses found fossil in the Upper Miocene and Lower Pliocene of the western United States. Complete skeletons have been obtained, and show this horse to have been a small pony with slender deerlike legs and three functional toes. It was probably the earliest kind of horse adapted to a grazing life in a desert region, and appears to have been very numerous and represented by two or more species.

NEOLITHIC PERIOD, The. The Neolithic (Greek *neos*, recent, and *lithos*, stone) Period was so named because in it man ground some of his stone tools, especially the celt or ax, whereas, Paleolithic man made only chipped implements. More important differences than these, however, distinguish the cultures of the two periods. Paleolithic man was a hunter and knew nothing of agriculture; he had no domesticated animals, not even a dog; he had not

learned to make pottery and, consequently, cooking as an art had not been acquired. Early in the Neolithic Period, on the other hand, man had domesticated the dog, cow, sheep, pig, horse and goat; he planted and harvested grains of various sorts; he had learned to spin and weave and make pottery.

Transition between the Paleolithic and Neolithic.—The meaning of the rather sharp break between the Paleolithic and Neolithic has given rise to much discussion. With the evidence now at hand one can do little more than speculate on the reasons for the seemingly sudden change in Europe from the old to the new. As the climate of Europe changed and the animals which Paleolithic man hunted disappeared, and as the population became too dense for the supply of food obtained by the chase, other means of securing food necessarily would be sought. Edible seeds would be gathered and stored and some of these, scattered by chance, would grow and methods of cultivating them would speedily be devised. The domestication of animals was probably brought about by rearing the captured young of wild animals such as the sheep and goat, some of which were kept until grown and offspring born. The new requirements of a more sedentary life which would result from this readjustment would lead to the invention of new tools, or the better finish of old ones, and it is not surprising that Neolithic man early learned to grind and polish the edges of his stone axes. There is little evidence that the higher civilization of the Neolithic was developed in Europe, but rather it is probable that tribes of Neolithic people who had made progress in some other continent migrated to Europe and either absorbed the Paleolithic inhabitants or destroyed them. If the Paleolithic inhabitants were absorbed peaceably by the new immigrants, the amalgamated population would necessarily adopt the mode of living best suited to the altered conditions of the environment, i.e., Neolithic methods. "The gradual disappearance of the reindeer and other mammalia would henceforth necessitate a complete change in their manner of living. The nomadic hunter would soon sink into the herdsman, and the mechanic would readily lay aside his roughly chipped tools for those with finely ground and polished edges. On the other hand, should a few cave shelters in one or two favorite localities continue to be inhabited after the arrival of the Neolithic tribes on the scene there might be few traces of amalgamation to be found." (Munro). It is evident that the newcomers would learn something from the inhabitants among whom they settled and that certain of their tools and methods of making tools would be acquired and retained in the new civilization.

Some authorities hold that the last phase of the Paleolithic, the Azilian (see PALEOLITHIC PERIOD), nearly bridges the gap between the two periods. If the inhabitants of Maglemose (Great Peat Bog) on the Island of Zealand, Denmark, were Paleolithic people the gap is even more nearly filled. This station is a peat bog several hundred yards from the old shore of a lake which, on geological grounds as well as on the evidence of the flora and fauna, is shown to be older than the kitchen middens or shell heaps, which are generally considered to

le the oldest works of Neolithic man. One remarkable feature of the Maglemose remains is that the huts of the people were built on a huge raft or floating island. Many chipped flint implements have been found but none showing any trace of polish. No pottery has been discovered but many objects made of bone and staghorn, such as daggers, fish-hooks and harpoons.

Kitchen Middens or Shell Heaps.—It is generally agreed that the shell refuse heaps, so well preserved in Denmark, were made by man near the beginning of Neolithic times. Some of the kitchen middens are as much as 10 feet thick, more than 900 feet long, and from 100 to 200 feet wide. They are composed almost wholly of shells, with a few bones of fishes, birds and mammals, some fragments of pottery and a few flint implements. Everything in the heaps was brought to the spot by man. The most abundant species of shell-fish in the mounds are the oyster, the cockle (*Cardium edule*), the mussel (*Mytilus edulis*), and the periwinkle (*Littorina littorea*). Of these shell fish the oyster has disappeared from the neighboring waters, and the cockle and periwinkle are much reduced in size. Among the bones of wild birds which occur are those of the duck, goose and wild swan. The fact that the wild swan visits Denmark only in the winter is probably evidence that these ancient Neolithic fishermen did not migrate from one part of the country to the other at different seasons.

The flint implements of the kitchen middens consist of long flakes, 8-13 inches in length, some of which were used for knives; triangular axes, none of which are ground on the edges, awls and the so-called pick. Bone and horn tools, and, for the first time in man's prehistory, fragments of pottery also occur. The making of pottery was a momentous discovery for primitive man, since by its use he was enabled to cook a greater variety of foods and to render others more digestible and palatable. It is to be noted that polished flints are absent in these early Neolithic deposits. Sites of huts inland have also yielded potsherds and unpolished stone implements but no polished flints. The similarity of some of the tools to those of the kitchen middens indicates that these remains are of the same age. The term Campignian has been given to these remains, which are probably contemporaneous with the Kitchen Middens.

Lake Dwellings.—During the greater part of the Neolithic Period huts erected on piles driven into the mud of the shallow waters of the larger lakes of Switzerland were inhabited by man. The lake villages were connected with the shores by draw bridges and the inhabitants used large canoes dug from trunks of big oak trees. Lake dwellings were more common in Switzerland than in other parts of Europe, but Neolithic man also built them in Denmark, Austria, and other countries. Lake dwellings were also used in Europe by men of the Bronze Age, and even at the present time houses built on piles driven into the mud of lakes and other bodies of water are occupied by the natives on the estuaries of the Amazon and Orinoco rivers by natives of New Guinea, Central Africa, Borneo and elsewhere.

A great deal is known of the life of the

Neolithic lake dwellers because of the excellent preservation of their implements and household utensils in the mud and peat of the lake bottoms, where they fell after the destruction of the dwellings by fire or where they were lost or thrown from the platforms upon which the wattled huts were built. Stone axes with wood or staghorn handles, arrowheads, barbed harpoons of staghorn, fish hooks and needles of bone, and wooden utensils such as tubs, spoons, and plates have been unearthed. Cloth was made of wool and flax, and fish nets and fish lines of flax.

The pottery shows that the lake dwellers made utensils of clay of sufficiently good quality to withstand fire as is indicated by the soot which still coats the bottoms of some of them.

The lake dwellers cultivated wheat, barley, millet, and flax as is shown by the presence of these cereals in the mud among the piles. Loaves or cakes of unleavened bread made from wheat and millet have been discovered, and show the approach to a modern mode of life. Stable refuse on the lake bottoms beneath the ancient huts indicates that horses, sheep and cattle were domesticated and were stabled in the lake dwellings. The advantage of lake dwellings to Neolithic man consisted largely in the protection they afforded to their possessors because of their easily defended positions.

Burials.—The Neolithic people honored some of their dead by burying them with their most precious possessions under mounds of earth or stone, called barrows or tumuli. In Great Britain some of the barrows are 200-400 feet long and 60-80 feet wide and generally contain one or more chambers constructed of huge slabs of stone. In Great Britain there are two forms of the barrow, the long barrows which contain skeletons with long-headed or dolichocephalic skulls, and the round barrows which contain short-headed or brachycephalic skulls. Some barrows contain a single skeleton whereas others were family or tribal cemeteries. In Denmark a single tumulus contained 70 burnt interments. Tumuli were also erected in the Bronze Age and many beautiful bronze implements have been discovered in them.

Dolmens are structures formed by great stone slabs set on edge and capped with one or more slabs forming a table-like structure. The size of some of these roof stones and the difficulty of placing them in position is realized when it is known that some of them weigh as much as 40 tons. Some of the dolmens were formerly covered with earth and stones which have since been removed either by man or by the natural process of erosion.

Classification.—An entirely satisfactory classification of the Neolithic in Europe has not yet been made, but that of Montelius for Sweden seems to be well established. It is based on the variations in form of the chipped and polished ax heads or celts which were gradually evolved or introduced and upon geological evidence. Beginning with the most recent deposits the classification is as follows:

Stage IV (Youngest). Axes of the thick or broad-headed type with relatively flat sides and nearly square cross-section at about the middle. Axes with shaft holes. Exquisitely chipped, broad-bladed, flint daggers with a narrower portion for a handle. In some places the burials were in stone cists.

Stage III. Axes about the same as in Stage IV. Narrow-bladed flint daggers of beautiful workmanship. Graves with covered passages.

Stage II. Axes of the small or thin-necked type, almost rectangular in form and with strongly arched sides and square angles, Age of Dolmens.

Stage I (Next to Campignian and Kitchen Middens in age). Axes of the pointed-necked type, either rough hewn or polished. Triangular in cross-section.

Climate and Geography.—The climate of Switzerland during Neolithic times seems to have been nearly, if not quite, as it is now as is shown by the seeds and fruits which have been preserved in the mud and peat under the lake dwellings. The wild species do not differ from similar species in the same region to-day and the cultivated grains are unlike those now grown in Switzerland in size only. The larger size of our cultivated cereals is doubtless the result of many years of selection.

The physical geography of Europe during Neolithic times did not differ greatly from that of to-day. Great Britain was separated from Europe by the English Channel as it is now. The fact that the cockles, mussels and periwinkles of the shell heaps of Denmark are of full ocean size whereas those of the present Baltic are only about one-third the normal size is proof that the water has been freshened since then and indicates that the connection between that sea and the ocean has been decreased in width or depth by the elevation of the bottom and land near its entrance to the Atlantic. Raised beaches also prove that the coast of southern Norway has been raised about 225 feet since the beginning of the Neolithic Period. As one passes south along the coast of Denmark the Kitchen Middens gradually approach the sea-level until in southern Jutland and Schleswig-Holstein they disappear altogether and are not found again until the coast of Belgium is reached. It is probable that men made Kitchen Middens along the shores south of Denmark, but that a lowering of the land has caused them to be covered with water. This belief is confirmed by the dredging of implements of Campignian Age near Koldin at a depth of 10 or 12 feet. Notwithstanding these minor differences the climate and geography of Europe during the Neolithic was very similar to those of the present.

HERDMAN F. CLELAND,

Professor of Geology, Williams College.

NEON. See LIQUEFIED AND COMPRESSED GASES.

NEOPHYTE (Greek, "newly planted or grafted on"), originally applied to those newly initiated into the Eleusinian or other ancient Greek mysteries, of whom Plato says "there are many wand bearers (the wand being the badge of the initiated) but few mystics." The catechumens who had been just baptized were so styled in the early Church. These newly made Christians were considered less likely to stand firm against paganism than their older and more experienced brethren. Hence the term was slightly tinged with disparagement. Saint Paul forbade the ordination of the neophyte or novice (1 Tim. iii, 6), and the 3d Council of Arles (524) decreed that a year's probation was necessary for candidates for holy orders among the newly baptized. Yet Ambrose was elected bishop of Milan (374) when he was but a catechumen and was consecrated soon after his baptism. Newly converted pagans or disbelievers are still styled neophytes by Roman Catholic missionaries and Gregory XIII established a college at Rome (1622), the Propaganda, in which they might be educated and trained to preach to and convert the people of their own land.

NEOPLASMS. See TUMOR.

NEOPTOLEMUS, nē-ōp'tōl'ē-mūs (also called PYRRHUS), in Greek legend, the son of Achilles and Deidamia. Taken to Troy by Odysseus, he was one of the band who captured the city by means of the wooden horse. He slew Priam and took to himself Andromache, the wife of Hector. He afterward went to Epirus, where he married Hermione, in consequence of which Orestes, her former lover, killed him at Delphi.

NEORNITHES, nē-ōr'ni-thēz, or **EUORNITHES**, a sub-class of the class *Aves* (birds) embracing all known birds, fossil or recent, since the Jurassic Period, as distinguished from another sub-class *Archæornithes*, which contains, so far as yet known, only the archæopteryx (q.v.). The sub-class *Neornithes* may be divided into three sub-divisions, namely, (1) *Ratitæ*; (2) *Odontolcæ*; (3) *Carinatæ*.

NEOSHO, nē-ō'shō, Mo., city, county-seat of Newton County, on the Kansas City Southern, the Missouri and Northern Arkansas and the Saint Louis and San Francisco railroads, about 170 miles southwest of Jefferson City and 140 miles south by east of Kansas City. It was settled in 1839; in 1868 was incorporated as a town and received its city charter in 1878. It is near the lead and zinc mining region of Missouri. The chief manufacturing establishments are machine-shops, flour mills, foundry, agricultural implement works, repair shops and furniture factory. There is located here a government fish hatchery which occupies 34 ponds. It is the seat of the Scarritt Collegiate Institute (M. E. South) and has a high school, elementary schools and a public school library. The city owns and operates the water-supply system. Pop. 3,968.

NEOSHO, a river which has its rise in Morris County, Kan., in the central part of the State. Some of the small streams which form the head-waters have their sources near short streams that flow north into the Kansas River.

The Neosho flows south by east and enters the Indian Territory at the northeast corner. It continues an irregular course, mainly southeast, for a distance of about 40 miles; then turns southwest, which course is continued to its junction with the Arkansas River at Fort Gibson. Its whole length is about 400 miles. Some of the cities on its banks are Council Grove, Emporia, Burlington, Iola, Humboldt, Erie and Oswego, all in Kansas.

NEOTENY. See *PÆDAGENENSIS*.

NEOTROPICAL REGION, or **NEOGÆA**, one of the primary faunistic divisions in the zoogeographical scheme of Wallace and Sclater, embracing South America, Central America, as far north as the highlands of northern Mexico and the West India Islands. It is perhaps the most sharply defined and separable of all the "regions," but shows some extraordinary affinities with Australasia; hence some students of the distribution of animals have united it with those parts of the world in a still more comprehensive "province," called the Notogæic, in contrast with the Northern hemisphere as the Holarctic or Arctogæan province. It is characterized by the broad-nosed monkeys, the vampire-bats, the many peculiar edentates, the absence of antelopes, sheep, goats, horses and oxen, the presence of a fairly large marsupial fauna, including deprotodont forms, several peculiar families of birds, the American ostrich, the dipnoan *Lepidosiren* and very many other peculiarities. See *ZOOGEOGRAPHY*.

NEOZOIC (Greek, "late life"), in *geology*, a term introduced by Edward Forbes, but never in common usage, to include the Mesozoic and Cenozoic, between which he argued there was no such distinction as between them on the one hand and the Palæozoic on the other. The word is sometimes used as an equivalent of Tertiary and sometimes as synonymous with Cenozoic.

NEPAL, nè-pāl, **NIPAL**, nè-pāl', or **NE-PAUL**, Asia, an independent kingdom, on the southwest slope of the highest part of the Himalaya range, north of India, bounded on the north by Tibet, on the east by Sikhim and on the south and west by Bengal and the United Provinces of Agra and Oudh, British India. It lies between lat. 26° 25' and 30° 17' N., and long. 80° 6' and 88° 14' E.; is 500 miles long with a maximum breadth of 150 miles and has an estimated area of 54,000 square miles. The main portion of the country is a table-land from 3,000 to 6,000 feet above sea-level. Within its boundaries are the highest mountains in the world, Everest, Dhawalagiri, and on its eastern border, Kinchinjunga. From the mountains the land gradually descends southward, forming four distinct terraces, differing in climate and vegetation. The Terai or southern lowland, well wooded and extensively cultivated, is traversed by numerous small streams. The most important rivers are the Karnali, the Gandak and the Kusi, all of which rise in Tibet and force their way through the Himalayas by deep and precipitous gorges to join the Ganges. The climate is on the whole temperate, except in the most elevated northern districts, where it is very cold. Magnificent forests of sal, sisoo and toon trees stretch along the declivities of the lower hills into the adjacent plains. The forests higher up exhibit a greater variety, gradually assuming more and more of an Al-

pine character. The principal products are rice, wheat, barley, pulse, potatoes, sugar-cane, buckwheat, hemp, cotton, tobacco and madder. In the mountainous parts a valuable article of cultivation is a large species of cardamom, and in other places ginger is grown to a considerable extent. Pasturage is on the whole scarce and indifferent. The sheep and goats, however, have fine wool. Horses are imported from Tibet. The wild animals are elephants, black bears of great size, hogs, hog-deer, foxes, jackals and a few tigers. Fish abound in the streams of the Terai. The manufactures of Nepal are confined chiefly to two kinds of coarse cotton cloth, called khadi and changa, of which the dress of the middle and lower classes of the people is made. Articles in copper, brass and iron are also manufactured in various places; likewise bells of a kind of bell-metal called phul, but considered inferior to those of Tibet; and also a very strong paper, remarkably well fitted for packages. Wood-carving and pottery are important industries, but appear to have declined in recent years. The trade of Nepal is chiefly carried on with British India and Tibet. From the former it imports Bengal cottons and muslins, silks and raw silk, carpets, English cutlery, etc.; and from the latter Chinese silk stuffs, paper, drugs, gold and silver, sheep, musk, skins of the musk-deer, etc. Its chief exports are the natural products of the country. Exports in normal years aggregate about 48,000,000 rupees and the imports about half that sum. Iron, lignite, copper, lead, zinc and gold are found and mining is carried on in a small way.

The government of the country is a military oligarchy with a maharaja as the nominal head, but a Prime Minister as its real ruler. The latter is assisted by a council, the members of which are chosen by him. The ruler acknowledges a certain amount of dependence on the Chinese government, but is in more real dependence on British authority. A British Resident and a small body of British troops are stationed at the capital, Khatmandu, and British influence is gradually increasing. This is evident in the more humane code of laws now in operation. The foreign relations are controlled by the British Indian government. Revenue is obtained from taxes on land, mines, forest products and monopolies, also from customs. There is a good army of 45,000, consisting mostly of Gurkas, who are able fighters. The population of the country is estimated at over 4,000,000. The inhabitants are chiefly Newars, a race probably of Mongolian and Chinese origin; the dominating race is the Gurkas (q.v.). In the east there is a considerable mixture of Hindus and Bhotias, the latter of Tibetan stock. Other tribes of Nepal are the Limbus, Lepchas, Bokras, Kirantis, Murmis and Tharus. The languages spoken are of the Tibet-Himalayan branch of the Indo-Chinese languages. Parbatya is the common tongue of intercourse. It is written in the Nagari character. The Newars have a language peculiar to themselves. The prevailing religion is Hinduism, but there are also some Buddhists. There is complete religious liberty. Education is in the hands of the clergy and is in a backward state. The majority of the population are illiterate. The upper classes send their children to the institutes of higher learn-

ing in British India. Most of the domestic servants are slaves. The country was formerly possessed by numerous independent rajahs, and extended west to the Sutlej; Hiuen Tsang, a Chinese pilgrim, mentions a ruler of the 7th century, Anuvarma. Harisinha-Deva, rajah of Simraungarh, invaded and occupied Nepal in 1324. But about the middle of the 18th century the rajah of Ghurka began to extend his dominions by conquest, in which he and his successors were so successful that in less than 50 years they had conquered the whole of Nepal and made themselves kings of that territory. Subsequently (1816) a large portion of the kingdom was cut off by the British, who reduced its western limit to the river Kali instead of the Sutlej. By the Kot massacre in 1845 Jung Bahadur made himself master of the country and proved a firm but beneficent ruler; he aided the British during the Indian Mutiny in 1857; at his death in 1877 he was succeeded by his brother who reigned until his assassination in 1885, when he was succeeded by Dhiraj Pirthvi Bir Bikram. The latter died in 1911, and the throne devolved upon his son, Tribhubana Bir Bikram.

A., 'Sketches from Nepaul, Historical and Descriptive' (Cambridge 1880); Waddell, L. A., 'Among the Himalayas' (London 1898); Wright, D., 'History of Nepal' (Cambridge 1877).

NEPENTHE, ne-pen'thē (Greek, *nē*, a negative prefix, and *penthos*, sorrow), a magic potion or drug which was fabled by the poets to banish the remembrance of grief and to cheer the soul. The invention was attributed to the Egyptians. It was given to Helen in Egypt and has been variously identified with opium or some preparation of hemp.

NEPENTHES, a genus of pitcher-plants (q.v.).

NEPHELITE, or **NEPHELINE**, a native silicate of aluminum and sodium, of the formula $\text{Na}_2\text{Al}_2\text{Si}_2\text{O}_8$, crystalizing in the hexagonal system and also occurring in massive forms. It exhibits various colors and has a vitreous lustre, a hardness of from 5.5 to 6 and a specific gravity of about 2.6. It occurs in recent eruptive rocks, notably at Mount Somma, Vesuvius and at Hot Springs, Arkansas. Leucite, a similar mineral, is found in the same sort of place and contains potassium in place of sodium.

NEPHELIUM, a genus of fruit-trees. See **LITCHI**.

NEPHI, nē'fī, Utah, city, county-seat of Juab County, on the San Pete Valley and the

San Pedro, Los Angeles and Salt Lake railroads, about 80 miles south of Salt Lake City. It is in a high valley in which there are a number of good farms. The chief products of the surrounding country, all of which contribute to the prosperity of Nephi, are farm products, salt, gypsum, lumber and livestock. The city operates an electric-lighting plant and a modern water-supply system. Pop. 2,759.

NEPHOSCOPE, nēf'ō-scōp', an instrument for determining the apparent velocity and motion of clouds. It is in the form of a horizontal mirror, with compass-points or degrees drawn on the mirror, or on the surrounding frame; with an adjustable sighting piece placed above the mirror. The sighting-piece serves as a fixed point for viewing the cloud shadow as it moves away from the centre of the mirror.

NEPHRECTOMY, nē'frēc-tō'mē, the excision or removal of a kidney. In cases of tuberculosis, calculi, multiple abscesses, pyonephrosis, hydronephrosis, sarcoma, wounds, tears and ruptures of the ureters, this operation may be called for. The removal of a single or horseshoe kidney is considered a fatal operation. Before removing a kidney it is necessary to ascertain whether the remaining organ is capable of excreting its due amount of urine. Abdominal nephrectomy (anterior nephrectomy) is the excision of a kidney through an incision in the abdominal wall; lumbar nephrectomy the most common method (posterior nephrectomy), an excision, through an incision in the loin.

Nephrorrhaphy, nephropexia, or nephropexy is the fixation of a movable kidney by sutures.

NEPHRITE. See **JADE**.

NEPHRITIS. See **CIRRHOSSIS**; **KIDNEYS**.

NEPHROTOMY, nē'frōt-o'mē, incision of a kidney, an operation deemed necessary by the surgeon when it has been ascertained by exploration with the aspirator-needle or otherwise that the kidney is the seat of any condition or disease which endangers the life of the patient. It is resorted to for the removal of calculi (nephrolithotomy), of tumors and for relieving congestion.

NEPHTHYS, nēf'this, in Egyptian mythology, a deity, sister of Osiris and Isis, wife of Typhon, and mother of Anubis by Osiris. Some consider her as the symbol of the Egyptian coast on the Mediterranean; others as the personification of the five intercalary days of the Egyptian year, in which point of view they are called her children by Mercury, the Sun and Saturn; or as a protector of the dead from evil influences. This meaning comes from the legend of her mourning the loss of Osiris with her sister Isis. Consult Budge, E. A. T., 'The Gods of the Egyptians' (Vol. II, London 1904).

NEPIDÆ. See **FRESH-WATER INSECTS**.

NEPIGON, or **NIPIGON**, a lake in Canada, in the northwestern part of the province of Ontario; about 35 miles north of Lake Superior. It is 813 feet above Superior; about 60 miles long and 45 miles wide; its outlet is Nepigon River, which flows south and enters Lake Superior through Nepigon Bay. Area, 1,730 square miles. The coast line is remark-

ably rocky and irregular, in some places forming lofty headlands; the total length of coast line is nearly 580 miles. It has a number of small wooded islands. Several streams enter the lake, and in the vicinity are a large number of small lakes, all of which, together with Nepigon, once formed a very large lake. The lake is a favorite place for sportsmen as it is well stocked with fish.

NEPOMUK, Johann, yō'hān nā'pō-mook, patron saint of Bohemia: b. Pomuk; about 1340; d. Prague, 20 March 1393. He rose to be a high ecclesiastical dignitary, and was put to death at the order of King Wenzel IV of Bohemia by being thrown into the Moldau River. Differences as to Church policy and other reasons, often conflicting, are assigned for this procedure. But the most authentic account, compiled (1670) originally by Bohuslav Balbinus, a Jesuit, narrates the story as follows: According to Balbinus, Nepomuk obtained the degree of magister at Prague, eventually became almoner of King Wenzel and confessor to Queen Johanna and, after imprisonment and torture, was put to death for refusal to divulge certain matter of the confessional. Balbinus dates the martyrdom in 1383, but the best sources make the time as above given, 10 years later. Hajek of Labocan conjectured (1541) that there were two Johns and this idea was assumed by Balbinus; but Dabrowski established (1787) the fact that there was but one. Abel ('Die Legende vom heiligen Nepomuk' 1855) presented the curious theory that John of Nepomuk was really the development of the Protestant hero, John Huss, into a Catholic saint. But this is altogether without foundation. Previous to his canonization by Pope Benedict XIII in 1729, Nepomuk had already been venerated as protector against slander and danger by water. His day, 16 May, is still observed in Bohemia as a time of high festival. Consult Frind, 'Der geschichtliche Johannes van Nepomuk' (2d ed., 1871); and for the various contemporaneous accounts and the questions as to the existence of two persons of this name consult article 'John Nepomucene' in the 'Catholic Encyclopedia' (New York 1910); also 'Nürnberger in Jahresbericht der schlesischen Gesellschaft für vaterländische Kultur' (1904).

NEPOS, nē'pōs, Cornelius, Roman historian: b. Upper Italy, about 100 B.C.; d. about 24 B.C. His earliest writings consisted of verses and three books of 'Chronica.' With the exception of a geographical treatise, his remaining works were directed toward the study of manners, customs and character. Such are the five books of 'Exempla,' supposed to have been an account of the men who stood as types of the virtues of earlier Rome. Such, too, were the elaborate biographies of Cicero and Cato the Elder. But the most comprehensive of his publications was the 'De Viris Illustribus' ('Of Illustrious Men') in probably 16 books, in which the lives of foreigners and of Romans were juxtaposed in a parallel arrangement. Of this there are extant the portion 'De Excellentibus Ducibus Exterarum Gentium' ('Of Prominent Foreign Generals') and the biographies of Cato and Atticus. The lives of Atticus and Cato have been uncontestedly assigned to Nepos, but until the edition of Diony-

sus Lambinus (1569) the 'De Excellentibus Ducibus' was supposed to be the work of a certain Æmilius Probus. Lambinus' verdict, based on both historical and stylistic grounds, has been almost universally accepted. The style of Nepos is too colloquial; his matter is often lamentably inaccurate; but the essays are in general well arranged and fair in their judgments. There are several good editions by Nipperdey (rev. by Lupus 1879), by Lindsay (New York 1895); Flagg (ib. 1895) and others. Consult Schanz, M., 'Geschichte der römischen Litteratur' (Vol. I, part II, 3d ed., Munich 1909).

NEPOTISM, a system or custom practised by several of the earlier popes of granting high honors, dignities, offices, pensions and the like to their family relations, generally their nephews; hence family favoritism of any sort.

NEPTUNE, (1) in astronomy, the most distant planet of the Solar system, its mean distance from the sun being 2,795,998,000 miles, and its least distance from the earth 2,629,000,000 miles. The eccentricity of its orbit is .00872; its inclination to the plane of the ecliptic is 1° 47'. The apparent diameter is about 2' 7". The real diameter is estimated at about 36,000 miles, and it seems to have very little polar compression. Its mass is about 16¾ times that of the earth. The largest telescopes give us little information as to whether or not it has belts. A satellite of Neptune was discovered by Lassell of Liverpool in 1846. It is peculiar in revolving from east to west. Neptune revolves round the sun in 164.6 years. The discovery of Neptune was an interesting piece of deduction based upon a known disturbance of the motion of Uranus. Leverrier, a Frenchman, proved that this disturbance could only properly be ascribed to some other, as yet unlocated, heavenly body, and his computation of its probable situation led to its discovery by Galle of Berlin, on 23 Sept. 1846. Airy of England also computed its location about the same time. (2) In Roman mythology the god of the sea; son of Saturn and Rhea, and brother of Jupiter and Pluto. He is variously represented; sometimes with a trident in his right hand, a dolphin in his left, and with one of his feet resting on part of a ship; at others in a chariot drawn by sea-horses, with a triton on each side. See POSEIDON.

NEPTUNE, Temple of, the name of two ancient structures, one at Paestum in Lucania, and the other on the Campus Martius in Rome. The latter was erected by Agrippa 26 B.C. It was destroyed by fire 80 A.D., but was restored by Hadrian.

NEPTUNIAN THEORY (Lat. *Neptunus*, god of sea), in geology the view advanced by Werner (q.v.) that geological change is due entirely to the influence of water, the earth in the beginning having been covered with water, which hold rock-material in solution. This hypothesis, also styled Diluvian Theory, was opposed by the Vulcanians, who held the igneous or so-called Plutonic theory. It is now recognized that though perhaps most rocks are of sedimentary origin, igneous rocks also form a large part of the crust of the earth. See GEOLOGY.

NERAC, nā-rāk', France, a town, capital of an arrondissement in the department of Lot-et-

Garonne, 16 miles southwest of Agen, on the precipitous banks of the Baise. In its old castle, now a mere ruin, Henry IV, of whom there is a bronze statue in the town, spent part of his youth, and at an earlier period Calvin and other reformers found an asylum with Margaret of Valois, queen of Navarre. The town has manufactures of coarse woollens, ship-biscuit, corks, coaches, cloth, beer, brandy, and trade in wine, grain and hemp. Pop. 6,300.

NERBUDDA, nēr-būd'dā, or **NARBADA**, nār-bā'dā, India, a river which rises in the Malkal range, 3,493 feet above sea-level, in the north of the Central Provinces, flows first west and northwest across the Amarkantak plateau, then west, inclining gently to the south, and after forming part of the boundary between the Central Provinces and Indore, falls into the Gulf of Cambay, after a course of about 800 miles. In the wet season it rises in some places 25 feet, and in others 70 feet above its lowest level. Though much obstructed by shelves and cataracts, it is navigated by boats to the falls of Daree, about 250 miles from its mouth. To the Hindus the river is a sacred stream, almost equal to the Ganges in sanctity. It is regarded as a meritorious act to walk from the sea to its source and back again along the banks of the river. There are valuable coal and iron beds in the valley near Hoshangabad, and a railroad skirts the river from Barhanpur to Sihora.

NEREIDS, nēr'ē-īdz, in Greek mythology, were sea nymphs, daughters of Nereus and Doris. They were 50 in number, and they had, like their father, the gift of prophecy and the power of assuming different shapes. They were specially the nymphs of the Mediterranean, and were distinguished on the one hand from the Naiads or the nymphs of fresh water, and on the other hand from the Oceanides or nymphs of the ocean. Few of them figure in legend as individuals, among them principally is Thetis, mother of Achilles. In art they are represented as observing the contests between sea-deities, and a favorite portrait is that of the Nereids bringing the armor forged by Hephaestus to Achilles.

NEREIS, a marine annelid, one of many species, scattered throughout the world, of polychaet worms (see *ΠΟΛΥΧΕΤΑ*), of the family *Nereidae*, which contains the most highly organized of this group of animals — "the highest type of *Annulata*" according to Packard. Their bodies are visibly annulated, flat and scaly. A distinct head is present, provided with a retractile proboscis, which is usually armed with teeth or jaws. Eyes and tentacles are borne on the head. The locomotive appendages are very fully developed, and the respiratory or breathing organs, in the form of tuft-like branchiae or gills of rudimentary nature, are borne on the dorsal aspect of the body-segments. The sexes are separate, the eggs are probably laid in masses between tide-marks, and the young at first appear as surface-swimming ciliated bodies, but the stages of development have not been traced. The posterior segments of certain species of *Nereis*, when they contain generative products, become markedly unlike the anterior segments, and the animal comes to be known as a *Heteronereis*. This was formerly supposed to be a distinct genus. A typical and numer-

ous species on the Eastern American coast is *Nereis virens*, which lives between tide-marks in holes in the mud. It secretes a viscid fluid lining its hole, up which it moves, pushing itself along by its bristles and ligulae. At night probably, during the breeding season, they leave their holes and swim at the surface of the water. Some of these nereids are commensals. *N. bilineata* and *N. succinea* inhabit the tubes of a species of *Teredo*, and *N. costae* is found in the cavities of sponges. Consult Packard, 'Zoology' (1897); Arnold, 'Sea Beach at Ebb Tide' (1901).

NEREUS, nēr'ē-ūs, in Greek mythology, a divinity of the sea, the progenitor of the Nereids (q.v.). He is represented as an old man, with a wreath of sedge, sitting on the waves with a sceptre in his hand. Although represented as always friendly to mortals and to gods, one memorable contest is preserved in tradition. Hercules had to wrestle with him, while he changed shapes many times, in order to learn the way to the Garden of Hesperides.

NERI, nā'rē, **Filippo de'** (known in English as Saint Philip Neri) founder of the order of Oratorians (q.v.): b. Florence, 22 July 1515; d. Rome, 26 May 1595. He was of noble family with rich connections, but his only aim in early life seemed to be that of self-discipline and the pursuit of learning. He deliberately sacrificed the favor of a rich uncle, who wished to make his nephew heir to his fortune, by secretly leaving him (1533) and taking up his residence at Rome as private tutor in a gentleman's family. He sold his books in 1538 and gave the price to the poor, and ever afterward devoted himself to the sick and to pilgrims. In 1548 he established the Fraternity of the Holy Trinity for the succoring of the sick and pilgrims, founding the hospice which later became one of the finest at Rome. He did not enter the priesthood until 1551 and in 1574, with Cæsar Baronius and other priests, he founded the Oratorians of which he was styled "Father" up to 1592. His congregation received the approval of Gregory XIII in 1575. He was the most popular saint in Europe since the days of Francis d'Assisi and of unprecedented independence and originality in his life and utterances. Göthe has styled him "a saint with a sense of humor." His motto was "spernere mundum, spernere se ipsum, spernere se spem." (Despise the world, despise self, despise if despised). He was canonized in 1622, and in 1726 the day selected for his festival was the anniversary of his death. His letters (1751), poems (Rime Oneste, Vol. VIII), have been published. Consult Gallonio, 'San Filippo dei Neri'; Reiching, 'Leben des heiligen Philippo de' Neri' (1859); Barnabei, G., 'Vita di San Filippo dei Neri' (in the 'Acta Sanctorum'); English translation of Bacci's 'Life' by F. W. Faber (London 1847; rev. ed., 2 vols., Saint Louis 1903); the modern biography by Cardinal Capecepatro (Naples 1879, English trans., 2d ed., London 1894); Faber, F. W., 'Spirit and Genius of St. Philip Neri' (London 1850); Wiseman (Cardinal), 'Panegyric of St. Philip Neri' (ib. 1856); 'Maxims and Councils of St. Philip Neri' (Dublin 1890).

NERINE, a genus of plants of the family *Amaryllidaceæ* (q.v.). The 10 species, which are all South African, are bulbous-rooted, have

narrow leaves which die down during the spring months, and leafless scapes which appear in late summer surmounted by umbels of strikingly beautiful six-parted flowers varying from scarlet through all tints to white, and seemingly covered with hoar frost. The most commonly grown species is *N. sarniensis*, the Guernsey lily. The bulbs should be planted in autumn in the greenhouse and given plenty of water and plant food until the leaves turn yellow when both may be gradually withheld, the pots laid on their sides, and the bulbs allowed to mature. In late summer, when the plants show signs of life, water may be given.

NERNST, nĕrnst, Walther, German physicist: b. Briesen, West Prussia, 25 June 1864. He was educated in the leading universities of Germany and in 1889 became lecturer in chemistry at Leipzig. In 1891 he was called to the chair of chemistry at Göttingen where in 1895 he established an institute for physical chemistry. His invention of the Nernst incandescent electric lamp has made him a prominent figure in the electrical world. He has written 'Theoretische Chemie' (1898); 'Ueber die Bedeutung elektrischer Methoden u. Theorien für die Chemie' (1901). See ELECTRIC LIGHTING.

NERNST LAMP. See ELECTRIC LIGHTING.

NERO, Lucius Domitius Ahenobarbus (after his adoption by the Emperor Claudius called Claudius Cæsar Drusus Germanicus), 6th Roman emperor: b. Antium (Latium), 37 A.D.; d. 68 A.D. He was the son of Gneius Domitius Ahenobarbus and Agrippina, the daughter of Germanicus. His adoption was due to the marriage of his mother with the emperor. Soon after, when only 16, he married Octavia, daughter of Claudius and Messalina 53 A.D. Agrippina wished to secure the succession to her own son to the prejudice of Britannicus, the son of Claudius. In this she succeeded, and Nero became emperor on the death of Claudius in the year following 54 A.D. His tutors were able men, Burrus, the prefect of the Prætorian guards, and the philosopher Seneca (q.v.). For a short time he gave a promise of reigning well and allowed himself to be guided by his instructors, but it was not long before he gave himself to the greatest excesses and cruelty. His first crime was the poisoning of Britannicus, 55 A.D., whom Agrippina, having quarreled with her son, threatened to raise to the throne in place of Nero. He next caused Agrippina herself to be put to death, 59 A.D. The most distinguished victims of his cruelty, beside Britannicus and Agrippina, were his instructor Seneca, the poet Lucan, and his wives Octavia and Poppæa Sabina. "My predecessors," said he, "did not know the rights of monarchy. People may hate me, if only they fear me." During his reign, in 64 A.D., a great conflagration took place at Rome, which lasted for six days and seven nights, and when thought to have been extinguished, broke out and burned two days more. During this fire the most beautiful monuments of art and of history were burned to the ground. Nero was commonly suspected of being the originator of the fire, with a view of having a real representation of the burning of Troy; and although this suspicion was admitted by Tacitus to be without

evidence and is regarded by modern scholars as almost incredible, it was so generally entertained at the time that Nero did his utmost to transfer the guilt of this action to the Christians, whom he caused to be cruelly persecuted for it throughout the empire. He caused the burned part of the city to be rebuilt in a manner more splendid and magnificent than before. The most remarkable of his buildings was the palace which he erected for himself in Rome, known as the Golden House. Several conspiracies, formed against him in Rome, ended in the destruction of the conspirators themselves. He aspired to distinguish himself as a poet, actor, philosopher, musician and liberal patron of the arts. At last the revolt of Galba, his governor in Spain, succeeded. The Prætorian guards declared for Galba, and the Senate pronounced against Nero sentence of death. The tyrant anticipated the punishment which awaited him through requesting death by the sword of an attendant. Consult Baring-Gould, 'The Tragedy of the Cæsars' (Vol. II, 1892); Tacitus, 'Annales' (XIII-XVI); Suetonius, 'Nero'; Schiller, 'Nero' (Berlin 1872); Henderson, B. W., 'Life and Principate of the Emperor Nero' (Philadelphia 1903).

NERO, Golden House of. See GOLDEN HOUSE OF NERO.

NEROLI, a perfume, extracted from the flowers of a small Italian orange tree. It is an essential oil, obtained by distillation from the orange blossoms.

NERTCHINSK, nĕr-chinsk', Siberia, a town in the Transbaikalia Territory, on the Nercha, near its mouth in the Shilka, 570 miles east of Irkutsk. Although comparatively small it is an important trading centre for Russians, Mongols, Turcomans and Tunguses, and has a considerable export trade in the gold, silver, lead, tin and zinc of the surrounding mining region. Pop. about 11,000.

NERTHUS, nĕr-thūs, in German mythology, a goddess, regarded as representing the earth. Her shrine has been supposedly discovered at Rügen.

NERVA, 13th Roman emperor: b. Narnia, Umbria, 8 Nov. 3 A.D.; d. 25 Jan. 98 A.D. He occupied posts of trust in the reigns of Vespasian and Titus. He became emperor at an advanced age, after the assassination of Domitian, 96 A.D. through the aid of Parthenius, chamberlain of the imperial palace, and Petronius Secundus, commander of the Prætorians. Nerva was a man of cultivated mind, with some poetical talent. His reign was beneficent. He recalled exiles, allowed no senator to be put to death, abolished several oppressive taxes, observed a strict economy for the relief of the poor and tolerated Christianity. But he was unable to put down the violence and insubordination of the Prætorian soldiers. Seeing, perhaps, that an element of greater energy was needful, he adopted, as successor, Marcus Ulpius Trajanus (see TRAJAN), then commanding an army in Germany, whom he made co-reign. Consult Merivale, 'History of the Romans under the Empire' (1865).

NERVAL, nār-vāl, Gerard de (properly GERARD LABRUNTE), French author: b. Paris, 21 May 1808; d. 26 Jan. 1855. He was educated at the Lycée Charlemagne, and made one

of the first renderings (1828) of Goethe's 'Faust.' In his 'Poésies allemandes' (1830) are to be found translations from other German authors, such as Schiller, Uhland and Heine. He was a collaborator on various literary periodicals; wrote verse, including 'Elégies nationales et satires politiques' (1827); a few dramas, among them 'L'Alchimiste' with Dumas; and several volumes of prose, such as 'Scènes de la vie orientale' (1848-50), and 'La Bohème galante' (1855).

NERVII, nêr'vî-i, an ancient people of Gaul, famous for the stand they made against Cæsar's advance in 57 and 54 B.C. They submitted to the Romans in 53 B.C.

NERVOUS DISEASES, disorders arising either from actual changes in the structure of nerve-fibres or nerve-centres, or from some irregularity of nerve-function without gross structural change. Thus nervous diseases may be due to inflammation or degeneration of nerve-substance; to the pressure on some part of the nervous system by tumors, effused blood or other fluid; to the death of some part by the cutting off of its blood supply, etc.; to accident or injury due to internal or external poisons or to violence; or they may be the result of lowered nervous action as a part of general bad health. It is customary to speak of organic and functional diseases of the nervous system, meaning diseases in which structural changes are demonstrable, and those in which no such alterations can be seen by appropriate instruments of precision. While such a difference is perfectly valid from the practical point of view, from the more scientific standpoint no such distinctions can be maintained save on the most general grounds. A much more useful classification is to subdivide nervous diseases into (1) Vegetative, (2) Sensori-motor and (3) Psychical Nervous Disorders. By vegetative nervous disorders is meant interferences with the functions of the vegetative or sympathetic nervous system. This includes a vast group of disturbances of the functions of the viscera of the body, including endocrinopathies, or diseases of the endocrine glands.

Among the more important of these endocrinopathies may be mentioned acromegaly, exophthalmic goitre, myxedema, Addison's disease, various types of idiocy and imbecility, and a great variety of defect states in general.

Sensori-motor nervous diseases include diseases of the peripheral nerves, of the cranial nerves, of the spinal cord, of the mid-brain and cerebellum and of the brain itself. This group includes the great majority of so-called organic nerve diseases.

Psychical nervous disorders may be roughly grouped into three large classes — the neuroses and psychoneuroses, the psychoses and the defect states of various types.

Nervous diseases are extremely widespread in the community. It has been estimated that one in every 300 of the population is afflicted with some one of the psychoses; one in every 500 has epilepsy, and it is common belief that the neuroses and psychoneuroses are on the increase. About one adult individual in every 10 has some form of a neurosis or psychoneurosis, mild or severe, as the case may be. Diseases of the nervous system are naturally increasing with the increasing population. Whether this

is a relative increase or not is not definitely proven. So far as the psychoses are concerned, there seems to be little doubt that they are not only relatively but absolutely increasing. With respect to this latter belief, however, it should be remembered that the increase in the material comforts afforded patients suffering from psychoses is tending to encourage the community to send their semi-dependent members to institutions and thus escape the individual cost of their care. This makes an apparent increase in the proportion of psychoses, for many cases in this manner enter into statistics which would not otherwise be counted. The complex conditions of modern civilization are causative in bringing about a certain amount of breakdown of the nervous system, and the keen competition for subsistence and for luxuries also tends to increase these evils.

Nervous diseases present a greater diversity of symptoms than disease of any other organ-system of the body. Over 200 divisions have been made, and this number is subject to constant revision. The nervous system is the most highly developed and most intricate part of the body; hence nervous diseases present a greater complexity than any others. At the same time, so far as nervous diseases are concerned, their accurate determination is a matter of very precise knowledge. This gives to the study of them a peculiar fascination. Nervous diseases are further characterized by their extreme severity. Other organs of the body, when diseased, recover their functions in a comparatively short time. Nerve-function, when disturbed, recovers very slowly. Chemically, nervous tissue is extremely complex and much time is necessary to reconstruct it after injury. This is particularly true for mental diseases. Years and months are necessary for recovery, when weeks and days are occupied in the restoration of non-nervous structures. Economically, nervous diseases are of serious effect, frequently depriving the community of wage-earners without eliminating them, so that they become burdens; and they continue to swell their own ranks by the added stress they cause to the community which must support them. The great majority of chronic invalids are those suffering from nervous ailments. Idiots, imbeciles, the insane, epileptic, paralytic and criminal make up a large class of parasites. The study of economic conditions due to disorders of nervous structures is of wide and practical import. It is the largest and most important chapter in social economics.

One of the most important agents in reducing the amount of nervous disease is hygienic living, and a greatly increased amount of general information bearing on the part played by alcohol and other poisons in the development of nervous affections. It is highly desirable that in the primary schools, high schools and colleges, more attention should be paid to the education that fits people better for the conditions with which they are to struggle in after years. Physical exercise, gymnastics, open-air play, nature-study, general rules of hygienic eating, of hygienic clothing and the general principles of preventive medicine should enter into the curriculum of every school for both sexes. All this is being provided for wisely in most of the communities of the

United States, and there is every reason to suppose that coming generations will be much better fitted physically to stand nervous stress than their predecessors.

Textbooks on nervous disorders are numerous. A few of the more important recent works are here mentioned. Reference works: 'Jahresbericht über die Fortschritte in der Neurologie und Psychiatrie,' the most important bibliographic work published. Nothnagel's 'Specielle Pathologie und Therapie' contains the most recent series of monographs bearing on nervous disorders. Broudel's 'Traité de Médecin' is one of the best recent French collections. Albutt's 'System of Medicine' is the best of the recent English systems. Valuable individual works on diseases of the nervous system are those of Gowers, Dejerine, Oppenheim and Jelliffe and White. On mental disorders Ballét's 'Traité de Pathologie Mentale' (1904) is one of the most comprehensive. Kraepelin, Weygandt and Ziehen are German authors in favor; White is an American authority; Maudsley, Mercier, Clouston and Bevan Lewis are among the foremost English writers of a generation past; Bianchi, in Italy, and Muratow, in Russia, are other well-known authors on nervous diseases. Consult Jelliffe and White, 'Diseases of the Nervous System' (1919). See BRAIN; MENTAL DISEASE; NERVOUSNESS; NERVOUS SYSTEM, EVOLUTION OF THE; NEUROSIS; NERVOUS SYSTEM, TRAUMATIC AFFECTIONS OF THE; PSYCHIATRY; PSYCHOSIS.

NERVOUS SYSTEM, Evolution of the.

The nervous system is that part of the body which has developed most particularly the function of adapting the different organs of the body to their environment. It is the great regulator of all the physiological processes. It may be said to consist of two parts, that portion which has to do with the reception of impulses from without, in general spoken of as the sensory nervous system, and that portion which, in response to the incoming impulses, causes some form of adaptation in answer. Such adaptations are often of a muscular character, and the motor-nervous structures are concerned in bringing about such relationship. The human nervous system is fundamentally arranged on this plan, but while theoretically so simple in organization, practically and anatomically it is an extremely complex and complicated series of structures. This complexity is the result of untold ages of development; but a study of the nervous system in a number of the lower forms of life, as well as the study of the various nerve-structures of man himself in their development from the fetal stage, has enabled the student of the human nervous system to trace the gradual steps of its evolution.

Plants are considered not to possess any nervous structures, yet the protoplasm responds to many forms of stimuli in much the same manner as the protoplasm of more highly developed living things. In a few plants, Venus' fly-trap, the sensitive plant, etc., there are found certain cells in the midribs of the leaf and in the stem, in which the protoplasm differs from that of other plants. They do not possess special nervous structures, but they are cells in which the protoplasm seems to possess special nervous conductive properties. In many of the lowest animals no known nervous structures

have been found, but even in the very simplest animals the prototypes or forerunners of human nerve-structures are known to occur. In these animals the simple nerve-unit or neuron is found. In its simplest form this neuron consists of a strand of nervous tissue, a nerve-fibre, in some portion of which an enlargement or nerve-cell (so called) occurs. From the nerve-cell (or station, as it were) the fibre usually passes out in two directions, becoming attenuated in its passage and, branching or not, finally terminates in extremely fine processes (dendrites), which in different animals widely vary. One branch of this neuron is usually found in the periphery of the animal body, and may be spoken of as the incoming or sensory part of the structure; the other is frequently distributed to the muscles of the body. As the animals rise in the scale of complexity this most primitive condition becomes modified, and a neuron of distinctly sensitive nature develops, which is brought in contact by the end-filaments of the neuron-branches with a similar motor neuron.

Such simple arrangements are found in animals of the very lowest organization, polyps, sponges, etc. In higher animals collections of these neurons form ganglia. These ganglia, at first isolated, become co-ordinated and grouped until as in the insects, for instance, a double chain of ganglia is found from in front of the mouth to the anus, arranged along the abdomen. These ganglia are connected by cables of nerve-fibres, and to and from each ganglion sensory and motor fibres pass, and thus the entire nervous system is brought into co-ordination. In thought it is but a step from the ventral double chain of ganglia in the insects to the solid spinal cord of the mammals with its ganglionic enlargements, constituting the medulla and brain (see BRAIN), but it has taken many ages to bring about this integration. Theoretically, the nervous structure of the lowest mammals, *Amphioxus* and *Petromyzon*, are of the simplest type, a trifle more advanced than the insect double chain; but in the study of the nerve-structures of these lowest forms glimmerings of the complex nervous system of man are to be found. The homologues of the much diversified and complex spinal cord and brain in man are present in the primitive conditions in these animals.

While the development stages of the growth of the nervous system to its present complexity may be thus summarized, the details of the different forms are intricate, and only on philosophical grounds can they be thus described. In the lowest *Infusoria* there are few if any nerve elements known. In the bell-animalcules (*Vorticella*, *Stentor*, etc.), a mixed form of neuromuscular cells is found. These possess the combined functions of these two types of tissue. In the sea-anemones and polyps similar nervous structures are found and small ganglionic masses are present. Starfish possess a comparatively complex nervous system. Each arm of the starfish has a small ganglion near the mouth, and a nervous cord passing down the arm. The ganglia are farther connected by special nerve-fibres, bringing about an integration of nervous impulses. In the mollusks (snails, oysters, clams, etc.), the nervous system consists of a ring of ganglia surrounding the esophagus; one above is larger and by some is

spoken of as a brain, but it is not homologous with the brain of mammals in any sense. Communicating fibres pass to the foot and to the breathing apparatus. In the worms the nervous system is still more complex. An enlarged double bilateral ganglionic mass at the head of the animal constitutes the brain; special offshoots pass to nervous structures in the eyes on each side; double cords pass backward, connecting the brain with paired ganglia, which may be fused into one mass or may be separated and connected by commissural fibres. From the ganglionic enlargements fibres pass out to the periphery of the body. This form of nervous system represents in skeleton what the more complicated mammalian system is to become. It is bilateral and is segmented, or metameric. The bilateral character of the mammalian nervous system remains throughout, with but slight fusion; the metameric character, however, undergoes many changes by the fusing together of ganglionic masses and their later distortion. The separate ganglionic mass in the worms entails greater individual independence. Thus if the head of a centipede be cut off, the legs will still cause the animal to run. Ants, flies and butterflies will move about aimlessly for some time after the head is cut off. The head-ganglion in the ant is much more complex than in many other insects, showing in some measure by its structure the more highly developed character of this animal's "brain-ganglion."

The transition from lower to higher types of nervous system is found in one of the lowest of the vertebrates, the *Amphioxus*. In the lower forms the ganglionic masses and their connecting cords are located for the most part in the lower or ventral portion of the body, and the ganglia and fibres are distinct. In the vertebrate type the nervous system becomes dorsal, and the ganglia and fibres become fused into a long cord, or cerebro-spinal axis, which lies protected in the bony cavities of the skull and spinal cord. Certain accumulations of ganglionic centres occur and give a varying form in the different animals, and throughout the entire cerebro-spinal axis there runs a small cavity. In the head, or cephalic end, the brain is located, the ganglion-cells, or gray matter, being usually situated on the outside of the mass, the connecting and collecting fibres, white matter, on the inside. In the lower or cord portion, the gray masses come to lie on the inside of the structure and are partly surrounded by the fibres (see SPINAL CORD). The ganglionic masses in the cord remain isolated, but much shifted in their position, coming to assume in the highest types the character of rods or pyramids of gray matter embedded in the cord. From the entire nerve-axis fibres pass out and are regularly paired, bringing all parts of the body into close nervous contact by intercommunicating nerve-fibres. In *Amphioxus* only the foreshadowings of the arrangements in higher vertebrates may be seen, but the work of Edinger, Kupfer, His, Retzius and others has shown that most of the structures of the higher animals are found in this low animal in their simplest forms. In the fishes the brain-hemispheres begin to show more advanced stages. The olfactory nerves and bulbs are very prominent. The optic lobes are small, and the presence of a cerebellum is only indicated. In the amphibians, frogs, toads,

salamanders and the reptilians, snakes, etc., the hemispheres are prominent, and a certain degree of complexity of their minute anatomy is evident. The olfactory lobes are still very large, the cerebellum is very poorly developed and the spinal cord is extremely simple in structure. The pyramidal tracts are not yet characteristic, but fibre-systems are present, passing from the brain to the cord. The spinal cord remains, however, a somewhat independent organ. In the fishes a sensory spinal fibre-system is probably found. With the birds the more characteristic higher-type brain begins to show itself. Its hemispheres have convolutions resembling somewhat in type those of higher forms. The cerebellum is well developed, and shows the characteristic histological structure of more highly evolved animals. The spinal cord has well-marked pyramidal motor tracts and a differentiated sensory tract. Finally in the mammals practically all of the structures of the human brain are present, although great variations in the size and complexity of the different parts are to be noted. The brain of man differs from that of the lower animals not so much in the matter of size or weight, although it is relatively large and heavy, as by reason of the almost infinite number of connecting or association fibres. These bring all parts of the nervous system into relation, and permit of the endless variety of thought-constructions that go to make up man in his social conditions. In man, moreover, the hemispheres become relatively much larger than the other parts of the brain, and by reason of their many fissures and convolutions make very wide areas in which countless nerve-cells develop. These hemispheres lie over the other parts of the brain. Throughout the entire animal series a certain evolution in localization takes place. Functions which in lower forms are generalized, and can be assumed by any part of the nervous system, in higher animals become specialized, and are relegated to certain particular organs. Thus it is found that in animals in which the sense of smell is extremely important large olfactory lobes are present; and conversely, animals so situated as not to possess certain organs do not develop certain nervous structures. The eyeless animals of caves have usually small optic lobes; the footless dolphins show small pyramidal (motor) tracts in their spinal cords, etc.

In the nervous system are illustrated very thoroughly the general principles of evolution as seen in its broadest aspects, and the development of the richly convoluted and highly complex brain is the index of the superior mental power of the human race. Consult Beaunis, 'L'Evolution du Systeme Nerveux' (1890), which gives a simple account of the general structural changes in the nervous system throughout animals; Parker, 'The Elementary Nervous System' (1918); Cajal, 'The Nervous System' (trans. by Azoulay); Koelliker, 'Handbuch der Gewebelehre des Menschen' (1896), for minute anatomy. For the most comprehensive works on the human nervous system, Dejerine, 'Anatomie du Systeme Nerveux' (1900); Van Gehuchten, 'Anatomie du Systeme Nerveux'; Barker, 'The Nervous System'; Winkler, 'Manual of Nervous System'; Jelliffe and White, 'Diseases of the

Nervous System' (1919). See ANATOMY; BRAIN.

Editor, *Journal of Nervous and Mental Disease.*

NERVOUS SYSTEM, Traumatic Affections of the. Accident and injury play a large rôle in the development of affections of the nervous system. The Great War has given rise to an enormous number of these traumatic disturbances. These forms of disease, or disorder, may be grouped under two general heads, organic affections and psychogenic affections, the dividing line between some forms of each being very obscure. Affections of the peripheral nerves are among the commonest of the organic accidental injuries. Thus, pressure of a crutch under the arm, the use of the crutch being necessitated by a broken leg, often produces a paralysis of the muscles of the arm. Other forms of peripheral palsies result from wounds of the arm and forearm whereby a nerve is cut, either by an instrument that penetrates the skin or by a splinter of bone from a fractured limb. Paralysis of one half of the body (hemiplegia) sometimes follows severe injury to the head. Such injuries frequently result from football accidents, from falls during drunkenness, from collisions, from shell explosions, from bombs, from machine gun bullets, being thrown from a horse or vehicle, etc. Fractures of the spinal column often result in death, due to injury of the spinal cord; and if death does not result immediately, paralysis of the entire body below the site of the fracture (paraplegia) results. Lesions of the nervous system resulting from gunshot injuries are very common in times of war and constitute a very important chapter in military surgery. Such injuries usually cause either paralysis of different parts of the body, resulting from division of the nerve-fibres, or severe neuralgic pain due to irritation of the sensory nerves. Occasionally epilepsy is caused by accidental injury to the head, especially injury to the child's head during birth. One of the most interesting chapters in the history of traumatic affections of the nervous system is that of "traumatic neurasthenia," or "traumatic neuroses." These have been frequently classified under the head of "spinal concussion," "railway spine," "Erichsen's disease," etc. During war times they are called shell shock, or war neuroses. The most characteristic features of this affection were pointed out by Charcot, who allied it with neurasthenia and hysteria; and at the present time it is usual to speak of three classes of these conditions: (1) affections of a purely surgical nature; (2) traumatic hysteria; (3) traumatic neurasthenia. In a severe railway accident, for instance, any one of these forms may be present, and combinations of two or three are not unusual. The neurasthenia which may arise from such accidents is of a nature precisely similar to neurasthenia due to other causes. It is characteristic, however, that many of these neurasthenics recover when damages are collected from the railroad; some, however, persist and there is no doubt that the affection is a real one in most instances, and not simulated. At the same time, it should not be forgotten that many people grossly exaggerated their symptoms; moreover, there are certain parasites in the com-

munity who make it a business to sue railway and other corporations on the basis of alleged traumatic disease. Hysteria resulting from traumatism is of the same nature as ordinary hysteria, and is governed by the same general laws of this disease when due to other causes. It is important to emphasize the fact, not only to the layman, but to the professional man, that traumatic neurasthenia and traumatic hysteria are real diseases, and that their consequences may be serious and disabling. Each case needs special treatment, and in all cases in which litigation occurs there should be thorough investigation by competent medical experts, as well as by trial by jury to determine the degree of disability on its merits. Consult Hamilton, 'Railway Injury'; Jelliffe and White, 'Diseases of the Nervous System'; Bailey, 'Accident and Injury,' and numerous volumes on War Neuroses, all collected in bibliography of the Mental Hygiene Society of New York.

NERVOUSNESS. If one were to ask half a dozen persons calling themselves nervous to define what they mean by their nervousness, he would find it hard to get thereby a general and comprehensive definition, for each would fail in describing his particular variety of nervousness. The nervous business man feels in a perpetual hurry. He is impatient and restless while waiting for his car or for his luncheon. He eats quickly, talks rapidly and when he has a chance to rest he fidgets. At night he tosses and thinks for an hour or two before sleeping; but, instead of thinking consecutively his ideas flash around in a distracting circle that leads to no conclusion. The nervous woman of leisure starts at the slightest noise; she feels bright and like herself during any exciting pleasure, but has the blues and is morbidly depressed when life is dull. She has headaches and moods in which she wants to scream. The overworked nervous student broods over his studies, cannot fasten his attention on his work, and what he has once known well he fears he has forgotten, and he expects to fail in his examinations. The young girl who is nervous about playing or reciting before an audience finds that her heart beats furiously; her hands are icy and stiff, and when she sits down at the piano the notes dance wildly before her eyes. The nervous mother or housekeeper is troubled by her irritability. She is distracted, forgets where she puts things and cannot remember what she started to do. At night she excuses her "good cry" as relief to her nerves.

All such people agree that nerves are the bane of modern civilization, and it seems to be taken for granted that nerves are a new development of the human anatomy. When national comparisons are made, Americans will generally admit, in fact claim, that they are the most nervous of nations. To be nervous seems to imply the possession of a finer sensibility, a greater responsibility in affairs and a more strenuous and enviable mode of living. Hence the afflicted dwell with relish upon their symptoms, with a lurking contempt for such as do not manifest the like.

To have nerve, however, is quite a different thing from having "nerves." Nerve implies the ability to bring all one's powers under control of the will, to keep steady in trial and danger, calm when others are in panic, and buoyant

through any crisis. This modern use of the word nerve and the common supposition that the nerves which play such pranks with man's mind and temper and disposition are all in some way under control of the will illustrates the vagueness of general knowledge concerning the nervous system and its relation to nervousness.

The absolute control of man's nerves is no more a thing of his will than is the growth of a plant. The power that he calls his will is but the steadily directed training of portions of his nervous system to act in a desired way according to certain decisions. The most pitiful sight in life is a man who "has no will," who has noble impulses and high desires with no disciplined nervous machinery to carry them out. The men and women who are known to have that will power which carries them through ordeals, and who are productive in their activities, are those who have been accustomed to "do noble things, not dream them all day long." As all success in life, as well as every pleasure of mind or body, depends on a well-conditioned nervous system, it is a matter of highest moment to know how to preserve, train and care for one's "nerves."

Not every man is born equal in his nervous equipment. Some inherit an excellent nervous system, which they may dissipate with unwise living, or may husband and improve. Others have very little vigor of the nervous system, but by careful training and right living they spend only what nervous force they can spare. With a poor heritage, in the strenuousness of city life, and sharing the prevalent ignorance concerning the nervous forces, a man may feel that by excessive work he is making a brave and noble struggle to succeed, when in reality he is spending his nervous capital, and at 40 will be a wreck.

Every spoken or written word, every plan, every carefully executed order that takes thought, every act of attention and every bit of creative work means direction of energy. Rest, sleep, recreation, and pleasing work enable the nervous system to renew in a few hours all that it has lost, with ability gained to do the same kind of work the next day with less of voluntary effort, and consequently less fatigue.

The slowly accumulating nervous power that shows itself in increased accuracy and judgment makes men successful and prevents nervousness. Too many girls and boys, in their student days, in their social or university careers, in their early business ambitions, are so anxious to succeed quickly that they spend more of their nervous capital than can come back to them in the time allowed for sleep and recreation, until finally they find themselves nervous bankrupts. "Time is money" may well be paraphrased, "nerves are money," and they are also power and success.

In no part of the body are the effects of heredity so marked as in the nervous system, but most conclusions regarding this are based on *post-hoc* reasoning. It can never be shown that, because two highly nervous, excitable or hysterical persons marry, their children must have the same strain; for a healthful environment and good physical and mental training can overcome the tendency to lack of nervous control. Neither can it be assumed that the children of two calm, well-balanced persons, of good nervous force, will grow up to be like

their parents; for disease, overwork and dissipation may ruin the best nervous organization. The chances are, however, that the same environment and training which have helped to exaggerate the nervousness of parents will also surround and affect their children, as it is equally probable that the wise and healthful training which has developed good nervous stock in parents will be passed on to their offspring.

Neurologists term this inborn tendency in the nervous system to give way under stress the neuropathic tendency, or nervousness. They mean that, while no actual nervous disease is inherited, yet under the stress of habits and environment the nervous system fails to meet the demands made upon it. A man with this neuropathic tendency who drinks even moderately usually becomes nervous and less capable, where another might suffer almost no ill effects. Two students may smoke cigarettes incessantly, and one develop shaky muscles, an irritable heart, dyspepsia and nervous breakdown; the other feeling no ill effects. A certain percentage of telegraphers, typewriters, writers with the pen, pianists, tailors, ballet-dancers, etc., develop occupation-neuroses with muscular cramps and consequent disability, by reason of the extra burden put upon a deficient nervous inheritance.

The inheritance of a sound nervous organization means that a child is born with sufficient nervous energy to control its body and not so much as to stimulate it to excess. Perfect health in a mother during pregnancy means a valuable asset for her child's nervous system. Shock, fatigue, infectious disease in the mother may even stop the child's nervous development, and cause the babe to be born an imbecile. A normal infant at birth has the mechanism of its nervous system definitely laid out though wholly undeveloped. All growth comes through repeated experiences, which begin with the first day of life, and on that day the training of the nervous system should begin. Clock-like regularity in the hours of eating and sleeping is the first step in the healthful training of an infant's nervous system. By control of the involuntary start on hearing loud sounds, a child may be so trained as to be spared much nervousness when he grows up. Parents, by word and example, should teach their children to work with concentrated attention in spite of distracting sounds. It is the total lack of training that makes it impossible for so many nervous people to inhibit their reflex actions. They tremble, shudder, start, exclaim, are disturbed in their work, wakeful at night, simply because they have always allowed their nerves to respond to trifling stimuli, instead of inhibiting the responses. All mechanical actions, all brain actions tend by repetition to become automatic. The muscle-worker rarely suffers from nervousness. But in the brain-worker the establishment of new connections bring great nerve-tire. So the expenditure of nervous energy in forming new nerve-connections, receiving new impressions, etc., tends to make the most agreeable occupations exhausting. Let it be remembered by the older generations, and taught to the younger, that the training and directing of nerve-force are vitally important to health and efficiency, and that the great workers achieve their ends by that very quality of well-directed

energy which, if dissipated, degenerates into nervousness. See PSYCHONEUROSES; NERVOUS DISEASES.

NESBIT, něz'bit, E. See BLAND, EDITH NESBIT.

NESR, in Arabian mythology, an idol in the form of a vulture, worshipped by the tribe of Hemyer.

NESS, Loch, lõh nēs, Scotland, a lake of Inverness-shire, on the line of the Caledonian Canal. It is long and narrow, stretching southwest and northeast about 22 miles, with a fairly uniform breadth of about a mile and a maximum depth of 780 feet. Its northeastern extremity is about six miles from Inverness. Fort Augustus is situated at its southwest end. It occupies the centre of the valley of Glenmore and is enclosed by steep and often finely wooded hills, about 1,000 feet high. The outlet is by the Ness into the Moray Firth.

NESSELRODE, nēs'sěl-rō-dē, Karl Robert, COUNT, Russian statesman: b. Lisbon, 14 Dec. 1780; d. Saint Petersburg, 23 March 1862. His father was Russian Ambassador to Portugal, and the son also, at an early period, entered the diplomatic service, and in 1807 was made councillor of the Russian embassy at Paris. He succeeded in detaching Russia from the Austrian alliance and was present at the important conferences between Napoleon, Alexander I and the German princes, at Erfurt in 1808. He gained immense influence over Alexander's mind; was made chancellor of the empire, and dictated its foreign policy; followed the emperor to France in 1814 and signed the Quadruple Alliance; and took part in the Congress of Vienna. He was one of the chief formers of the Holy Alliance, which made Russia virtually supreme in Europe. He became Minister of Foreign Affairs in 1816 and took part at the congresses of Aix-la-Chapelle, Troppau, Laibach and Verona. Nesselrode's influence was considerably limited under Nicholas I and he strove in vain to avert the war which broke out in 1853. After the accession of Alexander II and the signing of the Treaty of Paris in 1856, Nesselrode retired from the Foreign Office, but continued in the Chancellorship, and also held a seat in the Ministerial Council. His autobiography appeared in 1866.

NESSUS, nēs'ūs, in Greek mythology, a centaur whom Hercules ordered to carry his wife, Deianira, across a river. The centaur ill-treated the woman, and Hercules shot him with a poisoned arrow. Nessus, in revenge, gave Deianira his tunic, saying whomsoever she gave it to would love her exclusively. Deianira gave it to her husband, who was poisoned and, after enduring agony, threw himself on a funeral pile and was consumed.

NESTOR, Russian monk and author, of the 11th century. He was of the Cave Monastery at Kiev, and wrote an account of the martyrs Boris and Gleb, and a 'Life' of Theodosius, a former abbot of his monastery. For a long time he was regarded as at least the original author of the so-called 'Chronicle of Nestor,' the most important of the early authorities for

Russian history, but later investigations have proved the supposition erroneous. The 'Chronicle,' perhaps the work of Abbot Silvester, gives an account of Slavonic history in the form of annals for the period 850-1110 A.D., the last 40 years being from a contemporary viewpoint. For the preceding time, use is made of the Byzantine historians, the Bible, the Apocrypha, traditions, biographies and legends of saints and the records of monasteries, etc. There are various translations into German by Schlözer (as far as 980 only); in his 'Russische Annalen' (1802-09); into French by Léger (1884).

NESTOR, in Greek legend, one of the heroes at Troy distinguished for his great age, experience and wisdom as well as for his mild and persuasive eloquence. These are the qualities Homer has attributed to him in the 'Iliad.' He was the son of Neleus, king of Pylos, and was born in Gerenia, in Messenia. He succeeded his father as king of Pylos. In his youth and manhood he distinguished himself by many bold exploits, and early acquired the reputation of a prudent counsellor and persuasive orator. Though he had lived through two generations when the expedition to Troy was undertaken he nevertheless took part in it, and conducted the forces under his command in 20 vessels to Troy. On account of his extreme age he did not take a personal action in the encounters before the city. The part which is attributed to him in the 'Iliad' is that of an experienced counsellor. He had several sons and daughters, but they are not distinguished in history. After Nestor had outlived three generations he died quietly at Pylos, where, in the time of Pausanias, the inhabitants pretended to distinguish his dwelling and his grave.

NESTORIAN MONUMENT, a famous archaeological stela, known locally as "Ching-chiaopi," erected in 781 A.D. at Sian-fu (q.v.) in northwestern China. It records the introduction of Christianity in the Celestial kingdom by Nestorian missionaries in A.D. 631, under the name of the "Luminous Doctrine." This celebrated tablet was erected at the zenith of Nestorian Christianity in China. It disappeared during the political and religious upheaval under the Emperor Wu-tsung about 845, which laid the city in ruins, and also marked the decline of Christianity in China, although in the 13th century Marco Polo refers to Chinese Christians as still maintaining their faith. In 1625, workmen digging in the Chang-ngan suburb uncovered the valuable record and it was restored by Father Semedo, S.J. The first translation of the inscription was published by Father Kircher, S.J., in 1636. Doubts as to its authenticity raised, among many others by Voltaire and Renan, and the charges of a "pia fraud"—a pious fraud, laid to the Jesuit brotherhood, were disproved by Père H. Havret, S.J., in his exhaustive work, 'La Siècle chrétienne de Si-ngan-fou' (1895). The stela, which is 10 feet high and weighs two tons, was re-erected embedded in a brick niche, and long stood as one of a row of five memorial tablets, exposed to the atmosphere, in the enclosure of a ruined temple. About 1891 a shed was built above it, but in 1907 the priceless monument was entirely unprotected when the Danish explorer, Fritz von Holm, visited Sian-fu to try

Photograph presented by Dr. Frits von Holm

THE ORIGINAL NESTORIAN MONUMENT OF A. D. 781

The picture represents the monument as it now stands, protected and under roof as a result of THE HOLM-NESTORIAN EXPEDITION TO SIAN FU, 1907-1908, in the "Peilin" ("stone coppice") of Sian-fu near the south gate. The priceless monument was practically exposed to wind and weather from A. D. 1525, when it was found, till 1907, when the Danish explorer, Dr. Frits v. Holm, M.R.A.S., visited it and had a limestone replica made. The tablet is 10 feet high and weighs two tons. The replica is in the Metropolitan Museum of Art in New York city

and procure the tablet in the interest of science, In this he was unsuccessful, but he obtained a perfect limestone replica, which was brought to New York and placed as a loan in the Metropolitan Museum of Art. In 1917 it was placed in the Lateran Palace, Rome. The local mandarins caused the original tablet to be removed to the 'Peilin,' an historical museum of stone records near the south gate of the city, where it now stands safely protected under roof.

The inscription consists of more than 2,000 characters, Chinese and Syriac or Estrangelo. It records (a) an abstract of Christian doctrine; (b) the arrival in 631 of Nestorian missionaries; how in 636 they were allowed to settle at Ch'ang-an, the ancient name of Sian-fu; that in 638 an imperial decree was issued stating that Olipán, described as a Persian priest from Tats'in, bearing sacred books and images had arrived in 635; that he had presented a form of religion which his majesty the Emperor T'ai-tung, an eminent ruler, had closely examined and had found to be satisfactory in every particular; that henceforth it would be permissible to teach this new doctrine within the boundaries of the empire. The establishment of a church and monastery to be served by 21 priests, built in the "Ining fang—the court of justice and peace," was authorized. The emperor's portrait was to be placed in the church. A description of the emperor's virtues and of the work of the church is added. The Syriac portion which brings the tablet to a conclusion gives the name of the reigning Nestorian patriarch, Man Hanan Ishua, that of Adam, bishop and pope of China, the names of the clerical staff and of 67 persons, including 61 in Chinese, the majority designated as priests. Consult Holm and Carns, 'The Nestorian Monument' (Chicago 1909); Legge, J., 'The Nestorian Monument of Hsi-an-Fu' (London 1888); Parker, E. H., 'Studies in Chinese Religion' (London 1910); Yule, H., 'Cathay and the Way Further' (2 vols., London 1866); William, S. W., 'The Middle Kingdom' (London 1883); Williamson, A., 'Journeys in North China' (London 1870).

NESTORIANISM, the theory of the Incarnation of Jesus Christ taught by the Nestorians or followers of Nestorius. Nestorius was a presbyter of Antioch who in 428 was made patriarch of Constantinople and was charged with teaching that there were two persons in Jesus Christ, of which one is the word of God, and the other the man Jesus, and that Mary his mother ought not to be styled mother of God (Theotokos) but mother of Christ (Christotokos). Cyril, patriarch of Alexandria, accordingly accused him of teaching the dual personality of Christ, a view which was formally condemned and anathematized by the Third Council of Ephesus, 431. He was deposed, driven from one place to another and died in obscurity in 440. The controversy lasted for two centuries. In 435 the Nestorians who had organized themselves into a church in Syria took refuge from the persecutions of the Orthodox church in Persia, Mesopotamia and Arabia, assuming the title of Chaldean Christians. At the Council of Seleucia (498) the Persian Church clearly formulated this dogma in opposition to the teaching of the Catholic Church. These views flourished in Antioch, Edessa and Nisibis and their adherents were

the fosterers of learning in history, philosophy and medicine and under the Arabian domination were often raised to high posts in the government. It spread even to China where a monument of the 7th century bears testimony of its existence. The Moslems treated the Nestorians with much toleration, probably as a means of keeping up a division of Christianity in the East. Nestorianism reached its most important period in the 13th century when it numbered 25 archbishops and about 200 bishops. The Catholicus was an important rival of Rome. With the fall of Bagdad in 1258 the Catholicus, as the head of the Nestorian Church is called, was driven from place to place, church organization was disrupted and discipline was maintained with ever-increasing difficulty. Tamerlane in the 14th century desolated the Nestorian Church throughout almost all Asia so that only a remnant escaped to the mountains of Kurdistan. Under Popes Alexander III, Innocent IV and Nicholas IV some attempt was made in the 16th century to effect a union with the Roman Church in consequence of which the United Nestorians separated from the main body of the Chaldean Christians. These separatists (Uniat) are numbered at some 100,000, with 150 churches and 150 priests. They acknowledge the primacy of Rome but use a Greek liturgy and retain clerical marriage. Their patriarch has his see at Diarbekir, Asiatic Turkey. They are usually called Uniat-Chaldeans. The Non-United Nestorians in Mesopotamia, Persia and Syria celebrate the sacrament of baptism and the Lord's Supper but do not teach Transubstantiation; they number some 150,000 souls with about 300 churches, 12 bishops and about 250 priests. The Nestorians of India are called Christians of Saint Thomas; in 1599 a little more than half their number acknowledged the primacy of the Roman see. These Uniat number about 200,000. The India Non-Uniat number about 150,000 at the present time. Consult Assemani, 'Bibliotheca Orientalis' (Vol. III, Rome 1728); MacLean and Brown, 'The Catholicus of the East and his People' (London 1892); Hore, A. H., 'Students' History of the Greek Church' (ib. 1902); Adeney, W. F., 'The Greek and Eastern Churches' (New York 1908); Schaff-Herzog, 'Encyclopedia of Religious Knowledge' (Vol. VIII. ib. 1914); Wace and Piercy, 'Dictionary of Christian Biography and Literature' (Boston 1911); Badger, 'The Nestorians and their Ritual' (2 vols., London 1852); Rae, 'The Syrian Church in India' (1892).

NESTORIUS. See **NESTORIANISM**.

NESTS OF BIRDS. See **BIRDS**, **NESTS OF**.

NET, an open fabric made of hemp, jute, flax and sometimes of cotton and other fibres. The open spaces are called meshes and in order that these may retain their shape and size the fibres of which the net is made have to be knotted at the intersections. Nets were formerly made only by hand, but an ingenious kind of loom has for many years been in use by which the operation of netting can be performed mechanically. Nets are used for a great variety of purposes, but chiefly for fishing. The three chief kinds of nets used in fishing are the seine, the drift-net and the trawl. The first two are very long in proportion to

their breadth and differ from one another only in the manner in which they are employed. The seine has a line of corks along one of its long borders and a line of leaden weights along the other; so that when the net is thrown into the water it assumes a perpendicular position. The drift-net is not loaded with lead, but floats in the water. The trawl, again, is dragged along the bottom by the motion of the boat. Nets are also used to catch birds and animals, to protect crops from birds, the blossoms of trees from frost, etc. Wire nets or netting is also used for domestic purposes.

NETHERLANDS, Kingdom of the, frequently called **HOLLAND**, a northwestern European country with a north and western coastline of 470 miles on the North Sea, its eastern frontier bounded by Germany and its southern by Belgium. It comprises the northern and smaller half of the numerous provinces formerly combined under the name **NETHERLANDS** or **LOW COUNTRIES**, part of which is now included in Belgium. It received its general English name of **HOLLAND** from its coastal provinces North and South Holland. From north to south the country has an extent of 150 miles, with a breadth from west to east of 120 miles throughout and a total land area of 12,582 square miles.

Political Divisions.—The Netherlands at the present day has nearly the original limits of the Seven United Provinces in the 16th century. The modern provinces are given in the accompanying table:

PROVINCES	Area in sq. miles	Population 1916
North Brabant.....	1,920	699,838
Gelderland.....	1,939	707,898
South Holland.....	1,131	1,599,164
North Holland.....	1,066	1,244,499
Zeeland.....	707	243,698
Utrecht.....	525	320,913
Friesland.....	1,243	380,526
Overijssel.....	1,295	426,010
Groningen.....	881	355,154
Drenthe.....	1,028	196,505
Limburg.....	847	409,022
	12,582	6,583,227

The duchy of Luxemburg (q.v.) was under the sovereignty of the king of Holland, until the death of William III in 1890 dissolved this union. The most densely peopled province is South Holland (981 per sq. m.), and the least densely peopled is Drenthe (144).

Topography and Physical Features.—The Netherlands forms the most characteristic portion of the great plain of northern and western Europe. From the middle of Belgium, a few miles northeast of Brussels, the country becomes a dead level, extending in monotonous sandy flats through Hanover, Jutland, Holstein and with little interruption through Prussia into Russia. The lowest part of this immense level and that which has most recently emerged from the sea is the country lying between the mouths of the Schelde and Ems. Within this distance the Rhine, joined by the Maas, Yssel and other rivers, enters the sea through a number of arms and sluggish, winding channels. This delta in early ages was evidently liable to

perpetual change of form, as new mud-banks were deposited, old channels being blocked up and new ones formed. In addition to this the river floods, in forming a domain of alluvial deposits, had to contend with the sea, which washed away the accumulations of mud or covered them with sand, according to the vicissitudes of weather and season. The soil of the Netherlands shows everywhere the proofs of this struggle between the ocean and the river, in the alternation of salt and fresh water deposits. It therefore became a problem of existence with the early inhabitants to secure the natural permanence of their territorial possessions, by embankments high and strong enough to protect them under ordinary circumstances from the waves; by windmills on the embankments—a characteristic feature of Dutch landscapes—they worked the pumps which drained the enclosed lands. In consequence, the Netherlands has the appearance of an artificially constructed country, some portions of which are 16 feet below the surface of the sea and nearly all too low for natural drainage. The whole country is divided by dikes, some of them 60 feet high, which protect portions of land from the sea, lakes or rivers. These enclosed lands are called *polders*. On the chief dikes are roads and canals also joining the rivers, the canals generally large enough to be navigable. There are no mountains nor rocks in the Netherlands, which is popularly described as a country without mountains, wild trees or natural springs. The only heights are the sand-hills, about 100 to 180 feet high along the coast of Holland; and a chain of low hills, of similar origin, perhaps, which extend from the middle of the province of Utrecht into Gelderland.

The principal coast features are the wide estuaries of the Schelde and of the Maas, the latter receiving the waters of the Rhine; north of the Maas the Zuider Zee, which was formed by an irruption of the sea in the beginning of the 13th century and now covers an area of 1,200 square miles. Between the mouths of the Maas and the entrance of the Zuider Zee, a distance of 75 miles, the coast is chiefly formed of sand-hills or dunes, frequently 180 feet high, dreary and sterile to the last degree; and separating, with their broad band of irreclaimable desert, the low fertile meadows on the one side from the waves of the ocean on the other. In a line with these dunes, stretching beyond the mouth of the Zuider Zee, runs a chain of islands, namely, Texel, Vlieland, Terschelling, Ameland, etc., which seem to indicate the original line of the coast before the ocean broke in upon the low lands. The coast of Friesland, opposite to these islands, depends for its security altogether on artificial embankments. The Lauwers Zee, a deep bay on the confines of Friesland and Groningen, also owes its origin to an irruption of the ocean; and again the Dollart, a gulf at the mouth of the Ems, between Holland and Germany, was formed about half a century later than the Zuider Zee and by a similar convulsion, which is said to have swept away 70 villages and 100,000 people. From the left bank of the Ems extends the Bourtang morass, a vast and irreclaimable peat marsh, partly in Germany, partly in Holland; the Peel, a marsh of like nature but less extent, lies near the left bank of the Maas,

on the east side of North Brabant. The work of reclaiming the waste is constantly going forward; in the provinces of North and South Holland alone about 90 lakes have been drained. The principal of these was the Lake of Haarlem, the drainage of which, begun in 1839, was completed in 1852. The draining of large portions of the Zuider Zee has been begun.

Hydrography.—The chief rivers of the Netherlands are the Rhine, Maas, Schelde, Yssel, Vecht and Hunse. The Rhine is above half a mile wide where it enters the Netherlands; it soon divides, the south and principal arm taking the name of Waal and uniting with the Maas, while the north arm, communicating with the Yssel, takes the name of Leek; a branch from it named the Kromme (crooked) Rhein, winds by Utrecht to the Zuider Zee, while another very diminished stream called the Old Rhine flows from Utrecht by Leyden, to the sea at Katwijk. The Maas, entering the Netherlands from Belgium, receives the Roer; of the Schelde only the mouths, the east and the west, or Old Schelde, lie within the Dutch boundary. The Yssel and Vecht, flowing from Germany, both enter the Zuider Zee by mouths at no great distance asunder. The Hunse, rising in the Bourtang Marsh, flows through Groningen to the Lauwers Zee. The canals of the Netherlands are collectively more important than the rivers. The chief is the great ship canal, 26 feet deep and 197 wide, from Wijk, on the North Sea, to Amsterdam, and connected by locks with the Zuider Zee, opened in November 1877. This great canal shortens the distance between Amsterdam and the sea to about 15 miles. The North Holland Canal allows large ships to pass between Amsterdam and the Helder, a distance of 40 miles, so as to avoid the intricate navigation of the Zuider Zee; the Winschoten Canal, also for ships, 18 miles long, connects the Dollart with Groningen; the Damster-Diep, of equal magnitude, runs from Groningen to the sea at Delfzijl; another canal connects Harlingen, on the Zuider Zee, with Groningen; the Nieuwer Sluis unites Utrecht with Amsterdam, while the latter city also communicates with Rotterdam. The Dutch canals are much used by passengers and the slowness of the trekschuyts or boats is compensated in some measure by their punctuality. In winter their frozen surface offers convenient roads to skaters and they are then traveled over with greater speed.

Climate.—The climate is extremely humid, changeable and disagreeable; violent winds, with varying temperature, frequently blow from southwest or northwest and heavy sea-fogs are driven in which injure vegetation. The mean average annual temperature is 50° F.; 35° in January and 65° in July; the average annual rainfall is 26 inches. The winter is severe and the sky is almost always overcast and troubled. The bright days hardly exceed 40 in the year. Low fevers visit the marshy districts in autumn, but the dry cold of winter restores the peasant's health. Although the climate is to strangers cheerless and depressing, its prejudicial effects on health are counterbalanced by good food and clothing and habitual cleanliness; the Dutch give particular attention to these domestic safeguards, and, not-

withstanding the ungenial climate in which they live, longevity is not rarer among them than elsewhere.

Agriculture, etc.—Horticulture and agriculture have been developed to a high degree of perfection, although the latter holds a subordinate place in rural industry. The soil consists chiefly of alluvial deposits. Wheat, of excellent quality, is grown only in favored portions of the south provinces. Rye, oats and buckwheat, with horse-beans, beet, madder and chicory, are more common crops; and tobacco is cultivated in the provinces of Gelderland, South Holland and Utrecht; flax in Zeeland and the environs of Dortrecht, and hemp, oil-seeds and hops in various parts of the kingdom. Culinary vegetables are cultivated on a much larger scale for home use and also for the exportation of the seeds, which form an important article of Dutch commerce. Dutch agriculture atones in thoroughness for what it lacks in extent. The farmers are highly skilled and to them many of the chief improvements in modern agriculture are due. The culture of flowers and especially of flowering bulbs has long been one of the most important industries of the country and is of ever-increasing importance. The chief centre of this industry is Haarlem and every year large quantities of bulbs of all kinds are exported to foreign countries. It is in stock, and dairy produce in particular, that the rural industry of the Netherlands shows its greatest strength. Their horses are remarkable for size and strength and much sought after; and in the number and excellence of their horned cattle the Dutch stand equally high. The poultry-yard is also to the Dutch farmer a source of wealth. Bee-culture is likewise actively carried on, especially in Gelderland and Drenthe. The quantity of cheese and butter brought to market is enormous. About 2,100,000 acres are under culture, nearly 3,000,000 are pasture land, over 150,000 are devoted to gardens and orchards, some 620,000 are forest, about 1,500,000 are uncultivated heath, fully 300,000 are water and morass and about 125,000 acres are occupied by dikes and roads.

Manufactures and Commerce.—Manufactures have never held a very important place, though the linen of the Dutch Netherlands has long held the first rank. The manufacture of woolen cloth centres in Leyden, Utrecht and Tillburg. The distilleries of Schiedam are well known; Gouda supplies tobacco-pipes, the best of their kind; and the same praise may be bestowed on the leather, the refined sugar of the Dutch, the pottery, bricks, tiles, glassware and many other articles intended for Continental use. Ship-building and the manufactures subsidiary to that industry are largely carried on in many places. Coal is mined in the province of Limburg, the mines chiefly belonging to the state; 2,262,148 tons were extracted in 1915, valued at \$7,510,000. The commerce with the Dutch possessions in the East Indies, particularly Java, is of great and continually increasing importance. The total exports of home produce and imports for home consumption, inclusive of bullion and specie, in a normal year were, imports \$1,632,500,000; exports \$1,285,000,000. The trade is chiefly with Great Britain and Germany.

Shipping, Navigation and Fisheries.—The mercantile navy of the Netherlands numbers 786 vessels of 40 tons and upwards; 406 steamers of 716,192 and 380 sailing vessels of 44,473; making a total tonnage of 760,665. The vessels entered in 1917 were 2,184 of 5,260,832 tons; cleared, 2,186 of 5,078,379 tons. The herring, oyster and other fisheries of the North Sea employed 6,151 vessels of all kinds, manned by over 23,800 seamen. The oyster fishery yields over 1,900 tons annually, while the value of the herring fishery is estimated at \$1,273,085.

Railways, the Post Office, Telegraphs, etc.—The total length of railways in the Netherlands is over 2,382 miles, which belong to private companies. The railways yield an annual revenue of \$40,101,250; the expenditure is \$30,772,920. The post office is well organized and also yields a revenue in excess of the expenditure. The length of state telegraph lines in operation is about 5,172 miles. The canals have a length of 2,000 miles (see paragraph on *Hydrography*).

Money, Weights and Measures.—The guilder or florin, value 40 cents, is the chief denomination of money. Ten-guilder gold pieces are coined, but silver is chiefly in circulation. The French metric system of weights and measures has been adopted, the principal names being— the kilogram or *pond*, metre or *el*, gilometer or *mijl*, are or *verkanste roede*, hektare or *bunder*, stere or *wisse*, litre or *kan*, and hektolitre or *vat*.

Government, Finances, etc.—The kingdom of the Netherlands, as now constituted, is a constitutional monarchy. The executive power lies wholly with the sovereign, who shares also in the work of legislation with the States-General. These consist of two chambers—the upper with 50 and the lower with 100 members—who assemble for deliberation and dispatch of business at The Hague ('Sgravenhage'). The members of the upper chamber are elected by the provincial states from among the most highly assessed inhabitants of the various counties; the others are elected by ballot, at the rate of one deputy to every 45,000 souls. The government is strong and the administration in every department is simple and economical. The revenue of the Netherlands during the last few years has averaged about \$56,000,000 per annum and the expenditure about \$58,000,000. The debt of the state amounts to about \$485,000,000, the interest on which forms the largest branch of the expenditure. The chief items of revenue are yielded by the excise and direct and indirect taxation. The army comprises some 150,000 men on a war footing, but only about 30,000 altogether in peace, and 1,500 officers. It is formed partly by conscription and partly by enlistment. Substitution was abolished in 1898. The army of the East Indies is about 42,000 strong. The navy comprises 7 first-class iron-clads and 5 cruisers, besides a number of gun-boats, 36 torpedo-boats, training-ships, 9 submarines, a submarine depot ship, 2 mine layers, etc.

Colonies.—In addition to her European territories the Netherlands possesses a wide extent of colonies and dependencies in Asia and America, with which she carries on extensive commerce and which contribute materially to her greatness. Her chief Asiatic colonies are the Dutch East Indies (q.v.) comprising Java,

Sumatra, part of Borneo; Celebes and part of New Guinea, with Banca, Bali, Lombok, Sumbawa, Flores and other islands in the Malay Archipelago; while in America she possesses Surinam or Dutch Guiana, and the West Indian islands of Curaçao, Saba, Saint Eustatius, etc. Estimated area, 782,863 square miles; pop. about 34,000,000.

Ethnology.—The stock to which the people belong is the Teutonic, the great majority of the inhabitants being descendants of the old Batavians. They comprise over 70 per cent of the population and are chiefly settled in the provinces of North and South Holland, Zeeland, Utrecht and Gelderland. The Flemings of North Brabant and Limburg and the Frisians, inhabiting Friesland, Groningen, Drenthe and Overijssel, form the other groups.

Population.—As given in the paragraph *Political Division* the total population in 1916 was 6,583,227, of whom 3,270,859 were males and 3,312,167 females.

Education.—In respect of education the Netherlands occupy a high place among the nations of Europe. In 1857 a non-denominational primary instruction law was passed and in 1878 this law was supplemented by another containing more stringent regulations with the view of making primary education more general. In 1900 instruction was made obligatory. An act passed in 1889 diminished public instruction and encouraged private instruction, which is now supported by the state. The cost of public primary education is borne jointly by the state and the communes, the former contributing to teachers' salaries and being responsible for one-quarter of the cost of founding or purchasing schools. Above the primary schools are the middle class, secondary and classical schools, a polytechnic institution at Delft, special colleges for agriculture, horticulture, etc. There are four public universities, namely, at Leyden, Utrecht, Groningen and Amsterdam, and also a private university.

Religion.—A majority of the inhabitants belong to the Reformed Church and Roman Catholics also are numerous. The members of all religious denominations possess, by the Constitution, perfect liberty of conscience and social equality. The number of Protestants is over 3,068,000; of Roman Catholics, about 2,000,000; Jews, 104,000; other religions, 18,000; persons not belonging to any religious body, 115,200. The Reformed Church is Presbyterian in government, while the Roman Catholics are ruled by an archbishop and four bishops.

History.—The south portion of the Low Countries belonged at the beginning of the Christian era to Belgic Gaul. (See GAUL). The north portion, inhabited by the Batavians and Frisians (q.v.), formed part of Germany. The south portion as far as the Rhine was held by Rome up to 400 A.D., after which it came under the rule of the Franks, as did also subsequently the rest of the country. In the 11th century the territory comprised in the present kingdoms of Belgium and the Netherlands formed a number of countries, marquisates and duchies corresponding more or less with the modern provinces. By the latter part of the 15th century all these had been acquired by the Duke of Burgundy and passed to the house of Hapsburg on the marriage of the daughter of Charles the Bold of Burgundy

HOLLAND

to the son of the Emperor Frederick III. On the abdication of Charles V in 1556 they passed to his son Philip II of Spain (q.v.). In consequence of religious persecution in 1576 Holland and Zeeland openly rebelled and in 1579 the five north provinces—Holland, Zeeland, Utrecht, Guelders and Friesland—concluded the celebrated Union of Utrecht, by which they declared themselves independent of Spain. They were joined in 1580 by Overijssel and in 1594 by Groningen. After the assassination of William of Orange, 10 July 1584, Maurice became stadtholder (governor). His victories at Nieupoort and in Brabant, the bold and victorious exploits of the Dutch admirals against the navy of Philip II, the wars of France and England against Spain and the apathy of Philip II, caused in 1609 the Peace of Antwerp. But Holland had yet to go through the Thirty Years' War before its independence, now recognized by all the powers except Spain, was fully secured by the Peace of Westphalia. In the middle of the 17th century the United Netherlands was the first commercial state and the first maritime power in the world, and for a long time maintained the dominion of the sea. The south provinces alternated between the rule of Spain and Austria till 1797, when they came under the power of the French Republic. In 1806 Louis Napoleon became king of Holland, but in 1810 it was incorporated with the French Empire. In 1814 all the provinces both of Holland and Belgium were united by the Treaty of Paris to form the kingdom of the Netherlands. This arrangement lasted till 1830, when the south provinces broke away and formed the kingdom of Belgium. King Willem I attempted to reduce the revolted provinces by force but the great powers intervened, and finally matters were adjusted between the two countries in 1839. The king abdicated in 1840, and was succeeded by his son Willem II (1840-49), he being again succeeded by his son Willem III, whose reign on the whole was uneventful. Slavery was abolished in the Dutch West Indian possessions in 1863, slave-owners receiving compensation. In 1873 the Dutch began a war with the Acheenese of Sumatra, and hostilities have lingered on ever since. In 1887 the Heemskerk Liberal ministry passed a bill amending the Constitution.

On 23 Nov. 1890, the king died, and was succeeded by his young daughter, Wilhelmina Helena Pauline Maria, under the regency of her mother, the Queen-dowager Emma. The year 1892 was marked by serious disturbances among the unemployed, and in 1893 the Socialists carried on a vigorous propaganda. In 1896 the franchise was extended by a new bill, which received the regent's assent. Besides the unsuccessful war against the people of Acheen, in Sumatra, the Dutch in 1894 had to face also a revolt in the island of Lombok. A Dutch force met with a serious disaster here, but soon afterward General Vetter re-established the authority of the Netherlands. In 1898 Queen Wilhelmina attained her legal majority, and formally took up the reins of government. The most notable event of 1899 was the meeting of the great Peace Conference at The Hague. (See HAGUE COURT). In 1900 primary education was made compulsory by law. In February 1901, the queen married Prince Henry of

Mecklenburg-Schwerin. In 1908 there were difficulties over Curaçoa with Venezuelans, who seized four coast defense vessels. The affair was arbitrated in 1909 by the return of the vessel, and by Venezuela paying an indemnity of \$4,000. In 1913 the Coast Defense Bill appropriating \$5,000,000 for fortifying Flushing created European discussion, it being rumored that the project was instigated by Germany as a move against an English landing in the event of war. After the outbreak of the European War in 1914 the position of Holland was one requiring continuous vigilance against violations of its neutrality. It was distinguished by magnanimous assistance and charity extended to its oppressed Belgian neighbors, and by belligerent demands that strained perilously near rupture points. (For these events see WAR, EUROPEAN—NEUTRAL STATES IN THE). Consult Amicis, 'Holland' (1893); Barker, 'Rise and Decline of the Netherlands' (1906); Bernard, 'La Hollande Géographique, Ethnologique, etc.' (1900); Boulger, 'Holland and the Dutch' (1913); Hayard, 'In the Heart of Holland' (1880); Meldrum, 'Holland and the Hollanders' (1880); Motley, 'The Rise of the Dutch Republic' (1858), and 'History of the United Netherlands' (1869); Torchiana, H. V., 'Holland, the Birthplace of American Political, Civic and Religious Liberty' (1915); Van Loon, 'Fall of the Dutch Republic' (1913); id., 'Rise of the Dutch Kingdom 1759-1813' (1915); Wharton, 'Holland of To-Day' (1912).

NETHERLANDS, Language, Literature and Science of the. The literary language of the kingdom of the Netherlands is in English called Dutch, but by the people themselves is called *Hollandsch* or *Nederduitsch*, that is, Low Dutch. This name it receives in opposition to the *Hochdeutsch* or High Dutch, the literary language of modern Germany. Closely allied to the Dutch, so closely indeed as to be distinguished from it only by some orthographic and other minor differences, is the Flemish (*Vlaemsch*) language, spoken partly in the kingdom of Holland, but mainly in the Belgian provinces of East and West Flanders, Limburg, Antwerp and South Brabant. (See FLEMISH LANGUAGE AND LITERATURE). Both languages belong to the Low German group of the Teutonic or Germanic branch of the Indo-European family of languages. The two languages, or rather dialects, are in fact in their early history identical and the term Flemish is applied, on the one hand, to the original form of both dialects and to the literature produced in it before it separated into these dialects; and on the other hand to that one of the two dialects which is still spoken in the parts above mentioned, and to the literature produced in it. It is only in this latter application of the term that the Flemish language and literature can be noticed separately. The non-literary Low-German dialects spoken in the Netherlands may be divided into the Frisian, an idiom which is gradually disappearing (it has a small literature—see FRISIANS); the Guelders dialect, or the so-called Lower Rhenish; the Groningen dialect, to which also belongs the Over-Yssel dialect, bearing a considerable resemblance to the German.

The common parent of the modern Dutch and Flemish was at one time supposed to be a development of the Old Frisian, but the general

view at the present day appears to be that the characteristic forms of the language of the Netherlands are at least as old as those of the Old Frisian, and that both languages are separate developments of a still older original. The Dutch language resembles the German in its vocabulary and syntax, but is considerably simpler in its accidence. Its vowel sounds are broader than those of the Germans, and its gutturals harsher. It possesses the same power of forming compound words from native materials as the German, and even to a greater extent, for while the German frequently borrows adjectives (for example) from foreign sources to correspond to nouns of native formation, the Dutch has for the most part such adjectives paronymous with the nouns. Thus the Germans may use the word *Wissenschaftslehre* for philosophy, but are obliged to adopt *philosophisch* for philosophical; while the Dutch have *Wijsbegeerte* and *wijsgeerig*, both of native origin.

The oldest literary monument of the language of the Netherlands is, as far as can be ascertained, an ordinance of the town of Brussels dated 1229, although it is possible that a few of the poems which have come down to us, particularly 'Reinaert de Vos' (Renard the Fox) may belong to the second half of the 12th century. In the latter part of the 13th century the language was brought to a pretty high point of literary cultivation by Jacob van Maerlant (born 1235), author of the 'Spiegel Historiæ,' but not long after his date the language began to decay, owing to the introduction of French forms, words and idioms through the Burgundian domination (1363-1477). A few literary societies, called *Rederijkerskamern*, appear to have striven against this result, but their efforts were not rewarded with any success until the struggle with Spain at the close of the 16th century produced a reaction among the population of the Netherlands in favor of their native language, a reaction which, however, proved permanent only in the northern Protestant provinces, which eventually succeeded in throwing off the Spanish yoke, and which now form the kingdom of the Netherlands. The chief specimens of the language belonging to the period intervening between Maerlant and the reaction at the close of the 16th century are the civic laws of Antwerp (1300), a few chronicles such as that of J. Van Clere and a translation of Boethius by Jacob Velt of Bruges (15th century).

The leaders in the restoration of the language of the Netherlands, or as we may now call it Dutch, to the dignity of a literary medium were Dirk Volkertszoon Coornhert and Philips van Marnix, both distinguished also as statesmen who took a leading part in all the political and theological conflicts of the day. Coornhert (1522-90) was a poet and dramatist as well as a prose-writer; but while in his poems and dramas he rises little above the *Rederijker* of his time — of a society of whom at Amsterdam he was a member — his numerous prose works are still looked upon as works of merit. Marnix (1538-98), although inferior to the former in purity of language, obtained even greater renown by his 'Bijenkorf der heil Roomsche Kerche' (1569, often since reprinted and translated into foreign languages). One of these two (it is uncertain which) is also the author of the national song 'Wilhelmus van Nassauwen.' The efforts of these men were entirely successful so

that before the final conclusion of peace (1648) the golden age of the Dutch national literature, which fills up the greater part of the 17th century, had begun. Energy, independence, vivacity and elevation of sentiment characterize the more important writers at the beginning of this period, among whom Hooft and Vondel hold the first place. Pieter Corneliszoon Hooft (1581-1647) brought the prose style to a high degree of excellence, and Joost van den Vondel (1587-1679), the greatest of Dutch dramatists, performed the same service for the language of poetry, and made it peculiarly fit for the expression of the sublime. Jacob Cats, familiarly known in Holland as 'Father Cats' (1577-1660), on the other hand, confined himself to the sphere of every-day life. His verses are marked by a careless ease, sometimes even slovenliness; but his language is pure, a circumstance of some importance, since after the termination of the war, when the mind of the people had become toned down from the high pitch to which it had been raised by their struggle for freedom and independence, he became the special favorite of his countrymen, and had thus a large share of influence in determining the character of the national language. Among the other leading names in pure literature belonging to this period are those of Constantyn Huygens (1596-1686), father of the celebrated mathematician, a satirist, epigrammatist and didactic poet; Jacob van Westerbeaen (died 1670) and Jan Van Hemskerck (died 1656), both erotic poets, the latter author of 'Minnedichten,' in imitation of Ovid, and also of a poetic romance entitled 'Bataavsche Arcadia'; Dirk Kamphuisen (died 1626), a celebrated hymn-writer. No department of literature received more attention than the drama during this period, and several authors who afterward distinguished themselves in other fields began their literary career as dramatists. Among these were Brandt (died 1685), who was also an historian and epigrammatist; Ondaan (died 1692), a political writer and lyricist; and Antonides van der Goes (died 1684), celebrated as a lyricist chiefly on account of his poem 'De Ijstroom' in which he sings the praises of Amsterdam. The principal writer of comedies was Bredero (1585-1618), whose language is that of the lowest of the people.

With the sinking of the national spirit which followed the conclusion of peace the national literature also began to decline, and its decline was hastened by its falling under French influence, to a great extent in consequence of the large influx of French Huguenots after the revocation of the Edict of Nantes (1685). In the crowd of feeble imitators of French originals which the 18th century produced in Holland, there are but few that can be singled out either as having kept themselves more or less free from that baneful influence, or as having shown unusual ability in what they performed under it. Among the former are the nature-poet Hubert Corneliszoon Poot (died 1733), the lyricist Jan van Broekhuysen (died 1707), and Pieter Langendijk (died 1756), a writer of comedies; among the latter Lucas Rotgans (died 1710), author of a number of dramas and a tedious epic entitled 'Willem III,' Arnold Hoogvliet, Sijbrand Feitama, Nicolas Simonzoon van Winter (died 1795), and the brothers Van Haren.

During all this period, however, the language

had maintained its purity almost uncorrupted, and again swept itself quite free from foreign taint when the literature took a more healthful development in the last quarter of the 18th century. The immediate cause of this change was the occupation of the Dutch with German literature, at that time energetically rising into prominence; and the change was assisted subsequently by their becoming acquainted with English literature, and by the internal commotions and the dangers from without, which quickened the national spirit. The change was first discernible in the lyric poetry. Jacob Belamy (1757-86) and Rijnvis Feith (1753-1824) show most plainly in this branch of poetry the influence of the Germans, while Pieter Nieuwland (1764-94) formed himself more after the ancients. Willem Bilderdijk (1756-1831), admirably gifted by nature, acquired by study and practice a wide knowledge of literature and a rare command of language, and shone in all departments of poetry, but was unable to breathe into his works any originality, owing to his rigorous adherence to the pedantic rules of Boileau, which prevented his rightly appreciating English and German literature. J. F. Helmers (1767-1813), a poet of more warmth than Bilderdijk, won great applause by the descriptive poem 'De Hollandsche Natie,' in which he glorifies his native country. The pleasing Hendrik Tollens (1780-1856) was as a lyricist the avowed favorite of his country, and his 'Overwintering der Hollanders op Nova-Zembla' is regarded as the best descriptive poem in the Dutch language. Among the others whose productions have met with more or less acceptance are Cornelis Loots, Adriaan Loosjes, Ad. Simons, the original and humorous A. C. W. Staring van den Wildenborch, Bilderdijk's disciple and eulogist Isaak Dacosta, by birth a Portuguese Jew, and J. J. L. ten Cate, an able translator of foreign poetry. An important service was rendered to the literature of his country by Jacob van Lennep (1802-68), who, incited by the example of Scott and Byron, introduced romanticism, and successfully repressed French classicism, by his masterly treatment of native tales and historical subjects in narrative poems. His chief followers are A. Bogaers, H. A. Meyer, B. ter Haar and N. Beets. The dramatic productions of this period are comparatively insignificant. Prose, which since Brandt had sunk very low in Holland, was first raised again by Justus van Effen in his *Hollandischen Spectator* (1731-35), an interesting periodical in imitation of the English *Spectator*. The orthography of the Dutch language was very unsettled formerly; but a uniform system vigorously opposed by Bilderdijk and others was adopted in the schools in 1804. About the beginning of the 19th century Van der Palm, De Borch, Siegenbeek and others acquired more or less distinction as historians; but the prose of Holland continued to be characterized by a somewhat strained rhetorical style till it was freed from its fetters by Geel and Van Lennep, the latter of whom wrote novels in language at once refined and popular. The novelists who rank next to Van Lennep are Oltmans (pseudonym Van den Hage), Mrs. Bosboom-Toussaint, Mulder, Hofdyk, Adele Opzoomer (pseudonym A. S. C. Wallis), Dekker, Daum (pseudonym Maurits), Van Rees, etc. Maarten

Maartens writes his novels both in English and Dutch. Besides these novelists by profession the dramatist Schimmel has done good work in the department of the historical novel, and the poet N. Beets has published, under the title of 'Camera Obscura,' a series of sketches and tales illustrative of Dutch life overflowing with wit and humor. The list of recent Dutch prose writers also includes Weitzel, Lange, J. ten Brink, Gorter, Huet, Fruin (the Dutch Motley), Vosmaer, Vissering, Pierson, Keller, the youthful poet Perk (1860-81), Emants, Kloos, Netoscher, Verwey, Pol de Mont, Couperus, Schaepmann, Borel, Van Hulzen, Van Eeden, Helene Swarth-Lapidoth, Van Deyssel, De Koo and Steijn Streuvels.

Dutch Science and Scholarship.—The Dutch on the whole can point to higher names in the various branches of scholarship and science than in that of pure literature, a circumstance which is no doubt partly due to the greater ease with which the results of such labors can become known and appreciated in translations than those of pure literature. Gansfort and Agricola in Groningen were among the first who distinguished themselves as divines and scholars. Erasmus of Rotterdam made far greater progress. A still greater genius, Hugo Grotius, in the beginning of the 17th century devoted himself simultaneously to philology and antiquities, poetry, history, philosophy, theology and jurisprudence in all its branches. The northern provinces were long destitute of a university; that of Louvain, in Brabant, served for all the Low Countries. But the University of Leyden, founded in 1575 by Prince William I, soon exerted a beneficial influence over the whole united Netherlands. Men like Scaliger, Lipsius, Daniel and Nicolas Heinsius, Gronovius, Spanheim, Arminius, Drusius, Coccejus, and others, made this university famous over all Europe. Universities were also founded at Franeker in 1585, at Groningen in 1614, Utrecht in 1636 and Harderwijk in 1647, and their competition with the University of Leyden was very advantageous to science. Toward the end of the 17th century Huygens, Leeuwenhoek, Zwammerdam and Hartsoeker distinguished themselves in natural history and astronomy; Alb. Schultens, Tiberius Hemsterhuis, Lambert ten Kate and Hermann Boerhaave in medicine; and a series of distinguished men flourished, particularly at Leyden. Utrecht had its Wesseling, Duker, Drakenborch and Saxe. Among the jurisconsults Mathaeus, Huber, Noot and Voet are distinguished. The cultivation of the Dutch language was especially promoted by Lambert ten Kate, Sewels, Zeydelaar, Kramer and Van Moerbeek. In philology, history, geography, mathematics, natural philosophy and medicine, the Dutch distinguished themselves in the highest degree, and their contributions to civil and public law are very valuable. They have always had men of the first distinction in ancient classical literature. From these notes it will appear that efforts have been made to adopt the language to elevated purposes, and that they have been crowned with success. The prose of the Dutch has little euphony and elegance, but it is well adapted to express practical truths in a simple and popular manner. It would undoubtedly have acquired greater perfection if their philosophical and other writers had not often

made use of a foreign language. Erasmus, Lipsius, Grotius, Wyttenbach and others wrote in Latin, and Francis Hemsterhuys in French. As with philosophy, so also with history. The sciences have flourished in the northern provinces, and kept pace with the progress of the times; but this is not the case in the southern provinces. The study of the law and of general jurisprudence is in a flourishing condition, and medicine has its notable exponents. The Dutch excel in mechanics and hydraulics. Consult Schneider, 'Geschichte der Niederländischen Litteratur' (1887); Jonckbloet, 'Geschiedenis der Nederlandsche Letterkunde' (1873); Ten Brink, 'Geschiedenis der Noord-Nederlandsche Letteren in de XIXe Eeuw' (1904); Kalf, 'Geschiedenis der Nederlandsche Letterkunde' (Groningen 1906).

NETHERLANDS, Religious Conditions in. The religious situation of the Netherlands is quite complex. Of the 6,583,227 inhabitants which the census of 1918 reported, over 2,000,000 belong to the Roman Catholic Church. They are found principally in the provinces of North Brabant and Limburg. The Netherland Reformed Church (Hervormd), up to 1795 the State Church, and still receiving financial aid from the government, enrolls about 1,500,000 of the population. While a strong party in this body is strictly Calvinistic, especially the membership in the large cities, an influential element is decidedly liberal and practically unitarian. Both Psalms and hymns are used in public worship. The government of the Church, originally on presbyterian principles, has become considerably collegialistic. The General Synod is the highest Church court meeting annually; subject to it are provincial synods, composed of delegates from "classes" or presbyteries. The local church is ruled by a consistory. The standards of the Church are the Netherland Confession of Faith, the Heidelberg Catechism and the Canons of Dordrecht, but preachers are not bound to adhere to the letter of this Creed.

Connected with the Reformed Church as a particular synod is the *Walloon Church*, originally composed of French Reformed refugees, and at present numbering some 10,000 members. The French language is used in public worship. Liberalism prevails in this body. There are 16 churches and 24 pastors.

In 1834 a number of the stricter Calvinistic people separated from the Netherland Reformed Church, forming the *Christian Reformed Church*, which in 1890 united with the *Low Dutch Reformed Churches* (Doleerend), which in 1886 had withdrawn from the Netherland Reformed Church. They are known as the *Reformed Churches in the Netherlands*. Their official standards are those of the old body, but faithfully adhered to. The Psalms, and a few hymns, are used in public worship. In 1916 the communicant membership was 180,632. There are about 700 congregations, 54 "classes" or presbyteries and 12 particular synods. The General Synod meets every three years. The Theological School at Kampen and the Free University in Amsterdam educate their ministry. The Netherland Reformed Church has arrangements made for this purpose with the universi-

ties of Leyden, Utrecht and Groningen. The *Christian Reformed Church in the Netherlands*, with about 45,000 communicants, is composed of those who refused to enter upon the union of 1890 above referred to. Its theological school is in Apeldoorn. This body is very conservative, which is also the case with the "*Reformed congregations*," numbering some 40 local organizations, many of them in the province of Zeeland. Some "Free Reformed" churches have their chief distinction in using an old version of the metrical Psalms. In church government they are independents.

The *Remonstrant Brotherhood*, originally composed of followers of *Arminius*, condemned at the Synod of Dordrecht, 1618-19, is a pronouncedly liberal body, enrolling 28 churches, served by 29 pastors. Its seminary is in Leyden. The *Evangelical Lutheran Church* is a scion of the Lutheran Churches of Germany, the same as the *Restored Evangelical Lutheran Church*, which in 1791 separated from the older body because of its liberalism. The Evangelical Lutheran Church numbers 48 congregations, served by 60 ministers. Its seminary is in Amsterdam. The Restored Evangelical Lutheran Church (8 congregations and 11 pastors), has a training school for its ministry in Utrecht.

The *Mennonite Church*, or Baptist Society, dates from Reformation days and is of Anabaptist origin. Its 122 congregations are liberal in doctrine. Their seminary is in Amsterdam.

Anglican and *Presbyterian* churches are found in the chief seaports of the Netherlands. In various places are groups belonging to churches of American or English origin, such as Adventists, Baptists, Seventh Day Baptists, Apostolic Believers, Darbists, Irvingites, Moravians, etc.

The *Old-Catholic Church* maintains a separate existence since the time of the Reformation, although it is a dwindling body. In 1784 it numbered 50 churches with 79 priests; at present there are 26 congregations with 27 priests.

HENRY BEETS.

NETHERLANDS SCHOOLS OF PAINTING. The, are comprised in the Dutch and the Flemish schools. The Flemish school was founded by the brothers Hubert and Jan van Eyck, who established themselves at Bruges, and attracted scholars from far and near. They flourished between 1370 and 1445. The Flemish school is distinguished by brilliant coloring; magical effect of the chiaroscuro; carefully labored though often tasteless drawing; a strong yet natural expression, and boldness in composition. Among the scholars of the Van Eycks was Hans Memling, an artist whose works are among the best of the early Flemish school. Among later masters of the same school are Quintin Matsys or Messys of Antwerp (died 1529), Luke of Leyden (died 1533), and wholly in the 16th century Francis Floris (born 1520; died 1570), called, on account of the great influence he exercised on contemporary painting, the Flemish Raphael. Among his scholars were the two Francks, the two Pourbuses, and Mart. de Vos (born 1520). Other painters rather later in time are Spranger (born 1546); Henry Steenwyk, the painter of perspective (born 1550); Denis Calvert; the brothers Paul and Matthew Bri; Van Ort (born 1557); and the

two Pieter Breughels, father and son; Roland Savery of Courtray (born in 1576). After all these came Peter Paul Rubens (1577-1646), the boldest painter of modern times; a man of inexhaustible industry, of gigantic imagination and power of representation, to whom about 4,000 paintings are ascribed. With him the Flemish school reached its acme. Several distinguished painters follow: Frans Snyders (born 1579), whose hunting and animal pieces excel all others in boldness and truth; Josse de Momper (born 1580), a landscape-painter esteemed for his valleys and the distant views which they present; Pieter Neefs, the famous church painter; David Teniers, father and son, noted for their representations of peasants, guard-rooms, tap-houses and all kinds of low life; Gaspar de Crayer (born 1582), who approaches in the expression and coloring of his historical paintings to Rubens; Gerard Seghers, distinguished as a historical painter; his brother Daniel, famous for flower and insect pieces. Jakob Jordaens (born 1594), however, excelled all those who make Rubens their model. Abraham Janssen and his pupil Theodoor Rombouts equal Rubens in coloring, but not in conception. The industrious Luke van Uden executed the landscapes for Rubens' paintings, and his views of the sky at dawn are worthy the study of every artist. Anthony Vandyck (born 1599) obtained the name of the "king of portrait painters." He excelled Rubens in correctness and beauty of forms. Cornelius Schut, for whom Jan Wildens often painted the landscapes, distinguished himself as a historical painter; Adriaan Brouwer acquired fame by his excellent representations of scenes from common life; Jan van der Meer by his pastoral pieces; Anton Francis van der Meulen by his battle pieces; Frans and Jan Milet, father and son, by their landscapes. Besides these there are the names of Jan Bol, Wenceslaus Koeberger, Hendrik Goltzius, Hendrik van Balen, Frans Hals, Willem van den Nieuwelandt, Abraham Diepenbeck, Theod. van Thulden, Gerard Lairesse, Jan Frans van Bloemann, Jan van Cleef, Pieter Eykens, Robert van Oudenarde, Jan Anton van der Leepe, Jan van Breda, etc.

The Dutch school is distinguished for a faithful copying of nature, great finish, good chiaroscuro, skilful disposition of color and delicate penciling; but it is reproached with choosing often ignoble subjects and with incorrectness of drawing. Its founder is Luke of Leyden (born 1494). Its most prominent artists are Otho van Veen, of Leyden (born 1586; died 1634), who deserves mention also as the teacher of Rubens. Abraham Bloemart of Gorkum (died 1647) painted historical subjects, landscapes and animals in good taste. Cornelis Poellenburg of Utrecht (born 1586; died 1663) was peculiarly happy in painting small landscapes with figures. Worthy pupils of his are Daniel Vertange and Jan van Haensberge. Johan Wynants of Haarlem (born 1600) is distinguished as a landscape-painter; and Jan Daniel de Heem, of Utrecht (born 1604; died 1674) for his faithful imitation of flowers, fruits, carpets, vases, etc. The highest place belongs to Rembrandt (1606-69), whose masterly coloring atones for all his defects: In the delineation of common life the following are distinguished: Gerard Terburg of Zwooll (born 1608; died 1681); Pieter van

Laar (1613-73), the two Ostades, and Jan Steen (1636-89); in landscapes, Jan Both of Utrecht (born 1610; died 1650); Hermann Swaneveld of Woerden (born 1620; died 1690). Asselyn (born 1610; died 1680) painted battles, landscapes and pastoral pieces with brilliant coloring and a delicate pencil. Scarcely any painter drew more correctly, colored more beautifully and distributed light more truly than Gerhad Dow or Douw (born 1613; died 1680). John Fyt (born at Antwerp, 1625) was a good painter of beasts, birds and fruits; Gabriel Metz, who worked in the style of Terburg, excelled him in softness of penciling. The landscapes of Benenberg of Utrecht are full of life and freshness. Philip Wouvermans (born 1620; died 1668), the most famous painter of horses, produced battle and hunting pieces, horse-markets, travelers and robbers; and his paintings of all kinds are highly esteemed. The landscapes of Anton Waterloo, for which Weenix executed the figures, are sometimes cold, but please on account of the accuracy with which he represents light playing through foliage and the reflection of objects in water. Berghem acquired the name of the Theocritus of painters; and perhaps Paul Potter is the only one who can dispute the superiority in representing cattle with him. While Ludolf Backhuysen painted storms at sea with an effort as true as it is terrible, Frans Mieris distinguished himself by fine and accurate representations of many domestic subjects and Jan Pieter Slingseland was hardly less accurate. Godfrey Schalcken of Dort excelled in the illumination of night scenes. Excellent market scenes, animals and landscapes were painted by Karel du Jardin. Albert Cuyp and Adriaan van de Velde painted landscapes and animals with almost unequalled perfection. Hobbema is another excellent landscape-painter. For the representations of the beautiful solitudes of nature Jakob Ruysdael is celebrated and for quiet lovely moonlight scenes Van der Neer. No painter has painted more delicately and with more finish, even in insignificant trifles, than Adriaan van der Werf. The flower-painters, Pieter van Hulst of Dort and Jakob van Huysum, are almost unrivaled in this department. Other names are Cornelis Ketel, Bartholomew van der Helst, Albert van Everdingen, Gebrandt van den Hendrik Verschuuring, Maria van Oosterwyk, Willem Kalf, Melchior Hondekoeter, Cornelis de Bruyn, the two Houbraken, Rachel Ruisch, Cornelis du Sart, Jan de Witt, Cornelis Troost, Van Os, Van Spaendonck, Scheffer, Ommeganck, etc. About the beginning of the 19th century the classicism of France had a great influence on the Dutch historical school, as seen in the works of Kruseman, Pieneman, Navez and Van Bree. In genre painting the old models were still followed and good work was done by Jan Kobell and Eugene Verboeckhoven; Scheefhout and Schotel deserve mention as landscape and marine painters. A more natural and correct style followed the fall of the school of David in France, and Louis Gallait, Edouard de Biefve, Gustave Wappers, Nicaise de Keyzer and Hendrik Leys distinguished themselves as historical painters. Florient Willems and Alfred Stevens were genre painters. A. de Kuyff and Xavier de Cock painted excellent landscapes. Among modern Dutch painters were Alma Tadema and Josef

Israel. The former long resident in England, a baronet and member of the Royal Academy, was remarkable for the skill with which he treated subjects selected from states of civilization that have passed away, as from ancient Egypt, Greece and Rome. The genre pictures of Israels, of Bisschop, of Mauve; the marine views of Mesdag, and the fine landscapes of the brothers Maris, are also well known. The artists of the Netherlands are still distinguished by the peculiarities of the two schools, the Dutch and the Flemish. The reproach of an almost exclusive adherence to common reality has been often made to the whole school of the Netherlands, but is confined by some to the Dutch; while the Flemish school, in its more elevated productions, has striven to represent a nobler nature. Both are criticized as somewhat deficient in ideal beauty, but distinguished in the highest degree for faithful imitation of nature. Consult Caffin, C. H., 'Story of Dutch Painting' (New York 1911); Crowe and Cavalcaselle, 'Early Flemish Painters' (London 1872); Hofstede de Groot, 'Catalogue Raisonné of the Works of the Most Eminent Dutch Painters of the 17th Century' (New York 1908); Kugler, F. T., 'Handbook of Painting—German, Flemish and Dutch Schools' (London 1909); Marius, G. H., 'Dutch Painters of the 19th Century' (Philadelphia 1908); Rooses, M., 'The Dutch Painters of the 19th Century' (1898-1905); 'Art in Flanders' (New York 1914); Van Dyke, J. C., 'Old Dutch and Flemish Masters' (New York 1896).

CHARLES LEONARD-STUART,
Editorial Staff of *The Americana*.

NETHINIM, in Biblical history, the lowest order of ministers of the temple at Jerusalem. They were hereditary attendants on the Levites in the services of the temple and were to do the more menial part of the work. They enjoyed the privileges of the priestly caste and lived apart on the temple hill. Doubtless they were originally prisoners of war who were dedicated by their captors to menial religious service. It is supposed that the Gibeonites originally held a similar office (Josh. ix, 21-27). At the return from Babylon, 392 of these ministers accompanied Zerubbabel (Ezra ii, 58; Neh. vii, 60), and 220 came with Ezra (Ezra viii, 17, 20); 612 of them in all. Consult Jacobs, J., 'Studies in Biblical Archaeology' (London 1894); McNeile, H. H., in Hastings and Selbie, 'Dictionary of the Bible' (New York 1909).

NÉTHOU, nā-too', Pic de, Spain, the highest point (11,169 feet) of the Pyrenees (q.v.).

NETSCHER, nēts'hēr, Caspar, Dutch painter: b. Heidelberg, 1639; d. The Hague, 15 Jan. 1684. He was taken to Holland in early childhood and as the adopted son of a physician early began the study of medicine, but eventually learned painting from Koster, a still-life painter of Utrecht, and from Terburg (q.v.) at Deventer; he also spent a short time during his student years at Bordeaux, France, but eventually settled permanently at The Hague. He was a genre painter who imitated the manner of Terburg and chose his subjects from aristocratic life. He sometimes, however, painted kitchen interiors and sheep, also portraits. His weakest work consists of small, delicately handled and enamel-like pic-

tures of historical and mythological subjects, which are blemished by mannerisms. Almost every public gallery in Europe contains examples of his numerous works, but the Dresden Gallery is particularly rich in his cabinet pieces, such as his 'Lady at the Harpsichord'; 'The Doctor's Visit'; 'The Harp Player.' The Rijks Museum, Amsterdam, possesses 16 portraits.

NETTEMENT, nēt-män, Alfred François, French journalist: b. Paris, France, 22 July 1805; d. there, 15 Nov. 1869. He was educated at the Collège Rollin in Paris and entered journalism. He founded *L'Opinion Publique* and for his staunch support of the grandson of Charles X he was imprisoned by Louis Philippe after his accession. He wrote 'Histoire de la Révolution de juillet' (1833); 'Histoire de la littérature française sous la Restauration' (1852); 'Histoire de la littérature française sous la royauté de juillet' (1854); 'Vie de madame de marquise de la Rochejacquin' (1858); 'Histoire de la Restauration' (8 vols., 1860-72).

NETTER, Thomas, also called **WALDENSIS**, English Roman Catholic clergyman: b. Saffron Walden, England, about 1377; d. Rouen, France, 2 Nov. 1430. He entered the Carmelite order and was graduated from Oxford, receiving ordination in 1394. He became provincial prior of the Carmelites in 1414 and strongly opposed the Lollard reform movement. He was confessor to Henry V and Henry VI and died while on a mission to Poland for the latter. He wrote 'Doctrinale Fidei Ecclesiæ Catholicæ contra Wiclevistas et Hussitas' and the 'Fasciculi Zizaniorum Magistri Johannis Wyclif' (ed. by Shirley, London 1858).

NETTLE, a plant of the family *Urticaceæ*, having unisexual flowers, the male and female on the same or separate plants: the male flowers with a 4-parted perianth and four stamens; the female flowers with a 2-parted perianth and a tufted stigma; the fruit an achene. The species are herbaceous plants, shrubs or even trees, covered with stinging hairs, which pierce the skin when touched and emit an acrid juice, often causing much inflammation and pain. These hairs are stiff and terminate in a silicious point which penetrates an animal's skin, breaks off and sets free a poison, the nature of which is not understood. When a nettle is grasped in such a way as to press the hairs to the stem no stinging ensues; but the slightest inadvertent touch of some of the species produces very severe pain. The stinging of the native nettles of Europe is trifling in comparison with that of some East Indian species. *Urtica crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about 24 hours and then abates, but is ready to return to its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is *U. urentissima*, the devil's leaf of Timor. The two most familiar species throughout America and Europe in waste places

are the small virulent *U. uréns*, and the less venomous common perennial species, the great nettle (*U. dioica*), often abundant, particularly near human habitations. The roots of nettles boiled with alum afford a yellow dye; and the juice of the stalks and leaves has been used to dye woolen stuffs a beautiful and permanent green. The young shoots of *U. dioica* have been much used in some parts of Scotland and other countries as greens and their peculiar flavor is much relished by some, although, in general, the use of them is confined to the poor. They are valuable as antiscorbutics, but are gritty to the taste from the quantity of crystals (cystoliths) contained. Whatever it is that gives nettles their stinging power is dissipated by boiling and drying. The high value of nettles as food for swine is well known to the peasantry of many countries; the great nettle is cultivated in Sweden for fodder of domestic animals; and nettles are also highly esteemed as food for turkeys. The seeds are extremely nutritious to poultry, and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves are employed in some parts of England for the manufacture of a light kind of beer called nettle beer. The bast-fibre of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fibre of *U. dioica* was used by the ancient Egyptians, and is still used in various countries. When wanted for fibre the plant is cut in the middle of summer and treated like hemp. Nettle-cloth, or grass-cloth, is a beautiful fabric made from rhea fibre. The fibre of *U. cannabina*, a native of the south of central Asia, is much used; and from that of *U. whitlavi* both fine lace and strong ropes can be manufactured. The fibre of *U. japonica* is much used in Japan; that of *U. argentea* in the South Sea Islands and of *U. heterophylla*, a widely-diffused Indian species, is of very glossy silky appearance and is manufactured into cloth in Assam. (See FIBRE). The seeds and herbage of *U. membranacea* are used in Egypt as an emmenagogue and aphrodisiac; and somewhat similar properties are ascribed to *U. dioica*. *U. tuberosa* produces tubers, which are nutritious and are eaten in India raw, boiled or roasted. Australia produces a magnificent tree-nettle, *U. gigas*, abundant in some parts of New South Wales, ordinarily from 25 to 50 feet high, but sometimes 120 or 140 feet, with trunk of great thickness, and very large green leaves, which when young sting violently.

Many plants are so called, as the "dead nettles," labiates of the genus *Lamium*; the "horse nettle" (*Solanum carolinense*); and others.

NETTLE-BUTTERFLY, a European butterfly (*Vanessa urticae*), which feeds and lays its eggs on nettles; other butterflies, including American species, have the same habit.

NETTLE RASH. See URTICARIA.

NETTLE-TREE, a tree of the genus *Celtis*, especially in the United States the hackberry (q.v.); and in Europe *C. australis*, commonly planted as a shade-tree in France and Italy.

NETTLETON, nê't-tôn, Alfred Bayard, American soldier and journalist: b. Berlin, Ohio, 14 Nov. 1838. He was educated at Ober-

lin College and entered the Union army at the outbreak of the Civil War, rising from the ranks to be brevet brigadier-general. He studied law after the war and engaged in a journalistic career and in 1890-93 he was Assistant United States Treasurer. He wrote 'Trusts or Competition' (1900).

NEU BRANDENBURG, noi-brân'dên-boorg, Germany, a town of the Free State of Mecklenburg-Strelitz, 16 miles northeast of Neustrelitz, near Lake Tollense. It was founded in 1248, and retains its picturesque mediæval ramparts and gateways. Its chief edifices are the Belvedere Palace and a 13th century Gothic church. It has manufactures of pianos, machines, paper, etc. It was founded by John I, Margrave of Brandenburg. Pop. 12,348.

NEU-LAUENBURG, noi low'ên-boorg, formerly DUKE OF YORK ISLAND, an island of the Bismarck Archipelago (q.v.) off the west coast of New Mecklenburg. Area, about 27 square miles. Pop. about 3,500.

NEU POMMERN, noi pôm'êrn. See NEW POMERANIA.

NEUCHÂTEL, nè-châ-têl, or **NEUF-CHÂTEL**, Switzerland, the name of a canton, town and lake. (1) The canton in the west of the country, bounded by the cantons of Bern and Vaud, the lake of Neuchâtel and France, has an area of 312 square miles. It lies in the midst of the Jura Mountains, four chains of which, running from northeast to southwest, traverse the canton and are separated by elevated, longitudinal valleys. The greater number of the numerous streams which water the canton flow into the Rhine; several are feeders of the Lake of Neuchâtel mentioned below. Chief of the minerals is the asphalt of Val de Travers. Grazing is extensively attended to; wine, absinthe, fruits, hemp and flax are produced. The manufactures are also important; the principal are lace, cotton, clocks and watches; a considerable industry is also carried on in cutlery, mathematical and philosophical instruments, chintz and other cotton stuffs. The famous Neuchâtel cream-cheeses, however, are made, not in this canton as popularly supposed, but in France, at Neuchâtel-en-Bray, a small Norman town, 25 miles southeast of Dieppe by rail. Neuchâtel was an independent principality as early as 1034. After various changes of masters it came into the hands of the old French family of Longueville (1504), which became extinct in 1707. The king of Prussia, as heir of the house of Orange, was then called to the sovereignty by the states of Neuchâtel, and his title was confirmed by the Treaty of Utrecht. In 1806 Prussia ceded it to France and the emperor conferred it on Marshal Berthier, afterward Prince of Neuchâtel-Wagram. By the Peace of Paris it was restored, with additions, to Prussia. In 1814 the principality was received into the Swiss Confederacy and it was the only canton with a monarchical government, which it preserved till 1848. Its last connections with Prussia were broken in 1857. The religion is Protestant (Reformed). The language is French; but German is also spoken. Pop. (1910) 13,128, mostly French Protestants.

(2) The capital, Neuchâtel, is 24 miles west of Bern, on a steep slope above the northwest shore of Lake Neuchâtel. It has an old Gothic

church of the 12th century; many charitable institutions; a gymnasium or college, containing a valuable natural history collection founded by Professor Agassiz, a native of the town, etc. It has various manufactures and an extensive trade. Pop. (1910) 23,505.

(3) The Lake of Neuchâtel (Neuenburgersee), 1,420 feet above sea-level, is 25 miles long, from three to six miles wide, with a maximum depth of 472 feet. The Thiele serves as its outlet and carries its water into the neighboring Lake of Bienne and thence into the river Aar which communicates with the Rhine. The lake is plentifully supplied with fish; steamers ply on its waters between Neuchâtel, Morat, Yverdon, Estavayer, etc. Traces of prehistoric lake-dwellers have been found here. Consult Bachelin, A., 'Neuchâtel and its Environs' (In 'Europe Illustrated,' Zürich 1883); Diacon and Rousselot, 'Guide du canton de Neuchâtel' (2d ed., Paris 1902); Quartier-la-Fente, E., 'Le canton de Neuchâtel: revue historique et monographique' (Neuchâtel 1895).

NEUENDORFF, noi'en-dörf, **Adolph Heinrich Anton Magnus**, American musician: b. Hamburg, Germany, 13 June 1843; d. New York, 4 Dec. 1897. He came to the United States when 12, was educated in the public schools and pursued a course in music. At 15 he made his début as a pianist and the next year he led a chorus and played in an orchestra. In 1864 he was musical director of the German Theatre, Milwaukee, Wis., and in 1865 he conducted the German grand opera in New York. He founded the Germania Theatre in 1872 and managed it for 11 years; he assumed the leadership of the Philharmonic Society of New York in 1878, and later became director of the Metropolitan Orchestra. From 1884 to 1889 he was a concert director in Boston. His wife, Georgine von Januschowsky (1858-1914), was prima donna of the Imperial Opera, Vienna. He lived there from 1893-95, and returned in 1896 to become musical director of the Jewish Temple Emanu-El in New York. Among his compositions are 'The Rat Charmer of Hamelin' (1880); 'Don Quixote' (1882); 'Prince Waldmeister' (1888), etc.

NEUHOF, noi'höf, **Theodor von**, **BARON**, German adventurer, King Theodore I of Corsica: b. Metz, 1686; d. London, 11 Dec. 1756. His father was a Westphalian noble in the French service; the son became page to the Duchess of Orleans; fought in the French and in the Swedish armies; was employed by Count Goertz and then by Alberoni on diplomatic errands; married Lady Sarsfield, whom he deserted, having stolen her diamonds; lost all his property in Law's schemes; went to Florence in 1732; and there intrigued with some Corsican revolutionists, at whose invitation he landed in Corsica in 1736, with arms and equipment furnished by the Bey of Tunis, and was proclaimed king. He was at first successful against the Genoese, who, however, were reinforced by the French during Neuho's absence in Holland; and he was defeated upon his return in 1738. After the withdrawal of the French in 1741, he made several attempts in 1743 to recover his kingdom and in 1749 retired to England, where he was jailed for debt, and was released in 1756, thanks to a subscription raised by Horace Walpole. His son, Col. Frederick Neuho, an English officer, wrote 'Mémoires

pour Servir à l'Histoire de Corse' (1768). Consult Fitzgerald, 'King Theodore of Corsica' (London 1890).

NEUILLY, nè-yē, or **NEUILLY-SUR-SEINE**, sür sän, France, a town in the department of Seine, suburban to Paris, immediately north of the Bois de Boulogne. The fine 18th century level bridge by Perronet, across the river here, is an attractive feature, and the town is noted for its benevolent institutions, parks and a handsome residential section built chiefly on the site of the historic royal castle and park of Neuilly, destroyed during the Revolution of 1848. Neuilly also has factories of several Paris establishments for the production of domestic commodities. Pop. 44,616.

NEUMANN, noi'män, **Franz Ernst**, German physicist and mineralogist: b. Joachimsthal, 11 Sept. 1798; d. Königsberg, 23 May 1895. He studied at Berlin, and became professor at Königsberg in 1828. His work in physics was of the greatest importance and he is reckoned the father of mathematical physics in Germany, and the founder of the modern theory of mineralogy by reason of his studies of the optical relations of crystals. He published a law of electrodynamics different from that of Ampère and from Grassmann's; determined the diffusivity of soils and of metals; and studied the polarization, reflection and refraction of light, induction currents, specific heat, etc. He established the law that the molecular heat of a compound is the sum of the atomic heats of the elements. This law is known by his name. He contributed to various scientific journals. Many of his lecture courses were edited and published by his pupils; among these are 'Beiträge zur Theorie der Kugelfunktionen' (Leipzig 1878); 'Über ein allgemeines Prinzip der mathematischen Theorie induceter elektrischer Ströme' (Leipzig 1892); 'Commentatio de emendanda formula, per quam colores corporum specifi ex experimentis methodo mixtionis institutis computantur' (Königsberg 1834); 'Die mathematischen Gesetze der induceter elektrischen Ströme' (Leipzig 1889); 'Theoretische Untersuchung der Gesetze, nach welchen das Licht an der Grenze zweier vollkommen durchsichtigen Medien reflectirt und gebrochen wird' (Berlin 1837); 'Vorlesungen über mathematische Physik' (Leipzig 1881-94). Consult the biography by Volkmann (1896), and Neumann, L., 'Erinnerungsbilder von seiner tochter Luise-Neumann' (Tübingen and Leipzig 1904).

NEUMANN, John Nepomucene, Roman Catholic bishop of Philadelphia: b. Prachatitz, Bohemia, 28 March 1811; d. Philadelphia, 5 June 1860. He was educated at Budweis and Prague; took orders; came to America as a missionary in 1836; engaged in work near Niagara for four years; in 1840 entered the Redemptorist Order; and became assistant pastor of Saint James' Church, Baltimore, in 1842. He was again busied in mission work in Pennsylvania, Maryland and Virginia; was appointed superior of the Redemptorist Convent in Pittsburgh, where he built the church of Saint Philomena; returned to Baltimore in 1847 as provincial of the Redemptorists in America; established the Sisters of the Holy Cross in this country; and in 1852 became bishop of Philadelphia. He went to Rome in

1854 and assisted in the definition of the dogma of the Immaculate Conception. Bishop Neumann was a man of culture and of administrative ability, and did much for Catholic education in America. Consult the 'Life' by Berger (trans. into English by Grimm, 1884).

NEUMANN, Karl Friedrich, German Orientalist; b. Reichmansdorf, Bavaria, 22 Dec. 1798; d. Berlin, 17 March 1870. He was educated at Heidelberg, Munich and Göttingen, and after travels in India and China (1829-30) from which he returned with a great number of Hindu and Chinese books, was professor of Oriental languages at Munich 1831-52. He was a Liberal in politics, a circumstance which finally cost him the loss of his professorship. Among his many works are 'Mémoires sur le Vie et les Ouvrages de David Philosophe Arménien' (1829); 'Asiatische Studien' (1837); 'Geschichte der Vereinigten Staaten von Nordamerika' (1863-66); 'Hoen Schein, or the Discovery of America by Buddhist Monks' (1874); 'Geschichte des englischen Reichs in Asien' (1857); 'Geschichte der armenischen Literatur' (1836).

NEUMANN, Karl Gottfried, German mathematician, son of F. E. Neumann (q.v.): b. Königsberg, 7 May 1832; he studied at Königsberg, became instructor of mathematics at Halle in 1858, was made professor at Basel in 1863 and at Tübingen in 1865, and from 1868 to 1911 was professor at Leipzig. In 1868 he founded the *Mathematische Annalen*. His publications and special studies have been in the field of mathematical physics (following his father) and in higher analysis. Among his books are 'Theorie der Besselschen Funktionen' (1867); 'Über die elektrischen Kräfte' (1873, 1898); 'Vorlesungen über die mechanische Theorie der Wärme' (1875); 'Untersuchungen über das logarithmische und Newtonsche Potential' (1879); 'Hydrodynamische Untersuchungen' (1881); 'Vorlesungen über Riemanns Theorie der Abelschen Integrale' (1884); 'Allgemeine Untersuchungen über das Newtonsche Prinzip der Fernwirkungen' (1896).

NEUMAYER, noi-mī-ēr, Georg von, German meteorologist; b. Kirchheimbolanden, Bavaria, 21 June 1826; d. May 1909. He was educated at the University of Munich and went to Australia under the auspices of Maximilian II and there founded the Flagstaff Observatory at Melbourne, where he made valuable magnetic observations. He returned to Germany in 1864 and promoted the German-African Company and organized several expeditions to the North and South Polar regions. He was long connected with the hydrographic bureau at Berlin and in 1876 became director of the Marine Observatory at Hamburg. He wrote among other works 'Die Beobachtungsergebnisse der deutschen Stationen im Systeme der internationalen Polarforschung' (with Börgen, 1886); 'Atlas des Erdmagnetismus' (1891); 'Anemometer-Studien' (1897), and 'Auf zum Südpol!' (1901).

NEUMES, nūmz, in music, (1) signs or characters in early music indicating tones or phrases. A large number of these characters were used, being more or less complicated in form and meaning. This was the first step toward a graphic musical notation. (2) Melodic phrases sung to a single syllable, more

particularly at the end of a sentence or clause. (3) Modulation of the voice in singing. See Music.

NEUMÜNSTER, noi'mün-stēr, Germany, a town in the Prussian province of Schleswig-Holstein, on the Schwale, 17 miles by rail southwest of Kiel. It is a well-built, busy manufacturing centre, producing principally woolens, and also leather, paper, ironware, soap, etc. Pop. 34,555.

NEUQUÉN, nā-oo-kāh', Argentina, a territory in the western part of the republic, bounded on the west by Chile and on the east and south by the territory of Rio Negro. Its area is 42,345 square miles. The main range of the Andes Mountains crosses the western part from north to south, and numerous short ranges extend throughout the territory. The Rio Negro and its largest tributaries have their rise in Neuquén, and the Rio Colorado is on its northern boundary. The principal occupations are agriculture, mining silver and cattle-raising. The population is mostly Indians, but since 1884 a number of Chileans have settled in the territory. Pop. about 29,746. The capital is Neuquen (pop. 1,500).

NEURALGIA (Greek *νεῦρον*, nerve + *ἄλγος*, pain), severe paroxysmal pain, either along the course of one or more sensory nerves, or at the place of their distribution. In neuralgia proper no definite lesions are discoverable. Sometimes there is reason to believe that inflammation of the sheath of the nerve is the starting-point. Not infrequently there are well-defined points of tenderness (ascertained by palpation) over the affected nerve, especially where it emerges upon the skin from a bony groove or opening. Sometimes with the pain there is a twitching of adjacent muscles. Radiation of pain, neuralgic in character, to nerve-branches other than those affected is quite common. Dental caries, for example, may produce supra-orbital neuralgia, and uterine disease, occipital neuralgia. Neuralgic pains are described by the sufferers as cutting, burning, boring, lightning-like, crushing, etc. After a neuralgic attack the part affected has a feeling of discomfort and bruising. There is frequently also a sense of exhaustion, with a desire to sleep. If there are repeated attacks of neuralgia, pallor of the skin, followed by intense redness, by hyperæsthesia, or by loss of tactile sensibility in the part affected, horripilation and other evidences of vasomotor disturbances are not uncommon. When involving the facial branches of the fifth pair of nerves (the trifacial nerves) it is popularly called tic-douloureux. There are severe flashes of pain over the eyebrows, in the eyes, nose, lips, chin, teeth, etc.

The presence of neuralgia, especially with repeated attacks, usually indicates a weak state of the general system, which may follow long-continued fevers. It may occur during the progress of various acute affections. The causes of neuralgia are various: poor blood and malnutrition, pressure of a tumor upon a sensory nerve, irritation of the nerve from the swelling of an adjacent part, exposure to cold and wet, fatigue, mental emotion, the abuse of tea, coffee and alcohol, etc. The treatment varies with the nature of the different cases. Hot applications and anodyne liniments are often of value. As the pain is severe, persons

affected are too often tempted to resort to narcotics for relief. Such drugs should not be used without the advice of a physician.

The neuralgias of psychogenic origin, which are especially difficult to differentiate, though they constitute about 25 out of every hundred cases, are subject to mental treatment only. This may be of the dialectic variety as given by Dubois, of the emotional type such as that of Dejerine or recourse may have to be had to a thoroughgoing psychoanalysis. As it is fruitless to treat neuralgias of well-known organic origin with psychotherapy, so it is senseless to attempt to do anything with drugs, surgery, hydrotherapy, electricity or massage, in the case of a patient with a purely psychogenic neuralgia. But the physician should be acquainted as far as possible with psychologic methods, because with a symptom so ambiguous as neuralgia frequently is, the slight opportunity he may have to do something with the patient through the mental method may help in the diagnosis, which might otherwise be for him impossible.

NEURASTHENIA (from Greek *νεῦρον* nerve + *ἀσθένεια*, weakness), a condition of nervous debility or exhaustion; popularly called nervous weakness, nervous prostration, etc. The term is now generally applied to a disordered condition of the nervous system manifested by various symptoms. It was originally used in 1879 by Dr. George M. Beard. Nervousness, so called, is manifested chiefly by undue sensitiveness to external impressions. It frequently precedes or progresses into nervous prostration. The distinction between hysteria (q.v.) and neurasthenia is not always plain, for the two affections frequently merge into one another. Neurasthenia is a neurosis, a functional derangement, usually lasting a considerable time, but generally recovered from under proper hygienic and medicinal treatment. No morbid anatomical changes are at present known. The disorder is caused sometimes by various functional and organic affections of the body, but in these instances there is probably a pre-existing basis of functional perverted action of the nervous system. Neurasthenia so produced is known as symptomatic. When certain symptoms predominate, distinctive terms are sometimes used; for example, in acoustic neurasthenia, symptoms of deafness; in gastric neurasthenia, weak digestive action, gastric pain (nervous dyspepsia); in cardiac neurasthenia, palpitations, irregular action of the heart, præcordial pain, etc., symptoms simulating heart-disease; and in cerebral neurasthenia, despondency, irritability, moodiness, sleeplessness, restlessness and confusion of mind, especially in relation to figures.

Neurasthenia is about as common among men as among women, and occurs usually between the ages of 20 and 50, when worry and work are maximal. Signs of a neurasthenic tendency are sometimes seen in young people (of a neuropathic or neurotic diathesis); namely, oversensitiveness, precocity, insomnia, chorea, somnambulism and night-terrors. In girls especially there are also headache, backache, anæmia and lassitude. Sometimes neurasthenia marks the beginning of mental disease, such as melancholia. The causes of neurasthenia may be classified as predisposing (such as heredity and

a neurasthenic tendency), and exciting or acquired. Mental irritability and the loss of self-control in parents are causes. So also gout, syphilis, rheumatism and chronic alcoholism are conditions that transmit neurasthenic tendencies. Improper mental and physical training of children, and too much coddling are often responsible for the affection. Among the exciting causes are injuries; severe mental and physical work for a length of time beyond the individual's power of endurance; worry, especially if associated with lack of rest, of pure air and of suitable food; and the excessive concentration of the thoughts upon one's self. Neurasthenia is sometimes spoken of as "the American disease." This is nonsense as neurasthenia is more frequent among people who have nothing to do than among those who are busy.

The symptoms of neurasthenia are many and various. The individual may appear to be in perfect health, but frequently has a worried look. There may be irritability of temper, fatigue without adequate reason, poor sleep, with exhaustion on waking, headache, with sense of weight or constriction, impaired memory, want of appetite, constipation, various forms of muscular weakness, muscular tremors and contractions, an uncertain gait, a feeling of weariness, giddiness, pain along the spine (spinal irritation) and in the joints, hyperæsthesia, or paræsthesia (numbness and tickling), sexual emissions and defects of sight and hearing. There is no capacity for sustained work. The recognition of mental and physical weakness causes the individual affected to become self-conscious, to distrust others, to have a feeling of isolation, to prefer solitude, to exaggerate trifling impressions, to dread the dark, and to suspect contamination from food, touch, etc. The chief causes of neurasthenia are acute infectious diseases, which cause a lowered nutrition of the bodily functions and various types of fantasy life, with conscious and unconscious masturbation. This last is the most frequent single cause of neurasthenia.

Treatment of this nervous disorder requires time and care. Treatment of the infectious and toxic types require rest and feeding. The change of the maladjusted sex life of the second type will cure or favorably modify the second type. Consult Jelliffe and White, 'Diseases of the Nervous System' (1919). See **PSYCHONEUROSES** and **NEUROSES**.

NEUREUTHER, noi'roi-ter, Eugen Napoleon, German artist: b. Munich, 13 Jan. 1806; d. there, 23 March 1882. He began his studies at the Munich Academy, continued them at Paris (1830) and going subsequently to Rome (1838) fell under the influence of Cornelius (q.v.). In 1848 he was put at the head of the design department in the Royal Porcelain Manufactory at Nymphenburg, a position which he held until the sale of that establishment in 1856. He was engaged from 1868-77 as professor of design in the Royal Institution of Industrial Art. His brilliant versatility is shown in his skill as a house decorator, etcher, painter and industrial designer. He designed the border illustrations for Goethe's 'Ballads and Romances' (1829-40); he published 'Souvenir du 27, 28, 29 Juillet 1830-31'; and 'Bavarian Shepherd's Song with Illustrations'

(1834). In 1835 he painted scenes from Wieland's 'Oberon' for the royal palace at Munich. For the *édition de luxe* of Herder's 'Cid' he produced 70 illustrations. His etchings after Mottmann's frescoes are admirable, and among his oil paintings are to be found in the Schack Gallery at Munich 'Portia's Dream'; 'The Dying Nun'; 'The Villa Mills'; 'The Villa Malta,' and a scene from 'Hermann und Dorothea.' He also furnished designs for the School of Industrial Art, and decorated the ceiling of the staircase and the cupola of the Polytechnique at Munich with graffito painting.

NEURINE, CHOLINE, or SINCALINE, a basic chemical substance having the empirical formula $C_8H_{15}NO_2$, or the constitutional formula $CH_2(OH).CH_2N(CH_3)_3OH$. It occurs in putrefying flesh, in the fly agaric, in ergot, in beet-root juice and in the actively-growing parts of numerous plants. It may be prepared by boiling pigs' bile or ox-brain with baryta. Neurine is a syrupy body with markedly basic properties and a strongly alkaline reaction. It is not poisonous, but may be converted by oxidation into muscarine (q.v.), to which substance the poisonous qualities of the fly agaric are commonly ascribed.

NEURITIS (N. Lat. from Greek *νεῦρον* nerve + *itis*, a suffix denoting inflammation), inflammation of a nerve. Multiple neuritis is the inflammation of several nerves together. Varying with the cause, neuritis is infectious, toxic, traumatic, leprosy, alcoholic, etc. The disorder may be acute or chronic, primary or secondary. It results from an inflammation, swelling and thickening of the nerve-sheath and its prolongations. They may be associated with inflammatory and degenerative changes of the substance of the nerve. The principal symptoms of the disease are persistent burning pain, more or less severe, and a tenderness in the course of the nerve and at the points of its distribution. These are followed by or associated with muscular weakness or paralysis, numbness—loss of sensibility or hyperæsthesia—and atrophy of muscles. The causes of various types of neuritis are numerous; for example, injury to a nerve, as in dislocations and fractures; extension of inflammation from a neighboring part; poisoning by lead, arsenic, mercury or alcohol, syphilis, cancer, diphtheria and infection. The simpler forms of the disease are usually recovered from, under treatment, in a few weeks, although recovery may be imperfect. In severe forms death may occur in from a week to 10 days, from paralysis of the inspiratory muscles, or after several weeks from exhaustion due to continuous pain and bed-sores.

NEUROGLIA, the connective tissue found in many parts of the nervous system, differing very materially in its general structure from that found in other organs, wherefore it has received its special name. It is also sometimes designated as spider-cells, because of the many-branched processes which the cells possess. See BRAIN; NERVOUS SYSTEM, EVOLUTION OF THE.

NEUROLOGY, that branch of science which treats of the structure and functions of the nervous system. It deals with that system under all its aspects of form and condition, both in health and in disease, but especially with its pathological states, its hygiene and its

medical treatment. See NERVOUS DISEASES; NERVOUS SYSTEM, EVOLUTION OF THE; NERVOUSNESS.

NEURON. See NERVOUS SYSTEM, EVOLUTION OF THE

NEUROPTERA, the order of "nerve-winged" insects, so-called by Linnæus from the abundant supporting rods or "nerves" which ramify in a network throughout the wings. Since its establishment the original largely artificial group has been much restricted by the separation from it of large divisions. Typical *Neuroptera* have two pairs of large, equal, richly netted-veined, membranous wings, strong biting jaws, conspicuous, many-jointed antennæ, a free prothorax and a complete metamorphosis. This order is of relatively slight economic importance, but the 8 or 10 families include many common and interesting American insects. See ANT-LION; CORYDALIS; DOBSON; LACEWING, etc.

NEUROSIS (Greek *νεῦρον*, nerve), an affection of the nervous system indicated by disordered sensation, volition, or mental expression, without any recognized lesion of parts, and sometimes without a discoverable adequate cause. Many abnormal conditions are now considered as neuroses; some of them result from nervous dyspepsia, shown by belching and eructation, by spasm and atony of the stomach, due to increased or decreased peristalsis, etc. Cardialgia and cardiospasm (functional disturbances of the heart) may produce such conditions. They are variously described, and include accident-neurosis, a neurosis following a severe injury; traumatic neurosis, following a severe wound; cyclist's neurosis, following excessive bicycle-riding; alcoholic neurosis, due to overuse of alcoholics; occupation-neurosis (see OCCUPATION, HYGIENE OF), indicated by spasmodic manifestations when attempting to perform movements peculiar to the employment of the individual, as the cramps of writers, telegraphers, musicians, dancers, baseball players, milkers, etc.; angioneurosis, a neurosis of the blood-vessels of a part. Herpes zoster is spoken of as vasomotor neurosis, an exanthematous angioneurosis. Other neuroses are kinesioneuroses, indicated by disorders of motion; aesthesioneuroses, indicated by disorders of the sensory apparatus, thermoneuroses, or vagaries in heat perception, secretory neuroses, and mixed neuroses, including acro-neuroses, or disorders of the extremities, sexual neuroses, or disordered functions of the sexual apparatus, and psychoneuroses, in which mental derangement or disorder is concomitant with the physical disorder. Occupation neuroses are quite common; the usual treatment consists of rest, change of occupation, electric and other massages, douches, etc. As a general rule drugs are administered only when necessary to relieve accompanying neurasthenia. Consult Church and Peterson, 'Nervous and Mental Diseases' (8th ed., Philadelphia 1914).

NEUROTIC. As an adjective, this term signifies having relation to the nerves. Physicians speak of neurotic individuals or subjects, neurotic ulceration, neurotic poisons, etc. As a noun the term was formerly chiefly applied in medicine to any substance—drug or poison—which acts especially on the nervous system, neurotics being classified as cerebral (morphine,

etc.), cerebro-spinal (as aconite), and spinal (as strychnine). This use of the word neurotics has become obsolescent, and the term is now mainly reserved for sufferers from nervous disease or excessive nervous activity.

NEUSATZ, noi'zäts, or **UJVIDEK**, ooy'-vë-däk, Jugo-Slavia, a town in the district of Bács, on the Danube opposite Peterwardein. During the Civil War in 1849 it was stormed and taken by the Imperial troops under Jellachich, and almost destroyed by the fire of the insurgents from the castle of Peterwardein. It was rebuilt and is now a thriving trading and educational centre. It contains the Matica Srbska, which is the most important Serbian literary scientific organization in Hungary. It is the seat of a Greek Oriental bishop. Pop. (1910) 33,089.

NEUSE, nūs, a river of North Carolina, which has its rise in the north central part of the State and flows southeast into the Atlantic through Pamlico Sound. Its mouth is an estuary about 30 miles long, and is 10 miles wide at its mouth. It is about 310 miles long and navigable for about 70 miles. A number of streams flow into the Neuse but it has no large tributary.

NEUSIEDLER SEE, noi'zëd-lër-zä (Magyar Fertő-Tava), Hungary, a lake in the northwest, between the counties of Ödenburg and Wieselburg, 30 miles southeast of Vienna. Its greatest length, north to south, is 23 miles, average breadth five miles; circuit about 60 miles. It is saline and shallow, its greatest depth seldom exceeding 15 feet; on the east side it is lost in the great morass of Hanság. Large quantities of salt crystallize on its shores in summer, consisting of a mixture of common and of Glauber salt. It contains abundance of fish, such as carp and pike, some of the latter being 70 or 80 pounds weight. Its frequent inundations occasioned great damage, till a canal was cut in 1800 to carry off its superfluous waters and discharge them into the Little Raab. The water several times has disappeared almost entirely. The last occasion was between 1865 and 1870, when crops were grown on its bed.

NEUSS, nois, Germany, a town of the Prussian Rhenish province, on the Erft, near its junction with the Rhine, 21 miles northwest of Cologne and four miles west of Düsseldorf. It has several fine churches, that of Saint Quirinus, founded in 1209, being a notable transitional specimen from the Round to the Pointed style. The numerous industrial establishments include flour and oil mills, iron foundries, machine works, woolen and cotton factories, paper mills, etc. Pop. 37,224. The town is the Navaesium of the Romans. In 1474-75 Charles the Bold besieged the town. It was sacked by Alexander Farnese in 1586.

NEUSTADT, noi'stät, or **WIENER-NEUSTADT**, vë'nër-noi'stät, Austria, a town near the Hungarian frontier, on the Kerbach, 31 miles by rail, and by canal, south of Vienna. It retains its mediæval walls and is dominated by the 13th century Babenburg ducal castle, converted in 1752 by Maria Theresa into a military academy and noted for its richly decorated Gothic chapel (1460), the burial place of Maximilian I. Locomotives and machinery,

sugar, woolens, cottons, ribbons, starch, leather, pottery, wire, etc., are among the manufactures. The city was founded in 1192 and was rebuilt after the great fire of 1834. Pop. 32,869.

NEUSTRIA, nūs'trī-ä, or **WEST FRANCE**, the name given in the times of the Merovingians and Carolingians, to the western portion of the Frankish Empire, in contradistinction to Austrasia (q.v.), the eastern portion, the term being derived from *ne* (not) and Austria. The division took place at the death of Clovis in 511. Neustria lay between the Meuse, the Loire and the Atlantic Ocean; after the cession of the northwestern portion to the Normans in 912, the name was applied to Normandy, but soon fell into disuse. (See FRANKS; FRANCE). Consult Longnon, 'Atlas historique de la France' (Paris 1889).

NEUTER, a term—formerly applied in zoology to those animals—represented chiefly among the *Hymenoptera*—in which the characteristics of sex are either present in a rudimentary condition or may not be developed at all. They are infertile females. Their status is given in the accounts, in this work, of ants, bees, wasps, and termites.

NEUTRAL NATION, an American Indian tribe of the Iroquois family, residing in the 17th century on the north shore of Lake Erie. The Aondironon, the Wenrehronon and the Ongniaahronon were some of their constituent tribes. In 1626 Father Daillon tried to convert them to Christianity and was favorably received, but the Hurons spread false reports that he was a sorcerer. The French called them the Neutral Nation because they took no part in the long war between the Hurons and the Iroquois. The Hurons afterward made war on the Neutrals and utterly destroyed them in 1651. Consult Hodge, F. W., 'Handbook of American Indians North of Mexico' (Washington 1910).

NEUTRAL SALTS. See SALTS; NEUTRALIZATION.

NEUTRAL STATES. See WAR, EUROPEAN—NEUTRALS AND THE WAR.

NEUTRAL TINT, *in art*, a pigment used in water colors, of a dull grayish hue partaking of the character of none of the bright colors. It is prepared by mixing together blue, red and yellow in various proportions.

NEUTRALITY, *in international law*, a term applied to the status of a state which maintains an attitude of non-interference in respect to an existing war between other states, rendering neither aid nor service to either belligerent in his military operations. The doctrine of neutrality constitutes a large and increasing part of the existing body of international law, but in ancient and mediæval times it occupied almost no place. Grotius, in the first important treatise on international law ever written, gave but an insignificant place to the subject, whereas in any modern treatise it occupies a place hardly second to the law of peace or of war. Among the states of the ancient world the status of neutrality hardly existed. War rather than peace was the normal state of mankind and when it existed practically all nations participated either as principals or allies. If one nation undertook to pursue a neutral policy it had few rights as

such which any of the belligerents felt bound to respect and consequently it was more often to its advantage to choose an able ally as a means of self-protection rather than to remain neutral.

It was among the flourishing maritime states of the Mediterranean region, during the later Middle Ages, that the modern doctrine of neutrality had its origin, and the first recognition of neutral rights was embodied in a famous maritime code, the "Consolato del Mare," which declared that the goods of a neutral were exempt from capture although found on an enemy's vessel. This wise and liberal rule in time came to be adopted by all the European powers and continued as a generally accepted principle of maritime warfare until superseded by the more liberal rule embodied in the Declaration of Paris of 1856. By the latter declaration, which was acceded to by all the nations of Europe and America except Spain, the United States and Mexico, the principle that free ships make free goods was adopted; that is, the goods of an enemy (contraband of war excepted) under a neutral flag, and neutral goods (contraband excepted) under an enemy's flag, are free from capture. The United States refused to give its adhesion to the declaration for the reason that it was disinclined to surrender the right of privateering, the abolition of which was also one of the provisions of the declaration. The United States assumed this position chiefly because of the smallness of its navy and the consequent disadvantage it would suffer in a war with the larger powers were it prohibited from increasing its naval strength by accepting the service of privateers. The government, however, proposed to become a party to the declaration provided a clause were added exempting private property from capture at sea the same as on land but it was never done and the United States has never formally given its adhesion. But as a matter of practice it has observed the rules of the declaration quite as scrupulously as if it had been one of the signatory powers.

Several forms and gradations of neutrality are or were formerly recognized. It may be *qualified*, as where the neutral state is bound by an interior agreement to furnish one of the belligerents a contingent of troops or a sum of money; or *absolute*, as where the state abstains wholly from interference on the side of either belligerent; or *perpetual*, as in the case of Belgium and Switzerland, whose neutrality and inviolability have been guaranteed by the powers upon considerations which have to do with the preservation of the balance of power among European states; or *armed*, as where several neutrals unite for the purpose of enforcing by armed intervention their views of neutral rights as against the aggressions of belligerent powers. The most notable examples of such alliances were the armed neutralities of the Baltic powers in 1780 and 1800 for the purpose of enforcing against England the neutral doctrine that "free ships make free goods." It should be said that international law no longer recognizes the right of a state to maintain a qualified neutrality. If it is under prior treaty obligation to furnish one of the belligerents with men, money or ammunition, however trifling the quantity, it becomes an ally as soon as it undertakes to carry out the treaty stipulations

and is no longer entitled to be treated as a neutral. During the Franco-German War of 1870 the German government appealed to the government of Great Britain to prohibit the sale of arms or munitions to the French, on the ground of *benevolent* neutrality. Such a theory of neutrality cannot be accepted. Benevolent neutrality is no neutrality at all. It is assistance to the belligerent to which it is accorded.

The obligations and rights of neutrals are determined by the rules of international law, not by those of municipal law. They are now defined by two Hague conventions, Nos. V and XIII of 1907. These conventions contain an enumeration of the duties of both belligerents and neutrals, although it is expressly declared that the enumeration is not exhaustive. In this connection it should be observed that in judging of the violation of neutral duties a distinction is made between the acts of a state and those of individuals. The act of an individual in supplying a belligerent with arms or ammunition or in subscribing to his loans is not considered as a violation by the state of its neutral duties, although it might be a violation of municipal law. It is not sufficient that the neutral treat each belligerent with impartiality; he must abstain from giving aid to either except where the ordinary dictates of humanity require, for what might be equality of treatment in form might in effect amount to assistance to one side only. He must not lend either belligerent money, furnish him with troops or ships of war or any article susceptible of warlike use, or allow his territory to be made the basis of hostile operations or for the organization and equipment of hostile expeditions, or as a recruiting ground for the enlistment of troops, or allow prizes to be brought into his ports and there adjudicated, or allow his subjects to aid in the preparation or organization of a hostile expedition against a friendly power. Troops of a belligerent, which are received in neutral territory, must be interned, and belligerent warships are forbidden to remain in neutral waters longer than 24 hours. Likewise their right to make repairs and to take on supplies of coal and provisions is greatly restricted. In the three rules adopted by the Geneva Arbitration Tribunal in the case of the *Alabama Claims* (q.v.), it was declared to be the duty of neutral governments to use due diligence to prevent the fitting out and departure of such expeditions from their territory, to prevent their ports from being made use of by either belligerent for hostile purposes; and to exercise the same diligence in respect to all persons within their jurisdiction in order to prevent any violations of the foregoing duties. The substance of these rules is repeated in The Hague Convention No. XIII of 1907. On the other hand, it is not a violation of neutral duty to discharge the duties of humanity to either belligerent as by allowing a belligerent vessel in distress to seek shelter in the neutral's port for the purpose of obtaining supplies or undergoing repairs or by furnishing asylum to a defeated and fugitive belligerent force. Nor is it at international law a violation of neutral duty when the citizens or subjects of a neutral government in the ordinary course of trade sell to a belligerent firearms or other supplies which the latter may

wish to buy. Likewise neutral persons may transport by ship to belligerents whatever they may want, subject, of course, to the right of the other belligerent to capture and confiscate such articles as may be deemed contraband of war. These are legitimate acts of trade unaffected by war, and neutral governments are not bound to interfere with them or assume responsibility therefor. Nevertheless, during the European War of 1914-18, the governments of Austria and Germany complained of the action of the American government in permitting the sale and transportation for the use of the Entente Allies of large quantities of arms and munitions. The complaint was based on the view that since Austria and Germany had been deprived through the superiority of the British navy of access to American markets, it was contrary to the spirit of neutrality for the American government to permit the furnishing of supplies to their enemies. It was also argued that the immense proportions which the traffic assumed, giving rise as it did to the creation of new and extensive industries, gave a "new aspect to the doctrine of neutrality." The American government, however, declined to accept this view and the trade in arms and munitions continued without restriction. Article 7 of The Hague Convention (No. V) of 1907 declares that a neutral power is not bound to prevent the export of arms or munitions for the use of belligerents. During the European War of 1914-18 Brazil and several neutral powers of Europe placed prohibitions on such traffic, but in the case of the latter powers the measure was not in pursuance of a neutrality policy but rather for the purpose of conserving their own supply of arms and munitions. Finally it is not a violation of neutral duty for one state to recognize the belligerency of another state at war or of a part of a state in rebellion against the established government. Nor is it a violation of neutral duty to recognize the independence of a revolted people when the revolt has reached such a stage as to give reason to believe that the revolutionists will establish their independence as a fact and maintain it.

The above enumeration of the duties of neutrals indicates in a rough way the *rights* which belligerents are bound to respect in the conduct of their warlike operations. They may be comprehended under the general head of complete immunity from the acts of either belligerent within their jurisdiction. No act of hostility may be committed by either belligerent within neutral territory nor within its territorial waters. Nor may a belligerent move his troops through the territory of a neutral state, although this well-established rule has occasionally been violated, notably by Germany in her invasion of Belgium in 1914. Under The Hague Convention No. V of 1907, belligerents are also forbidden to erect within neutral territory wireless telegraph stations for the purpose of communicating with belligerent forces by land or sea. Fugitive troops fleeing from an enemy may not be pursued in neutral territory nor may an armed vessel pursue and capture an enemy's vessel in neutral waters. As a means of enforcing its neutral obligations, it is customary for states to enact *neutrality laws*, so called, making it criminal for their citizens or subjects to do certain specified acts which are

considered to be violations of neutral duties, but such laws neither increase nor diminish the responsibility of the state enacting them. Consequently the state cannot plead the insufficiency of such laws or inability to execute its laws, in extenuation of its offense if it fails to enforce its neutral obligations. The foundation of the neutrality policy of the United States was laid during Washington's administration, when upon the outbreak of war between England and France Washington after a thorough consideration of our obligation to France, under the treaty of 1778, issued a public proclamation announcing that the United States would remain neutral and warned all citizens of the United States to abstain from giving aid to either belligerent. In the year following Congress passed a neutrality act which as modified in 1818 and again in 1828 constitutes in all essential particulars the neutrality law now in force. Some minor changes were made in 1915 and more recently a number of important modifications have been recommended by the Attorney-General with a view to strengthening the existing laws. These laws make it a misdemeanor for any citizen of the United States to accept or exercise a commission to serve a foreign power in a war against a state at peace with the United States; or to enlist or to induce another person to enlist or to go beyond the jurisdiction of the United States to enlist in such foreign service; or to fit out, arm or augment the force of any armed vessel to be employed in such service; or to provide the means for setting on foot any military expedition against a friendly state. No belligerent vessel is allowed to provide itself with military supplies in the territory of the United States, and the President is authorized to use force to send out of our territorial waters any vessel not entitled to remain therein. The neutrality laws of Great Britain are embodied in the Foreign Enlistment Act of 1870 and besides provisions similar to those contained in the laws of the United States they contain detailed and stringent regulations designed to prevent the building or equipping in British jurisdiction of ships intended to be used in war against a friendly power.

JAMES WILFORD GARNER,

Professor of Political Science, University of Illinois.

NEUTRALIZATION, in chemistry, the process by which a solution, originally acid or alkaline, is rendered neutral, or brought into a state in which it is neither acid nor alkaline. If the solution is originally alkaline, it is made neutral by the addition of an acid substance; and if it is originally acid, it is neutralized by the addition of an alkali. A solution of caustic potash, for example, is strongly alkaline and turns red litmus paper blue almost instantly; but if hydrochloric acid is gradually added to it, the alkalinity becomes reduced in proportion to the quantity of acid added, until a state is finally attained in which the solution does not manifest either acid or alkaline properties, and does not affect the color either of red or of

blue litmus paper. It is then said to be "neutralized," the neutralization being due to the fact that the potash has entered into combination with the acid to form a salt (potassium chloride) which is neither acid nor alkaline. If more acid is added than is required to effect precise neutralization, the excess renders the solution acid, and in order to make it neutral again caustic potash or some other alkali must be added. It is often highly important, in chemistry, to effect the precise neutralization of a solution, and a method of quantitative chemical analysis, known as "volumetric analysis," is largely based upon the determination of the quantities of certain standard acid and alkaline solutions which must be added to the given solution, in order to precisely neutralize it. See **CHEMICAL ANALYSIS**.

NEUVILLE, *dè nè-vêl*, **Alphonse Marie de**, French painter: b. Saint Omer, 31 May 1836; d. Paris, 20 May, 1885. While he was for a short time the pupil of Picot, he must be considered largely a self-taught artist developing his talent under the direction of Delacroix. He made his first appearance as a battle painter with his 'Episode in the Crimean War' (1859), followed by 'The Trench of the Mamelon'; 'Zouave Guard' (Museum of Saint Omer); 'Chasseurs Crossing the Tchernaiia'; 'The Battle of San Lorenzo in Mexico.' Meanwhile he was producing numerous illustrations for periodicals and for Guizot's 'Histoire de France.' He served as an engineer in the Franco-Prussian War, and the second period of his artistic activity began. He tickled the vanity and boastfulness of his countrymen by depicting in his glowing and energetic canvases the French as chivalrous heroes, the Germans as barbarians, and became the most popular war painter of "Young France" and the artistic representative of Chauvinism. Among his works with this tendency are 'Bivouac before the Village of Le Bourget' (1872, Museum of Dijon); 'The Last Cartridge at Balan' (1873, familiar through its many reproductions), his panoramas of the battles of Champigny and Rezonville (with Détaillé, 1881, and numerous others frequently reproduced as photographs or engravings and thus widely distributed. He left many aquarelles and drawings which were eagerly bought up.

NEUVILLE, **Jean Guillaume**, **BARON HYDE DE**, French statesman: b. near Charité-sur-Loire, France, 24 Jan. 1776; d. Paris, France, 23 May 1857. He was educated at the Collège Cardinal Lemoine, Paris, and early became an active agent of the exiled Bourbon princes. In 1799 he interviewed Napoleon with the purpose of restoring the throne to Louis XVIII, and later his estates were confiscated; but in 1806 upon his agreeing to exile himself to the United States, Napoleon restored them. With the accession of Louis XVIII in 1814 he returned to France and in 1815 was elected to the Chamber of Deputies. He was sent to the United States as Minister and consul-general in 1816-21 and was then made Ambassador to Portugal, and Minister of Marine (1828). In 1830 he became Secretary of the Navy. He wrote 'An Historical Eulogy of General Moreau,' etc.

NEVA, *ně-vă* (Russian, *nyě-vă*'), Russia, a river which flows from Lake Ladoga, and

after a westerly winding course of 43 miles has its outlet in the Bay of Cronstadt, an inlet of the Gulf of Finland. It is best known as the river on the delta of which Petrograd (q.v.) is built. The river carries to the sea an enormous volume of water from lakes Ladoga, Onega, Ilmen and others equal to that of the Rhine and the Rhône combined; in places it is over 4,000 feet wide, elsewhere narrows to 180 feet, and at one or two points navigation is obstructed by reefs and rapids; it is frozen over during five months of the year. The Neva connects with the Volga by the Ladoga Canal, and thus joins the Baltic with the Caspian Sea.

NEVADA, *ne-vă'dă*, **Emma**, stage name of **EMMA WIXON**, American opera singer: b. Austin, Nev., 1862. She studied in Paris with Marchesi and made her first appearance in opera in London in 1880, as Amina in 'La Sonnambula.' She sang with success in Paris, Italy and in the United States, where she toured in 1885. In 1885 she was married to Dr. Raymond Palmer.

NEVADA, *ne-vă'dă*, popularly known as "the sage-brush State," the name derived from the Spanish *nevada*, signifying "snow-covered": one of the Mountain Division States. It is bounded on the west by California; on the south by California and Arizona; on the east by Utah and Arizona, and on the north by Oregon and Idaho. The sixth in size among the States of the Union, Nevada has an area of 110,690 square miles of surface, 869 of which are water; extreme length north to south, 484 miles, and width, east to west, 321 miles. It lies between the 35° and 45° parallels of latitude, corresponding, on the Atlantic Coast, with the northern boundary of Pennsylvania and the southern boundary of North Carolina. The capital is Carson City.

Climate.—Due to its extreme length north and south and varied elevations, Nevada has a climatic range which is exceeded by but one other State, California. Southern Nevada is semi-tropical; central and northern Nevada, temperate, while certain high valleys and mountain elevations in northeastern Nevada are characterized by extreme winter cold. The atmosphere is clear, dry and almost cloudless. Precipitation occurs chiefly during the winter months and is intercepted largely by the higher mountain ranges. The valleys receive little rainfall.

Topography.—Nevada, for the most part, lies in the Great Basin, a plateau of about 4,000 feet elevation situated between the Sierra Nevada and Wasatch Mountains, none of the streams of which find their way to the sea but empty into inland lakes without outlets or are lost in the sands. A narrow strip along the northern part of the State drains into the Columbia and a portion of the southern part of the State into the Colorado River. There are numerous parallel ranges from 20 to 50 miles apart running north and south through the State, broken by passes, with long narrow valleys between. The valley elevations vary from 1,000 feet, in extreme southern Nevada, to a few valleys in excess of 6,000 feet in the northeastern part. For the most part the valleys are between 4,000 and 5,000 feet elevation. Some of the mountain ranges rise to 9,000 feet. The highest mountain is Wheeler Peak in White

Pine County, elevation 13,058 feet. Other noted peaks are Charleston Mountain, Pilot Peak, Mount Grant, Mount Rose, Freel's Peak, Job's Peak and Mount Jefferson, which are 10,000 to 12,000 feet. Forests are unevenly distributed, with a few areas of commercial forests comprising white and yellow pine, firs, spruces and cedars of great size. In some places the hills are covered with dense growths of juniper, piñon and mountain mahogany. Deciduous native trees comprise the cottonwood, aspen, alder, elder, willow, choke cherry, etc. Aside from the several varieties of sage-brush which clothe the valleys and low hills, there are many native shrubs and bushes and a plant flora remarkable for its varied range. Some of the mountain scenery is picturesque beyond description. The general landscape, however, other than in the comparatively few agricultural valleys, presents great stretches of sage-brush, sandy or alkali wastes, bounded by mountain ranges, the first impression of which is of unutterable loneliness and desolation. This gives place, in time, to the lure of the desert—the sensation of untrammelled freedom in Nature's immensity and delight in the diurnal panorama of the landscape's ever-changing coloration.

Rivers and Lakes.—The rivers are all comparatively small. The Humboldt, 350 miles in length, flows in a southwesterly direction through the northern part of the State and affords the pass through the mountains for the Southern Pacific and Western Pacific railroads. Other important streams are the Truckee, Carson and Walker rivers. The Salmon, Owyhee and Bruneau rivers rise in northern Elko County and flow northerly into tributaries of the Columbia. The Rio Virgin and Muddy rivers, in southern Nevada, flow into the Colorado. A part of Lake Tahoe, one of the most beautiful mountain lakes in the world, is in Nevada. Pyramid Lake, so named from the pyramid-shaped islands of gray stone which rise picturesquely from its deep blue waters, is the largest lake. It is 35 miles in length with a water surface of 390 square miles. Other important lakes are Walker, Winnemucca, Ruby and Washoe. Several of these lakes are remnants of the ancient Lake Lahontan, which in geological times covered a large part of Nevada.

Geology.—The mountains of Nevada show formations of nearly every epoch from the Azoic to the late Jurassic, crumpled and uplifted; ancient erupted rocks which accompanied the Jurassic upheaval; modern eruptive rocks ranging in date from the late Miocene to the Glacial period, and uptilted strata of Cretaceous sedimentaries. The principal rocks are granite, sienite, andesite, dacite, basalt, limestone, slate, sandstone and quartzite. Nevada is one of the most important of the States in the variety, extent and richness of its deposits of precious and valuable metals and minerals. The comparative thinness of the detritus blanket on its mountain slopes has been an important aid to the prospector in discovering the outcroppings of ores.

History.—At the time Nevada was organized as a Territory in 1861, the extreme western portion was locally considered a part of California, known as the "Washoe Country," although the civil government was under the jurisdiction of the Territory of Utah. Nevada was first visited by the white man in 1775, when

Francisco Garcés, a Franciscan friar, stopped here on his way to California. Peter Ogden of the Hudson Bay Company in 1825 visited the Humboldt River, which for a time was called the Ogden. In 1826 Jedediah Smith crossed the State from west to east. Irving's 'Bonneville Papers' describes a visit by members of Captain Bonneville's party to Mary's River, now the Humboldt, about this time. Fremont explored parts of the State in 1843-44-45, discovering and naming Pyramid Lake, Lake Tahoe and the Humboldt and Truckee rivers. The first settlement was made by Mormons in 1849, at Genoa, where a trading post was established. Gold was discovered the same year at Dayton, near Virginia City, by William Prouse. Placer mining on this gulch led, 10 years later, to the uncovering of the famous Comstock Lode, the richest deposit of precious metals ever found in the world. A petition for Territorial government was sent to Congress in 1857 and the following year a provisional government was formed at Carson City with Isaac Roop as governor. In 1860 another petition was sent to Congress and the Territorial delegate applied for admission. The Comstock Lode had now been discovered and a rush of miners from California occurred. Emigrants from the East on the Overland Trail across the State stopped to cast their fortunes with the new El Dorado. Other mining discoveries followed in rapid succession. Virginia City became over night a magic city of Aladdin and the "Washoe Country" became the Mecca of the seekers of fortune the world over. At the outbreak of the Civil War the scanty citizens sent loyal troops to the front. In September 1863 an election was held for delegates to form a State constitution, but the proposition was defeated in January 1864. By the close of the Civil War Nevada had produced \$43,000,000 in gold and silver bullion which was of material assistance to the North. The adoption of the 13th and 14th amendments to the Constitution of the United States required the vote of one additional loyal State, necessitating the admission of another State into the Union. President Lincoln's choice fell upon Nevada. On his recommendation Congress, in March 1864 passed an enabling act. In July the constitution was accepted and Nevada became a State, 31 Oct. 1864, the only State admitted during the administration of the martyred President. The first telegram sent across the continent on the completion of the Western Union Telegraph line, in 1864, was from the Nevada legislature certifying the loyalty of the State. To save delay the constitution of Nevada was telegraphed to Congress for ratification under authority of a special resolution. It is significant that at this time California and Oregon were the only other States west of Kansas. In June 1868 the Central Pacific Railroad was completed and the golden spike which connected it with the Union Pacific driven near Iron Point, Nev. Subsequently the divisional point between the two railroads was established at Ogden, Utah. The Sutro Tunnel, designed for draining the Comstock Lode, was completed in 1879, but not before the "Great Bonanza" was substantially worked out. Other important mining camps which flourished during this period were Austin, Eureka, Aurora, Hamilton, Treasure City,

Gold Hill, Tuscarora, Candelaria, Belmont and Tybo; producing silver, gold and lead. Silver mining was the principal industry. With the fall in the price of silver, due to the Demonetization Act of 1873, mining suffered a decline which continued until the discovery of Tonopah by Jim Butler, in April 1900. At this date the population of Nevada had reached its lowest ebb, 42,335 people. With the decline of mining, however, more attention began to be given to the possibilities for agriculture. It was found that the soils of the valleys were exceedingly fertile and produced profitable crops under irrigation. Canals were constructed to divert the waters of the streams upon the lands until the limit was reached which could be reclaimed without the conservation of waters flowing to waste during the non-irrigation season. This necessitated expensive impounding dams and canal systems. The United States Reclamation Act of 1902 was designed to supply Federal aid for such works, in many instances involving millions of dollars. The first reclamation enterprise undertaken was the Truckee-Carson project in Nevada, which has involved an expenditure in excess of \$7,000,000. While but a comparatively small part of the land area of the State is susceptible of cultivation, due to limitation in quantity of flow of the streams, and this in great part is dependent on the progress of water-storage enterprises, it was early discovered that native forage plants grow in abundance on the public domain, afforded grazing for cattle and sheep. The range livestock industry thus rapidly developed, supplying not only a home market for forage crops produced on the farms but giving definite direction to the general trend of agriculture, namely, to the production of forage crops and livestock. Agriculture thus became responsible for a permanent, instead of ephemeral, industrial population and State development. It is the foundation of the prosperity of the present most important towns: Reno, Fallon, Elko, Winnemucca, Lovelock, Gardnerville, Minden, Yerington and Las Vegas. The population had increased to 81,875 in 1910, and decreased to 77,407 in 1920. Reno is the metropolis, population 12,016.

Political History.—The following executives have served as governors of Nevada:

James W. Nye*	Republican	1861-1864
H. G. Blasdel	"	1865-1870
L. R. Bradley	Democrat	1871-1878
John H. Kinkead	Republican	1879-1882
Jewett W. Adams	Democrat	1883-1886
C. C. Stephenson†	Republican	1887-1890
Frank Bell†	"	1890
R. K. Colcord	"	1891-1894
John E. Jones†	Silver Party	1895-1896
Reinhold Sadler†	"	1896-1898
Reinhold Sadler	"	1899-1902
John Sparks†	Silver-Democrat	1903-1908
D. S. Dickerson†	"	1908-1910
Tasker L. Oddie	Republican	1911-1914
Emmet D. Boyle	Democrat	1915-1922
J. G. Scrugham	"	1923-

* Territorial governor.

† Died in office.

‡ Acting governors.

William M. Stewart and James W. Nye were elected to the United States Senate at the first session of the legislature, in 1864. The former, including an intermission of 12 years, 1877-1889, served as United States senator from Nevada until 1907, a span of 42 years, the longest from beginning to termination of senatorial service in the history of Congress. John E. Jones, Republican, elected in 1873, to succeed

Senator Nye, served continuously until 1903, 30 years, when he was succeeded by Francis G. Newlands, Democrat. The latter was re-elected in 1909 and again in 1915. On his death in 1917, Charles B. Henderson, Democrat, was appointed to fill the vacancy. Other United States senators from Nevada were William M. Sharon, Republican, and James G. Fair, Democrat, elected successively during the 12-year interim in the service of Senator Stewart. George S. Nixon, Republican, who in 1907 succeeded Stewart, was subsequently re-elected but died in 1914. William H. Massey, Republican, was appointed to the vacancy, but was defeated at the ensuing election by Key Pittman, Democrat, who was re-elected in 1916. Following the Civil War and until the silver issue dominated all other political questions (1892-96), Nevada was a safe Republican State. The new Silver party included both Republicans and Democrats and for four successive elections swept the State. The older parties then revived, the Democratic party absorbed the majority of the Silverites and remained in power until the election of 1904 when the State went Republican. Four years later it swung to the Democratic column. At present Nevada may be regarded as quite evenly divided politically. A constitutional amendment giving suffrage to women was adopted in 1914. Under the Initiative and Referendum section of the State constitution a "bone-dry" prohibition law was initiated and voted on in 1918. The State joined the Prohibition ranks on 25 Nov. 1918.

Government.—The State is governed by the original constitution of 1864, as since amended. The most important amendments provide for the initiative and referendum and equal suffrage for women. The legislature convenes biennially the third Monday in January of the odd years, and is composed of a senate of 16 members and an assembly of 37 members. Regular sessions are limited to 60 days; special sessions to 20 days. Assemblymen serve two years, senators four. General elections occur on the first Tuesday after the first Monday of even years. The executive department consists of a governor, lieutenant-governor, secretary, treasurer, comptroller, superintendent of public instruction, surveyor-general, attorney-general and State printer, who serve for four years. There is a Supreme Court, District Courts and justices of the peace. Members of the Supreme Court are elected for six years, district judges for four years. A system of county, township and municipal government is established by the legislature. Cities may be incorporated under special charter. State institutions comprise the University of Nevada and hospital for mental diseases, at Reno; orphans' home, penitentiary and State printing office, at Carson, and home for juvenile delinquents at Elko. Taxation is under the supervision and control of a State tax commission which has direct assessment of public utilities and livestock and general powers of equalization. Water rights are under the control of a State engineer. Employees in all hazardous industries are protected by insurance assessed by a State industrial commission against such enterprises. A railroad and public service commission regulates the tariffs on interstate railroads and other public utilities.

Education.—The public school system is

supported in part from interest on the proceeds (\$3,220,000) of the sales of Federal lands granted to the State for educational purposes, and by direct taxation. The University of Nevada, in addition, receives Federal aid from the Hatch, Adams and Smith-Lever funds. The valuation of university and public-school property is in excess of \$3,000,000. Within recent years expensive modern school buildings have been erected, which will compare favorably with those found elsewhere. Education is compulsory. In 1918 the number of children of school age was 14,762, enrolment 13,915, and average daily attendance 10,884. Rural schools are provided wherever five or more pupils are found in a district. There is a high school in each county. Teachers are well paid and high standards maintained with respect to qualifications. In 1917 there were 439 regular enrolled students in the university and 148 special and short-course students, total 587. The number of men students during the war decreased by reason of enlistments. There is a State Normal School connected with the university and branch normal schools in several counties. The public school system is controlled by a State board of education, a State superintendent of public instruction and five deputy district superintendents. Manual training, home economics and agriculture are taught in the high schools. The agricultural extension division of the university (Smith-Lever) conducts State-wide educational work in agriculture and home economics.

Churches.—The strongest denominations in the State are the Roman Catholic, Protestant Episcopal, Christian Science, Methodist Episcopal, Mormon, Congregational, Presbyterian and Lutheran. Churches of all denominations are found in Reno, including the seat of the bishopric of the Protestant Episcopal Church. In the other towns, usually two or more Protestant churches and the Roman Catholic are represented, according to sect and numbers of the various communicants.

Banking and Finance.—In the State, in 1922, there were 23 State banks and 11 national banks, with combined resources aggregating \$38,031,000. Reno is the principal banking centre, having two national and four State banks; resources, over \$15,000,000; bank clearances for the 12 months ended 30 Sept. 1921, \$37,384,000. The total bonded debt of the State in 1922 was \$1,699,000. The total assessed valuation of property, real and personal, \$214,000,000, an increase of over 233 per cent in 10 years, in part due, however, to increased valuations under the Tax Commission Act of 1913. Treasury receipts in 1922-23 were \$3,700,126; disbursements, \$3,612,733.

Transportation.—Nevada is crossed by three transcontinental railroads, the Southern Pacific and Western Pacific in the northern part and the Los Angeles and Salt Lake in the southern. Branch roads extend to all the principal towns and mining camps. The total operating mileage is 2,325, with 425 miles of sidings.

Commerce and Industries.—In 1910 there were 177 industrial establishments; capital invested, \$9,807,000; value of products, \$11,887,000, and number of employees, 2,670. A very substantial increase has since taken place. The principal articles of manufacture include rail-

road cars, lumber and timber products, flour and grist, packing-house products, beet sugar, chemicals, confectionery, machinery, plaster, dairy products, etc. Cheap hydro-electric power, generated on the Truckee River and other streams, is distributed by wire lines throughout western Nevada for lighting and industrial purposes.

The 1919 census of manufactures reports 166 establishments, engaging 3,563 persons, of whom 136 are proprietors and firm members, 308 salaried employees and 3,119 wage earners. The primary horse power employed to operate these establishments is 19,874; the capital invested aggregates \$16,834,561; the cost of materials, \$16,490,617; the value of products, \$22,874,311, leaving the value added by manufacture \$6,383,694. The amount paid in wages and salaries was \$4,905,687—salaries, \$587,665; wages, \$4,318,022, an average of over \$1,384 per annum for each wage earner, one of the highest averages in the country.

The relative importance of the leading industries are given in the table below:

INDUSTRY	No. of establishments	Wage earners	Value of products	Value added by manufacture
Cars and railroad repairs.....	13	1,750	\$3,992,000	\$2,517,000
Slaughtering and meat packing....	4	118	2,939,000	215,000
Flour and grist mills.....	10	25	1,116,000	125,000
Butter.....	5	17	662,000	62,000
Printing and publishing news-papers, etc.....	34	103	468,000	375,000
Bread and bakery products.....	17	38	274,000	115,000
Automobile repairing.....	17	45	221,000	146,000
Confectionery and ice cream.....	4	10	154,000	64,000

Mining.—The oldest, and at present the second most important, industry is mining. The discovery of the Comstock Lode and its effect on the history of the State has already been detailed, as also something of the story of the rise and decline of mining preceding the discovery of Tonopah in 1900. The surface richness of Tonopah inaugurated a new mining era which, followed by the discoveries of Goldfield, Manhattan, Round Mountain, Rhyolite, Rawhide and other camps in southern Nevada in rapid succession, by 1907 developed nationwide speculation in shares of the mining companies. Some of the mines justified expectations, others did not. The great boom collapsed in 1907-08, leaving a train of disaster in its wake. The industry, however, weathered the storm and re-established itself on a better foundation. Discoveries of new mining districts occurred in other parts of the State, among which being National, Rochester and Gold Circle. The production of the mines, \$19,778,939, in 1907, at the height of the boom, steadily increased to over \$40,000,000 annually during the next decade. The great copper deposits at Ely were developed; 10,000 tons of low-grade copper ores being treated daily at McGill in one of the largest copper concentration plants in the West. Another important copper-producing centre is Yerington. In addition to gold, silver and copper, the State contains large de-

posits of lead, tungsten, antimony, manganese, iron and salt. Nitrates have been found in paying quantities in certain of the old lake beds. No coal of any commercial importance has been discovered, although there are veins of lignite which may yet prove of value. There are vast deposits of shales containing a high per cent of petroleum which may profitably be extracted. With all the discoveries so far made it is believed that the mineral wealth of Nevada has scarcely been touched. The total production of the Comstock Lode to 1918 was \$400,000,000. The total mineral production of Nevada from the discovery of the Comstock Lode to 1918 exceeds \$1,100,000,000. This vast sum has gone to enrich other States; very little of it to develop the permanent wealth of the State in which found. The owners of the dividend-paying mines are largely non-residents. The mining machinery, tools and explosives used, and the clothing, shoes, household utensils and most of the food required by the miners is imported. When the mine is worked out the miners depart. The mining town becomes a "ghost city," with the wealth invested in its buildings, hoisting and reduction works abandoned to the tax gatherer until marked off the list of the delinquent.

Agriculture.—The real foundation of the State's economic wealth and prosperity is agriculture, not mining. By reason of climatic aridity, agriculture, other than the grazing of livestock on the public ranges, is practically limited by the water supply of the streams. The exceptions are comparatively limited areas where the precipitation is sufficient to grow crops under dry-farming methods and certain valleys containing artesian sources of water supply. The acreage of improved land in farms in 1920 was but 594,741 out of the total of 70,285,440 acres within the State. When reclamation works are finally constructed to conserve the entire flows of the streams, it is estimated that 600,000 additional acres of arable lands may be brought under irrigation. Artesian water occurs in a number of valleys at depths of from 100 to 1,000 feet below the surface. While this is being utilized to some extent, economic pressure and land scarcity has not, as yet, caused any extensive development of such underground waters for land reclamation. There are about 100 wells in the Las Vegas Valley, several of which flow large streams, and about an equal number in other parts of the State. The valley soils for the most part are rich in plant foods and under irrigation produce bountiful crops of alfalfa, grass hay, wheat and other grains, potatoes, sugar beets, orchard and small fruits, and vegetables. Forage crops are the principal staples, for which a constant local market is provided for wintering and fattening range cattle and sheep. Potatoes, onions and cantaloupes are exported. Due to excellent markets and the productiveness of the soil, improved farm lands command comparatively high prices, \$200 to \$300 per acre not being uncommon in the more fertile valleys. Southern Nevada is semi-tropical. Experiments with the Egyptian long staple cotton have shown its adaptability to extensive areas in the Moapa and Las Vegas valleys. Almonds, figs, grapes, pomegranates, etc., thrive in this section, but little success has attended the growing of citrus fruits. In the higher valleys of

northeastern Nevada, where the mean annual precipitation is between 12 inches and 15 inches, some success has been obtained in the growing of wheat by dry-farm methods. Recent experiments with certain drought-resistant forage crops, in part native plants, in these valleys, indicate possibilities for very extensive dry-farm reclamation in connection with livestock. The vast public range lands, aggregating 50,000,000 acres, must be taken into consideration as a part of the State's agriculture. Native grasses and other forage plants on this immense area afford subsistence 9 to 12 months in the year for approximately 480,000 beef cattle and 1,500,000 sheep. About 6,000,000 acres of the range lands are within National Forest Reserves. One of the great agricultural problems demanding attention is the extension of Federal control over these open range lands in order that the native vegetation may be conserved from destruction by over-grazing and reseeding practised. Dairying is a profitable industry and is increasing. There are nine creameries and about 25,000 dairy cows. Dairy products to the value of \$832,991 were produced in 1919. The value of all livestock on the farms of the State in 1919 was \$29,893,525; farm crops, \$13,980,303; all farm property, \$99,779,666. Nevada farms are characterized by excessive acreage both of improved and unimproved lands, as compared with other Western States. Until these great "ranches" are subdivided into smaller and more intensively cultivated farms, the agricultural progress of the State will continue to be materially retarded. Happily increasing land values and economic pressures are slowly bringing about such inevitable change.

CHARLES A. NORCROSS,

Director Agricultural Extension, University of Nevada.

NEVADA, Iowa, city, county-seat of Story County, on a branch of the Chicago and Northwestern Railroad, about 30 miles north by east of Des Moines. It is in an agricultural region in which stock-raising is a prominent industry. Its chief manufacturers are flour, brick, tile, lumber and dairy products. It has a large cold-storage plant, and considerable trade in dairy products, poultry, eggs, grain, flour and livestock. The public library contains about 6,000 volumes. Pop. 3,000.

NEVADA, Mo., city and county-seat of Vernon County, on the main line of the Missouri, Kansas and Texas Railroad and a division and hospital point on the Missouri-Pacific railroads; is about 130 miles southwest of Jefferson City and 100 miles south of Kansas City. It was settled in 1830 by a colony from the eastern part of the State, incorporated in 1866, and chartered as a city in 1883. It is in an agricultural and stock-raising region, and in the vicinity of the zinc and coal mines. Its manufactures are chiefly local. The number of men employed in railroad shops and manufacturing establishments is about 1,000. The city has considerable trade in agricultural products and livestock, and is a distributing centre for a large part of Vernon County. Nevada has electric lighting and electric street railway, abundant natural gas with excellent city water from artesian wells, ample fire protection and has a new courthouse, high school and post

office, complete sewage system and paved streets. Its educational institutions are public school, Cottey College for Young Women, opened in 1884, Saint Francis Academy (Roman Catholic), Carnegie Library and the Waltmer Institute of Suggestive Therapeutics established 1897. It has an orphan asylum, the State Lunatic Asylum, Artesian lake, parks and the Missouri National Guard rifle range. The three banks have a combined capital and a surplus of \$400,000, and the Farm and Home Savings and Loan Association of Missouri, strictly mutual with more than \$3,252,000 resources, making it the largest organization of its kind in the State. The government is vested in a mayor and a council of 10 members, who hold office two years; five councilmen are elected each year. Nevada has no saloons. Pop. (1920) 7,139.

NEVADA, University of, was founded at Elko in 1873, removed to Reno and opened in 1886. It is a part of the public educational system of the State, the only school of college grade in the State. Besides the regular collegiate courses in classics, literature, general science, there are courses in civil, mechanical, electrical and mining engineering, and domestic science and agriculture. The Mackay School of Mines, endowed by Mrs. Marie Mackay and Mr. Clarence H. Mackay of New York, specializes in mining education. The Nevada State Normal School is also under the direction of the State University. The Mackay School of Mines gives a prospectors' short course each year which lasts for one month. In the College of Agriculture, short courses in agriculture and home economics are given in connection with farmers' week, which takes place once each year. There is a branch of school mines at Virginia City and another at the city of Tonopah. The University administers the following public service departments: the State Hygienic Laboratory; Pure Food and Drugs and Control of Weights and Measures Laboratory; the State Mining Laboratory; Veterinary Control Service, which administers the quarantine of livestock; Soil and Water Laboratory; conducts the Agricultural Extension Department under the Smith-Lever Act; carries on experimentation in pumping for irrigation purposes; conducts the Agricultural Experiment Station. The degrees conferred are A.B. and B.S. and corresponding masters degrees for graduate work. Women are admitted and constitute scarcely half the number of students. Military drill for men is a part of the curriculum. The university is also the Land Grant College in this State. There are 63 members of the faculty and in 1922-23 there were 825 students registered. The income for the year was \$400,000, while the value of the University property is \$1,110,000.

NEVE, nă-vă, the granular snow-ice that results from the compacting of snow and that represents an intermediate stage in the formation of solid glacial ice. See **GLACIER**.

NEVERS, nê-vâr, France, the capital of the former province of Nivernais, now of the department of Nièvre, picturesquely built on the slope of a hill 600 feet above sea-level, at the influx of the Nièvre to the Loire, 159 miles southeast of Paris. It was the Roman Noviodunum, and has been an episcopal see since 506; its 13th century cathedral has been re-

stored since 1879; the 11th century Romanesque church of Saint Etienne is interesting. The stately courthouse, dating from 1475, was formerly the castle of the Dukes of Nevers. The city contains a fine public garden, a bridge of 14 arches over the Loire, a mediæval gateway, housing a museum of Gallo-Roman antiquities, a public library and a triumphal arch (1746) commemorating the battle of Fontenoy. Its first municipal charter dates from 1194. The industries comprise the manufacture of cannon, iron cables and chains, porcelain (introduced by Italians about 1565), etc. Pop. 27,706.

NEVERSINK HIGHLANDS. See **NAVESINK HIGHLANDS**.

NEVILLE, nêv'il, **Henry**, English actor: b. Manchester, 20 June 1837; d. 19 June 1910. He achieved great success on the London stage, where he first appeared in 1860, and later took the chief rôle in 'The Ticket of Leave Man,' which was his most successful part, and in which he played 2,000 times. In later life he played as principal with Madame Modjeska. He visited America in 1890, opening at Boston as Captain Temple in 'Human Nature,' re-named 'The Soudan.' He was lessee of the Olympic in 1873-77, and established a dramatic school in 1878. Besides plays, such as 'The Duke's Device' and 'The Violin-Maker,' he wrote 'The Stage: Its Past and Present'; 'Gesture' (in Campbell's 'Voice, Speech, and Gesture,' 1895).

NEVILLE, **Richard**, Earl of Warwick. See **WARWICK**, **RICHARD NEVILLE**, **EARL OF**.

NEVILLE'S CROSS, Battle of. See **BRUCE**, **DAVID**.

NEVIN, nêv'in, **Ethelbert Woodbridge**, American composer: b. Edgeworth, Pa., 25 Nov. 1862; d. New Haven, Conn., 17 Feb. 1901. He obtained his musical education in Pittsburgh and in Berlin, and after three years spent in the latter city returned to the United States and opened a studio in Boston. He appeared in public occasionally but his reputation rests chiefly upon his compositions, which date from his 12th year. 'Narcissus,' which has a world-wide popularity, was written when he was 13, and 'O, that we Two were Maying' a year later. Other compositions are: 'A Day in Venice'; 'Cradle Song'; 'Milkmaid's Song'; etc. Consult the 'Life' by V. Thompson (Boston 1913).

NEVIN, **John Williamson**, American Reformed (German) clergyman: b. Shippensburg, Pa., 20 Feb. 1803; d. Lancaster, Pa., 7 June 1886. He was graduated from Union College, Schenectady, N. Y., in 1821 and from Princeton Theological Seminary in 1826, where he remained for a few years as tutor. He was professor of Hebrew at the Presbyterian Theological Seminary at Alleghany City 1829-39, became president of the Mercersburg Theological Seminary in 1840 and was president of Marshall College 1841-53. His translation of Schaff's 'The Principle of Protestantism' created the once famous controversy over 'Mercersburg Theology' (q.v.), of which he was for the rest of his life the principal advocate. He edited the *Mercersburg Review* 1849-53, resigned from the presidency of the Seminary in 1851 and from Marshall College in 1853. In the last-named year the college was removed to Lancaster,

Pa., and merged with Franklin College, Dr. Nevin serving as president of Franklin and Marshall College (q.v.) 1866-76. He published 'The Mystical Presence' (1846); 'The History and Genius of the Heidelberg Catechism' (1847); 'Antichrist or the Spirit of Sect and Schism' (1848). Consult 'Life' by Theodore Appel' (Philadelphia 1889).

NEVINSON, Henry W., English journalist. He was a war correspondent of the *London Daily Chronicle* during the Græco-Turkish war of 1897 in the Transvaal, and Natal during the Boer War in 1899, and in Bulgaria and Albania in 1912-13. He has been on the staff of the *Daily News* and a writer for *The Nation* since 1906. He has published 'Life of Schiller' (1889); 'Neighbors of Ours' (1895); 'In the Valley of Tophet' (1890); 'The Thirty Days' War' (1898); 'Ladysmith' (1900); 'The Plea of Pan' (1901); 'Between the Acts' (1903); 'The Dawn in Russia' (1906); 'The New Spirit in India' (1908); 'Essays in Freedom' (1909); 'Peace and War in the Balance' (1911); 'The Growth of Freedom' (1912); 'Essays in Rebellion' (1913).

NEVIS, West Indies, one of the Leeward Islands, belonging to Great Britain, two miles southeast of Saint Christopher, with which, since 1882, it is administratively connected. It is circular in form, rises in the centre to a wooded ancient crater (3,200 feet), and has an area of 50 square miles. The lower slopes are cultivated, the sugarcane being the principal crop; limes and oranges are grown to a small extent. The capital is the port of Charlestown. Nevis was discovered by Columbus in 1498 and colonized by England in 1628. In the 18th century it was twice taken and restored by the French, and it was a centre for the slave trade. Alexander Hamilton, the American statesman, was born on the island. Pop. 12,945.

NEW, Clarence Herbert, author: b. Brooklyn, N. Y., 1862. He was educated at private schools and at the Polytechnic Institute of Brooklyn, N. Y. He twice traveled around the world, 1880 and 1891, and through South America in 1884, as newspaper correspondent during part of the time. He was shipwrecked on the clipper ship *Eric the Red*, at Cape Otway, Australia, Sept. 1880. He practised as a constructing engineer, 1882-1886; and as editor, author and publisher from 1893. He edited *Truth* (New York 1895); *Reel Life* (1913-14); was manager of the *New York and London Literary Press*, and corresponding secretary of the International Hydrographic Association. He published 'Franc Elliott' (1895); 'Under the Pacific' (1895); 'Chronicles of Murphy's Gulch' (1898). He also published over 400 stories in magazines, newspapers and other periodicals, the best known of which are the series, 'Adventures of a Diplomatic Free Lance' which have run, almost without a break, in the *Blue Book Magazine* for over seven years. Several of them have appeared throughout the United States, Canada and Great Britain as photo-plays. He also wrote 'Mysteries and Adventurers of the Sea,' published in the *Blue Book Magazine*, under the nom-de-plume "Culpeper Sandtt," and in the *Premier and Cassell's New Magazine* of London under his own name. In 1916 he had the misfortune to lose his left arm owing to an attack by a

bear, but with one hand produces his work (averaging 50,000 words each month) upon a typewriter.

NEW, John Chalfant, American financier: b. Vernon, Ind., 6 July 1831; d. 4 June 1906. He was graduated from Bethany College, Va., in 1851 and studied law, becoming clerk of Marion County in 1856. In the Civil War he served as quartermaster of Indiana until his election to the State senate in 1862. He was cashier of the First National Bank of Indianapolis in 1865 and later its president. He was United States Treasurer in 1875-76 and served as Assistant Treasurer in 1882-84. He was appointed consul-general at London in 1889 by President Harrison and was proprietor of the *Indianapolis Journal*.

NEW ALBANY, Ind., city, county-seat of Floyd County, on the Ohio River, and on the Baltimore and Ohio Southwestern, the Pittsburgh, Cincinnati, Chicago and Saint Louis, the Chicago, Indianapolis and Louisville, and the Southern railroads, nearly opposite Louisville, Ky., and about 110 miles south of Indianapolis. It was laid out for a city in 1813, and in 1839 was incorporated. It is two miles below the falls in the Ohio River (see LOUISVILLE) and has extensive water-power. Its chief manufacturing establishments are pork-packing establishments, tanneries, engine and boiler works, furniture factories, flour mills, rolling mills, lumber and planing mills and foundries. It has a large trade in its manufactures, the farm products of Floyd County, and in building material. Some of its prominent buildings are the government building, the city hall, courthouse, the churches and the schools, hospital, new office building, business college. It is the seat of Saint Mary's Academy (Roman Catholic), Holy Trinity Academy (Roman Catholic); it has public and parish schools and a free public library. Within the city limits is a National cemetery in which are 2,908 graves, 676 of unknown dead. The government is administered under the charter of 1839 and provides for a mayor, who holds office four years, and a council. Some of the administrative officials are appointed by the mayor and the others are elected by the council. Pop. (1920) 22,992.

NEW ALBION, the name given by Sir Francis Drake, in 1579, to the western coast of North America, when he landed at Bodega Bay, 40 miles north of the present city of San Francisco, and of which he took possession in the name of Queen Elizabeth. Humboldt and later writers restricted the name to the region between San Francisco and what is now the northern boundary of the State of Oregon.

NEW AMSTERDAM. See NEW YORK.

NEW ARCHANGEL. See SITKA.

NEW ATLANTIS. See ATLANTIS.

NEW BEDFORD, Mass., city, fifth largest in population in the State of Massachusetts, one of the county-seats of Bristol County, on the Acushnet River and New Bedford Harbor, at the head of Buzzards Bay, and on the New York, New Haven and Hartford Railroad, 56 miles south of Boston. It is connected with Fall River, Brockton, Taunton, Wareham, Onset, Dartmouth and Westport by electric lines, and by steamers with New York, Martha's

Vineyard and Nantucket. It was settled in 1652 by John Cook and others from Plymouth, and was a part of Dartmouth until it was incorporated in 1787. It received a city charter in 1847. It was once noted for the number of its inhabitants engaged in the whale fisheries, but since 1860 its whaling interests have decreased and its manufacturing industries increased. The town occupied a prominent place in the Revolution, especially in sending out privateers, which harassed the enemy and captured many of the British vessels. On 5 Sept. 1778 the town was attacked by a British fleet, captured and almost destroyed. The harbor is protected by Fort Rodman on Clark Point. A large lighthouse is on Palmer Island at the entrance of the harbor. The area of New Bedford is nearly 20 square miles. It is well laid out, the streets are clean and nearly all paved. Fine roads along the shore, good views of the sea and electric transit facilities into the surrounding country, all add to the attractiveness of the city. New Bedford stands as one of the leading cities in United States, as an industrial centre; ranking first in the manufacturing of fine cotton goods and fine cotton yarns. The number of cotton-mills employees at the present time is about 38,000. The present capitalization of the cotton mills is in excess of \$52,000,000, owning 68 mills; more than 400,000 bales of cotton are used in the mills yearly. The capital invested in cotton mills is approximately \$100,000,000. There is over \$6,000,000 invested in other industries, including one of the largest twist-drill plants in the world, a rope factory, a copper-rolling mill, a large cut-glass works, a shoe factory, a toy factory, a paint mill and numerous other smaller industries.

New Bedford has about 36,800 feet of water frontage, about 8,016 feet of which has been developed and the wharves are reached by a channel 300 feet wide and 25 feet deep at mean low water and three miles long. Ocean liners engaged in coastwise shipping discharge cargoes at New Bedford. The importance and future possibilities of the port of New Bedford as a shipping terminal was shown in the construction of the mammoth modern pier by the State of Massachusetts at a cost of \$450,000, in addition to the land the pier occupies which was given by the city. A portion of the raw materials for the mills are now brought direct by water to the pier. The area of the pier is 113,000 square feet and the total floor areas of the pier sheds is 90,000 square feet. One section used for storage purposes has a floor space of 31,800 square feet and double railroad tracks under the shed will accommodate 24 cars. New Bedford has always been active in civic progress, and has a civil centre established with many fine buildings, including a new half-million-dollar postoffice, a new county building, remodelled municipal building and one of the finest equipped libraries in New England. Further development of this civic progress includes a new modern hotel and a memorial auditorium. It also has a public park system of seven parks, located in various parts of the city with a total area of approximately 222 acres. The New Bedford Public Library, with 170,000 volumes, is one of the first three public libraries in America and contains the finest collection of whaling prints and

Quakeriana in the world. Two privately-conducted museums, the Bourne Whaling Museum, with a completely rigged whale ship, and the Old Dartmouth Historical Society are visited annually by thousands of visitors to the city. New Bedford has a bi-cameral form of government. The splendid public school system comprises 36 buildings and it also has 11 parochial institutions. It also has one of the largest textile schools in New England, a State institution; the Swain Free School, an advanced institution of art, a public industrial school and a private academy. Three national banks, two trust companies, as well as two savings banks are located in New Bedford. The stock, deposits and surplus of New Bedford banks is about \$58,000,000. New Bedford's drinking water stands high in the State list, coming from one of a chain of lakes 15 miles north of the city. Pop. (1920) 121,217.

There is a large foreign element, chiefly French-Canadian and Portuguese in the city, but all who have made permanent homes are American. Consult Pease, Z. W., 'History of New Bedford' (1918).

NEW BERN, nū'bĕrn (formerly **NEW BERNE**), N. C., city, county-seat of Craven County, port of entry of the Pamlico district, at the confluence of the Neuse and Trent rivers, and on the Atlantic Coast Line and Norfolk-Southern railroads, about 100 miles in direct line southeast of Raleigh, on the Inland Waterway; distributing center for Eastern North Carolina. It was settled in 1710 by a company of swiss and Germans under Baron De Graffenreid. The place was named "New Berne" after Berne in Switzerland. It was incorporated as a city in 1723. It soon became an important southern seaport, on account of its harbor. It was the capital of the Province of North Carolina for several years. It was one of the strongly fortified ports of the Confederacy. (See **NEWBERN, OPERATIONS AT, IN THE CIVIL WAR**). [Annual Mean Temperature 34 year period, 62°. 75 miles from Gulf Stream, causing mild, delightful winters. The chief industrial establishments are lumber and planing mills, grist mills, shingle factories, fertilizing works, ice factory, brick kiln, veneering plants, overall factories, baseball bat factory, tobacco redrying plant, pants factory, toy factory, furniture factory, cotton oil mills, shipyard, carriage factory, lime kiln, and the Norfolk Southern railroad shops, in all having 3,500 employees. There is an extensive trade in lumber, cotton, vegetables, fish, and oysters. The prominent buildings are, a government building (court-house, custom-house and post office), the county courthouse, jail, Saint Luke's Hospital, Elks Temple, National Bank Building, New Bern Banking and Trust Company's building, Shrine Home and home of the Sudan Temple. The educational institutions are the public schools, separate for white and colored. There are 15 church edifices. The three banks have a combined capital of \$375,000. The government is vested in a mayor, board of aldermen and a council of 10 members. The electric-light plant and the waterworks are owned and operated by the city. About 99.3 per cent of the inhabitants are native born Americans. Pop. (1920) 12,198.

NEW BERN, Operations at, in the Civil War. Roanoke Island (q.v.), N. C., was captured by General Burnside, 8 Feb. 1862, and

on 6 March he embarked his troops for an expedition against Newbern, a point of much military importance, at the confluence of the Neuse and Trent rivers, near the head of an extensive and navigable arm of the sea, and connected by railroad with Beaufort Harbor at Moorehead City. By night of the 11th the entire naval and land command was off the mouth of Slocum's Creek, south of the Neuse, and about 15 miles below Newbern. The approaches to the city had been obstructed by sunken vessels and a double row of piles in the river. Four miles below the city, on the southern side of the river and opposite the obstruction in the stream, was Fort Thompson, mounting 13 heavy guns. From the fort inland was a line of rifle-pits and redoubts extending about two miles to and beyond the Atlantic and North Carolina Railroad, and terminating on almost impassable ground. In the fort and on this line were 41 heavy guns and 19 field-pieces. The position was held by seven North Carolina regiments, a battalion of militia and three batteries of artillery, numbering in all some 5,000 men, under command of Gen. L. O'B. Branch. Burnside's troops, 13 regiments of infantry, about 9,000 men and 8 guns, were landed by noon of the 13th, and after a hard march in rain and deep mud bivouacked near the Confederate position, the naval vessels, under Commodore Rowan, moving up the river abreast of the infantry, and shelling the road and woods in advance. On the morning of the 14th the attack was made. Gen. J. G. Foster, with the 10th Connecticut and the 23d, 24th and 28th Massachusetts, moved up a country road on the right; Gen. J. L. Reno on the left, with the 21st Massachusetts, 9th New Jersey, 51st New York and 51st Pennsylvania, moved along the line of the railroad; while Gen. J. G. Parke, with the 4th and 5th Rhode Island and 11th Connecticut, moved in the centre, on a country road, as reserve. Foster began the battle about 8 A.M. by an attack on Fort Thompson and the line near it, maintained the brunt of the contest for some time, and was reinforced by Parke. Meanwhile, Reno had gained ground on the left, the entire division now became engaged and the Confederates, after a resistance of four hours, broke and retreated to Newbern, burning behind them the railroad and turnpike bridges over Trent River. Burnside followed, crossed the Trent in boats, Branch retreating, and in the afternoon the Union troops occupied the city, capturing many heavy guns and other material. The Union loss was 90 killed and 380 wounded. The Confederate loss was 64 killed, 101 wounded and 413 captured or missing.

Confederate Efforts to Recapture Newbern.—The fall of Newbern was a serious blow to the Confederates, but the necessities of the army in Virginia forbade attempt to regain it until after the close of the campaigns of 1862, when troops were sent to North Carolina, and 13 March 1863, Gen. D. H. Hill, who had been assigned to the command in the State, organized an expedition for its recapture. General Daniel's brigade moved from Kinston toward Newbern by the lower Trent road; General Robertson's cavalry brigade was sent by the upper Trent road; and General Pettigrew, with

five North Carolina regiments and 15 guns, was ordered to approach the city near Barrington's Ferry, north of the Neuse, to attack two small gunboats in the river, and capture Fort Anderson, an earthwork on the river, opposite the city, garrisoned by 300 men of the 92d New York. At Deep Gully, a few miles out of Newbern, Daniel attacked five companies of the 25th Massachusetts, supported by two guns, and drove them in, but advanced no farther, as Pettigrew had failed. That officer, at daylight of the 14th, appeared in front of Fort Anderson and demanded its surrender, which was refused, and Pettigrew opened fire from all his guns and engaged the gunboats *Hetzel* and *Hunchhback*, which had been towed into position. The fire of the gunboats, with that of five guns of a battery of rifled guns from the other side of the Neuse, caused Pettigrew to withdraw and cover the movement of the 85th New York to reinforce the 92d. The casualties on either side were insignificant.

On 20 January 1864, General Lee ordered General Pickett, then at Petersburg, Va., to capture Newbern if upon examination he found it practicable, and authorized him to use four brigades of his command for the purpose, in addition to which he promised to assist him with Hoke's brigade of the Army of Northern Virginia. He gave detailed instructions for the movement, and all the Confederate forces in eastern North Carolina were to co-operate and retake Newbern, Plymouth, Washington and other coast towns. On the morning of 30 January the movement began from Kinston in three columns; General Barton, with his own brigade, Kemper's, part of Ransom's, 14 guns and 600 cavalry, was directed to cross the Trent, take the works in front of Newbern in reverse, and cut off communication with the place. Colonel Dearing was sent north of the Neuse with a cavalry force, two infantry regiments and three guns, to attack Fort Anderson. Col. J. T. Wood, with picked crews in boats, was to descend the Neuse, seize the Union gunboats and co-operate with Dearing in the attack on Fort Anderson. General Pickett, with Hoke's brigade, three regiments of Corse's, two of Clingman's, and 10 guns, was to advance by the Dover road. Newbern had been strongly fortified, and was held by 2,000 men, under Gen. I. N. Palmer, and three gunboats were stationed in the Neuse and Trent rivers. An outpost of 300 men of the 132d New York was at Bachelor's Creek, eight miles above Newbern. General Hoke, advancing by the Dover road, on 1 February, at Bachelor's Creek encountered the Union outpost, which was driven in after a severe Federal loss, and Pickett with his column crossed the creek and advanced toward Newbern. The batteries opened upon him; he made no attack, but awaited the result of the co-operating movements. Colonel Wood, with 10 rowboats, carrying picked crews of 15 men each, armed with rifles and cutlasses, left Kinston at noon of 31 January, dropped down the river, and at 4 A.M. of 1 February arrived near the town; but, owing to a fog, he could not locate the position of the gunboats. He finally located the *Underwriter*, moored close in shore, near the wharf, and not more than 100 yards from three batteries; and at night he

boarded her, killing her commander and some of the crew and capturing a third of the remainder in a hand-to-hand conflict. The fires under the boilers of the vessel were very low, and in attempting to tow her out Wood was subjected to fire of artillery and infantry from the forts on shore, and therefore he set her on fire. Pickett waited for Barton's movement, which failed, and after a feeble demonstration he gave up the enterprise and withdrew to Kinston, after a loss of 45 killed and wounded. The Union loss was 326 killed, wounded and missing.

The third attempt on Newbern was made by General Hoke, who after his capture of Plymouth, N. C. (q.v.), 20 April 1864, moved against the place and demanded its surrender, and on being refused began a siege. Hoke was recalled to Kinston, 5 May, and ordered to Petersburg, Va. Consult 'Official Records' Vols. IX, XVIII, XXXIII, XXXVI and 'Battles and Leaders of the Civil War' (Vol. I).

NEW BRAUNFELS, Tex., city, county-seat of Comal County, was laid out in the year 1845, at the foot of a range of hills, 48 miles southwest of Austin, the capital of the State, and 31 miles north of the city of San Antonio, on the International and Great Northern and the Missouri, Kansas and Texas railways. The Guadalupe River, the best water-power river in the State, forms the northeastern boundary of the city limits, and is well stocked with fish. The Comal, which is only about one and one-half miles long, also well stocked with fish, is formed by a great many springs gushing out of the mountain side, about one-half mile from the city courthouse and divides the city. The main streets of New Braunfels are 90 feet wide, all centring on Landa's Park in the heart of the city, known as one of the most beautiful natural parks in the United States. All of these different springs have their own courses and through Landa Park their channels converge into a large reservoir from which the water is used for manufacturing purposes. The city owns its own waterworks system, whence the city's supply is pumped out of two large springs which have a capacity of 3,000,000 gallons daily. The south eastern and the southwestern part of the county is composed of rich black land upon which is produced mainly corn and cotton. The northeastern and northwestern part is mountainous, and is being used for cattle and other stock-raising purposes. The mountainous part of the county is full of wild game, and more deer are killed in Comal County every year than in any other county in the State. The scenery along the Comal and Guadalupe rivers is equal to that of Colorado.

New Braunfels in the year 1853 levied a tax of 30 cents on the \$100 for the purpose of maintaining and establishing a free school system, and in 1856 was granted a charter for 20 years by the State of Texas authorizing the levy of a tax for educational purposes. An attempt to renew this charter at its expiration in 1876 failed because of its unconstitutionality. This system of taxation for school purposes attracted attention all over the State and led to the constitutional provision authorizing the levy of a tax for school purposes. New Braunfels has the distinction of being the cradle

of the beneficent educational system of Texas, and has one of the most beautiful and modern school buildings in Texas. The industrial establishments include a large cotton oil factory, two large modern flour mills, the largest hydrated lime factory in the South, three rock crushers, a large collar factory, a whip factory and two large tanneries. New Braunfels has two newspapers, the *New Braunfels Herald*, published in the English language, and the *New Braunfelser Zeitung*, published in the German language; the *New Braunfelser Zeitung* being established in the year 1852 under the editorship of Ferd. Lindheimer, a noted botanist, who devoted a great portion of his life to the study and classification of the plant life of Texas.

New Braunfels was laid out by a colony of German immigrants, who reached New Braunfels in 1845 under the leadership of Prince Solms-Braunfels, under circumstances of considerable hardships, dangers and sufferings. They had to plow their small patches of ground with a gun hanging on the handle of the plow and guard their stock at all times against depredations by the Indians and Mexican bandits. Pop. about 4,000, of which 3,500 are of German descent, nearly all descendants of the old settlers, and 100 Americans, about 100 negroes and the balance Mexicans.

NEW BRIGHTON, brí'tón, Pa., borough, in Beaver County, on the east bank of Beaver River, two miles from its junction with the Ohio and on branches of the Pennsylvania and the Pittsburgh and Lake Erie railroads, 28 miles northwest of Pittsburgh. It was settled in 1799 by the laborers employed to build Wolf's mill,—a flouring mill, laid out in 1818 and incorporated as a borough in 1838. Coal-fields and fire-clay beds are in the vicinity. It is in a section of the State in which manufacturing and industries connected with coal are prominent. The good water power furnished by Beaver River is utilized in a number of manufactories, chief of which are potteries, coffee mills, flour mills, wire, wall-paper, glass, rivet and nail factories, brick and sewer pipe works, twine factory, iron enameled bath-tub works, fire-engine, keg and brass casting works. There are several churches and public and parish schools. It has the Beaver Valley General Hospital, a public art gallery, a fine government building and library and a park. The banks have a combined capital of over \$1,150,000. The government is vested in a burgess and a council of 12 members. About three-fourths of the population are native-born Americans. Pop. (1920) 9,361.

NEW BRIGHTON. See RICHMOND, BOROUGHS OF.

NEW BRITAIN, brít'n, Conn., city, in Hartford County, on the New York, New Haven and Hartford Railroad, about 11 miles southwest of Hartford. It was settled in 1687 and remained a part of Berlin until 1850 when it was incorporated as a town. In 1871 it was granted a city charter. It is in an agricultural region, but is noted for its extensive manufacturing interests. The chief manufactures are stamped ware, hardware, foundry and machine-shop products, knit goods, hosiery and cutlery. The trade is chiefly in the manufactured goods, but it is a distributing centre for

quite a number of the nearby villages. It has a park, area about 234 acres, well-kept streets and a large number of fine church buildings. It is the seat of a State Normal School and the New Britain Institute. It has a school system second to none in a city of its size. In addition to a high school and grade schools it has a pre-vocational grammar and a vocational high school. The revised city charter of 1896 provides for a mayor, who holds office two years, and a council. Some of the administrative officials are appointed or elected by the mayor and council. The sheriff, city clerk, collector, treasurer and auditor are elected by popular vote. The city elects the school board. The city owns and operates the waterworks. Elihu Burritt (q.v.) was born in New Britain and lived here nearly all his life. Pop. (1920) 59,316.

NEW BRITAIN. See NEW POMERANIA.

NEW BRUNSWICK, Canada, a maritime province, lying mainly between the 45th and 48th degrees of north latitude and the 64th and 68th degrees of west longitude. It is bounded on the south by the Bay of Fundy, on the east by the Straits of Northumberland and Gulf of Saint Lawrence, on the north by the Bay of Chaleur and the province of Quebec, and on the west by the State of Maine. The length of the province from north to south is 230 miles and its greatest breadth 190 miles, and it has an area of 27,985 square miles (a little larger than Scotland) and a sea coast of about 600 miles.

Topographical Features.—Being a portion of the continent, it resembles in its topographical features and climate the adjoining portions of Quebec and New England. It is a rolling country of no great elevation; its loftiest hills are in the northern and northwestern sections of the province and are an extension of the Appalachian Mountains. The scenery is picturesque and varied, but a large portion of the centre of the province consists of one vast forest.

The most marked feature of the eastern highlands of New Brunswick is a ridge of hills almost continuous from Maine to the Saint John River in Queens County, and eastward through Kings County ending in Butternut ridge. This ridge rises 800 or 900 feet above the surrounding country and includes some high peaks, Prospect Mountain and Eagle Mountain near the Nerepis River, Mount Pleasant, Mount Porcupine and Red Rock Mountain in Charlotte County, and Ben Lomond in the county of Saint John. This ridge runs parallel to the coast and is cut through in many places by rivers which flow into the Bay of Fundy east of the Saint John River. There are also five parallel ridges running in an easterly direction and rising to an average of 1,000 feet with valleys between. The highest of these ridges skirts the Bay of Fundy and contains Bloomsbury Mountain and the Quaco hills. It divides into two or more ridges in Albert County, in Caledonia Mountain and Shepody Mountain, the latter being 1,050 feet high. The triangular area of sandstone of the carboniferous period presents a comparatively level surface nowhere rising above 800 feet, the general level, especially in the eastern part of the province, being below 300 feet. The highest land of the province is in the northern highlands. West of the

Saint John River, in York and Carleton counties, it rises into several peaks and ridges to a height of 800 or 900 feet, while the general level is about 500 feet. East of the Saint John River the land rises to the watershed dividing the Tobique and other tributaries of the Saint John from the rivers which flow eastward. Mountains and broken ranges cross this tract of land in all directions and reach the Saint John Valley in the vicinity of Mars hill, which is 1,688 feet in height. The highest elevation in the province is Mount Carleton (2,600 feet).

The coast line of the Bay of Fundy is rocky and bold and indented with several fine harbors, the principal ones being Saint John, Letang and Saint Andrews. On the Bay of Chaleur and Gulf of Saint Lawrence, the shore is less rugged and the harbors are not so deep.

Hydrography.—Few countries are so well watered as New Brunswick. Lakes are numerous and there are many rivers and streams, some of them of large size. The Saint John, which flows into the Bay of Fundy, is 390 miles in length and drains 21,500 square miles of territory. Some of its tributaries are upward of 100 miles in length. Other large rivers are the Miramichi (135 miles), Restigouche, Peticodiac and the Saint Croix.

Soil.—The province presents a considerable diversity of soil. At its southern boundary there is a belt about 30 miles wide along the coast of the Bay of Fundy composed of granite and crystalline rocks, which are much disturbed and thrown up into ridges. North of this belt lies a large part of Sunbury, Westmoreland, Albert and Northumberland counties and the whole of the county of Kent. The western area of this limit is in York County, west of Oromocto Lake, while its southern boundary extends to near the mouth of the Peticodiac River and the northern boundary goes as far as Bathurst. Northwest of this sandstone area the rocks are principally slate and limestone with large deposits of granite appearing in different places. These rocks are much disturbed and are thrown up at various angles forming high ridges and lofty peaks. The sandstones which occupy the middle and eastern part of the province are the newest rocks in New Brunswick. They belong to what is called by geologists the carboniferous period, because deposits of coal are found in them. The rocks lie for the most part flat, or are spread out layer upon layer on the shores and bottoms of ponds and lakes in the form of clay, sand and gravel, carried down by streams and rivers and hardened, after the lapse of ages, into solid rock.

Minerals.—New Brunswick is inferior to Nova Scotia in respect to mineral wealth, but it possesses some valuable ores and abounds in excellent stone. Gypsum, coal and oil with natural gas are successfully exploited. Coal is found in the southern portion of the province at many places and is being worked at Grand Lake and in two or three places in the county of Kent. The seams are thin, but close to the surface and easily reached. Albertite, which appears to be a form of petroleum, is found in the county of Albert, and with it other substances termed bituminous, shale and also petroleum. Wells of the latter are being operated in Westmoreland. Natural gas is sold for distribution in Moncton and Hillsborough.

Iron is found in many portions of the province and has been worked extensively in the county of Carleton; but the most important deposit is in Bathurst County. Copper ore exists in large quantities and has been worked in Westmoreland County. Deposits of nickel, antimony, galena, manganese and graphite also exist.

New Brunswick is abundantly supplied with limestone, the most valuable deposit being in the county of Saint John. Gypsum is found in large quantities and is extensively quarried in the county of Albert. There are large quarries of granite in various parts of New Brunswick, at Hamstead, in the Nerepis Valley and near Saint George in the county of Charlotte. Marble is also found in some localities. Free-stone suitable for building purposes and for the manufacture of grindstones and millstones is also found in many parts of the province. Slate is abundant, and there is clay for the manufacture of bricks in most of the counties. Mineral springs are numerous, the principal ones being in the county of Kings. Salt springs are also found in the same county, and are now being operated with profit. The value of the mineral products of the province, in 1916, is put down at \$878,446.

Climate.—The climate, except on the coast of the Bay of Fundy, is similar to that of Quebec and Maine. The winters are severe and in summer a high temperature prevails, but the climate is healthy and there are no diseases peculiar to the soil. Winter begins early in December and lasts until the end of March. The most charming season is the autumn, which lingers long. The cold weather does not become established until well on in November. The average rainfall is 30 inches and the average snowfall 88 inches. The total precipitation, rain and melted snow, averages 44 inches.

Animal Life.—There is no country in North America in which game is more abundant than it is in New Brunswick. There was a time in the history of the province when, owing to unlawful methods of catching moose, they became scarce, but in recent years, under the protection afforded by the laws enacted by the provincial government, moose are now abundant. The area of land in the interior of the province which is seldom trodden by human feet is so large that moose find there a splendid haunt, and the same is true with respect to other wild animals.

The caribou, which is a smaller animal than the moose and is allied to the reindeer of northern Europe, is also abundant in New Brunswick. Deer are so plentiful as to have become almost a nuisance, and their numbers continue to increase.

New Brunswick has a large number of fur-bearing animals, among which are the bear, the raccoon, the wolverine, the marten, the mink, the otter, the lynx, the muskrat, the woodchuck, the fisher and the squirrel. The hare is also found in great numbers all over the province. This animal turns white in winter.

Wild geese are abundant, and there are no less than six species of wild ducks besides brant. The great haunts of wild geese and of brant are on the north shore, but wild ducks are to be found on the rivers all over the province. There are two species of partridge, although the proper designation of this bird is grouse. Curlew, plover, snipe and woodcock

are also abundant and afford admirable sport. The great northern diver or loon is to be found in all the great rivers. In addition to these, there are two species of eagle, five species of hawks and four or five varieties of owls. These are but a few of the birds of New Brunswick, of which there are about 200 species in all. The government possesses a splendid collection of them, which can be seen at Fredericton.

New Brunswick is pre-eminently the land of the angler, for nearly all its great rivers abound in game fish. The salmon, the king of sporting fish, frequents all the tributaries of the Saint John below Grand Falls, such rivers as the Tobique being famed for that fish. Salmon also are found in all the rivers of the North Shore. The Nepisiguit, the Restigouche and the Miramichi have a world-wide reputation as angling rivers. All the lakes of the province swarm with trout and furnish admirable fishing in their season. There is hardly a stream in the province in which trout are not to be found, and some of the rivers, such as the Tabusintac, are widely famed for the enormous numbers of fish which have been taken in them by sportsmen. In the early summer sea trout of large size swarm in all the rivers which flow into the Gulf of Saint Lawrence. In addition to these game fish other species, which are esteemed in Europe but attract little attention on this side of the Atlantic, such as chub and perch, are very abundant. Pickerel are also to be found in many rivers as well as eels, which frequently attain a large size.

Agriculture.—The leading industry of New Brunswick is agriculture, as the greater portion of its people are farmers. The province contains much excellent land, the marshes at the head of the Bay of Fundy, the intervals of the Saint John and other large rivers, and the uplands of the northern portion of the province being very fertile. Wheat is grown successfully in many districts, but not in sufficient quantities to supply the needs of the province. The largest crops are oats, potatoes, turnips and buckwheat, all of which yield well. A great deal of attention is now being given to dairying. There are numerous cheese factories and creameries in the province which export their products to England and other countries. The government has a department of agriculture which attends to the needs of that important industry.

According to the statistics of 1916 the province had 889,220 acres under crop, of a value of \$22,924,200. The product included 242,000 bushels of wheat, 45,000 of barley, 6,039,000 of oats, 1,206,000 of buckwheat, 7,488,000 of potatoes, 3,165,000 of field roots and 850,000 tons of hay. The livestock consisted in 1917 of 65,169 horses, 100,221 milch cows, 89,456 other horned cattle, 103,877 sheep and 69,269 swine.

Lumbering.—The larger portion of the province is still covered by forests and lumbering is, after agriculture, the principal industry. This business is carried on on a large scale by operators, some of whom own the land upon which they cut their lumber, while others lumber on lands which they lease from the provincial government, which still owns upward of 10,000 square miles of forest. The principal commercial wood is the spruce, which is sawn into deals and sent to England and the United States. Pine, which formerly abounded,

is now scarce. The other forest trees of commercial value are fir, hachmatac, maple, oak, elm, birch, beech, ash, butternut, poplar and hemlock. The value of the lumber cut in 1916 was \$8,384,397, for which Great Britain is the principal market. The abundance of wood of all kinds in New Brunswick at one time made it a great shipbuilding country and the ships of the province were known all over the world. This business has been destroyed by the introduction of steel ships and steamships, and the only shipbuilding now done in the province is the construction of small vessels for the coasting trade. The forests of New Brunswick are a large source of revenue to the government, the amount received for timber licenses and stumpage being in the vicinity of \$420,000 a year.

The principal lumbering rivers of the province are the Saint John, Saint Croix, Restigouche and Miramichi and their tributaries. All the rivers of New Brunswick, of any size, contribute something to the lumbering industry.

Sea Fisheries.—New Brunswick possesses a coast line on the Bay of Fundy, Gulf of Saint Lawrence and Bay of Chaleur of upward of 600 miles, and these waters abound in fish. Although less extensive than the fisheries of Nova Scotia, those of New Brunswick are very valuable, the average product being about four and a half million dollars a year. The two greatest fishing countries are Charlotte and Gloucester, but Westmoreland, Northumberland, Kent and Saint John are also well to the front. The value of the fish caught in the province in 1916 was \$4,737,145.

Manufactures.—The great manufacturing industry of New Brunswick is the conversion of the lumber of the province into deals, boards, clapboards, shingles and similar articles. This industry employs hundreds of saw mills and gives employment to many thousands of men. The province contains four pulp mills for the making of chemical pulp, its value in 1916 was \$591,705. There are five cotton factories in New Brunswick and several iron foundries. The manufacture of nails is carried on extensively. Boots and shoes are made in a number of places, as are wrappers, paper boxes, woolen cloths, candy and soap. There are also furniture and carriage factories. The exports for the year to 31 March 1917 were valued at \$206,173,927, and the imports at \$19,993,584.

Revenue.—The revenue of the Province is mainly derived from subsidies received from the Dominion government and also from the receipts of the Crown Land Office. There is also a revenue from liquor licenses, succession duties, taxes on incorporated companies, fees of office and other sources, the whole amounting (1916) to \$1,580,419 a year. The province expends yearly about \$290,000 on education, \$346,000 on public works, \$47,000 on agriculture, \$33,000 on game protection, \$95,000 on the Provincial Hospital for Nervous Diseases, and \$73,000 on the legislature and executive government. The debt of the province, amounting to \$9,000,000, has been largely expended on subsidies to lines of railway, the construction of permanent steel bridges for the highways and similar services. No direct taxes are levied on the individual by the provincial government.

Education.—The educational system of the province is based on the theory that the property of the community should support the

schools which are free and undenominational. The number of pupils attending the schools is upward of 66,000. There is a normal school at Fredericton for the education of teachers. Besides the common schools there are superior schools and grammar schools in each county and the cities have high schools which take the pupils to the threshold of the university. The University of New Brunswick, located at Fredericton, is maintained by an endowment granted by the province, and is an efficient institution. There are also two denominational universities, Mount Allison at Sackville, maintained by the Methodists, and Saint Joseph at Memramcook, maintained by the Roman Catholics. Consolidated schools, which are formed by the conjunction of three or more school districts, have been established in several counties.

Religion.—There is no State church in New Brunswick, all denominations being on an equal footing. The largest religious body is the Roman Catholic which, at the census of 1901, numbered 144,889. The Baptists come next, numbering 82,106. The adherents of the Church of England number 42,864, Presbyterians 39,207, Methodists 34,558.

Government.—New Brunswick, as one of the provinces of the Dominion of Canada, sends 11 members to the House of Commons and is represented in the Senate by 10 members. For provincial matters there is but one legislative body of 48 members, the Upper House having been abolished in 1892. Every male resident is a voter and responsible government prevails to the fullest extent. The lieutenant-governor is appointed by the government of Canada, but all power rests in the Executive Council or Cabinet, which depends for its existence on having a majority in the legislature. Of the seven members of the Executive Council six are heads of departments. The term of the legislature is five years, but it may be dissolved at any time by the lieutenant-governor.

New Brunswick is divided into 15 counties, each of which is a municipality and is governed by a body elected by the taxpayers which is known as the municipal council and which contains representatives from each parish. Each county is divided into parishes and the parish officers are appointed by the municipal council. There are also three incorporated cities in the province and a large number of incorporated towns, almost every small town having now a municipal government of its own. Liquor prohibition is in force.

Means of Communication.—New Brunswick contains nearly 2,000 miles of railway, the principal lines being the Intercolonial, which is owned by the government of Canada, and the Canadian Pacific. Moncton is the headquarters of the Canadian government railways. The Intercolonial Railway system connects Saint John, Fredericton, Chatham and other important New Brunswick towns with Quebec and Montreal. The construction of the Intercolonial Railway was one of the terms upon which the maritime provinces agreed to enter confederation in 1867. The Canadian Pacific Railway has its Atlantic terminus at Saint John, and it connects that city as well as Fredericton, Woodstock, Saint Andrews and Saint Stephen with Moncton and the west. A large portion of the winter traffic of Canada and of the State of Minnesota passes over its road, through

New Brunswick to the port of Saint John where there are deep water wharves and elevators. Several lines of steamships run between Saint John and Great Britain during the winter. Vessels of a tonnage of 50,147 tons were owned in the province in 1916. The highway roads of the province have a total length of upward of 12,000 miles and are well kept up by the department of public works. The bridges number upward of 4,000.

Cities and Towns.—New Brunswick contains three cities and a number of towns which are rising into importance. The largest of these is Saint John (q.v.), situated at the mouth of the river of that name. It is a large shipping port and lines of steamships run from it in winter to Great Britain, carrying the produce of western Canada to European markets. It has railway connection with the west by means of the Canadian Pacific and Intercolonial railways. Saint John is also a considerable manufacturing centre. Its population is about 53,000.

Fredericton, with a population of over 7,000, situated 84 miles up the Saint John River, is the capital of the province. It is the centre of an important agricultural district and the seat of some manufacturing industries. Moncton, which has upward of 11,000 inhabitants, manufactures to a considerable extent, besides being a great railway centre.

Chatham, at the mouth of the Miramichi River, is an important port for the shipment of lumber to Europe. Among the other towns of the province that are worthy of mention are Saint Stephen, Saint Andrews, Woodstock, Edmundston, Sussex, Dorchester, Sackville, Richibucto, Shediac, Newcastle, Dalhousie, Hillsborough and Campbellton.

History.—The first European settlement in the province was made by De Monts and Champlain on Saint Croix Island, near the entrance to the Bay of Fundy in 1604. It was a part of the French Province of Acadia, and after the downfall of French power it was a part of Nova Scotia until the year 1784. Fort Latour, at the entrance of the Saint John River, was the scene of the contests between Latour and Charnisay for the mastery of Acadia and of the heroic deeds of Lady Latour. It was captured and destroyed in 1645. Fort Beausejour, at the head of Chignecto Bay, a stronghold of the French, was taken by the English in 1755. At the close of the War of the Revolution many loyalists who had taken the side of the king in the contest came to New Brunswick and a number of the Loyalist regiments were disbanded in the province where their descendants still live. After the close of the Napoleonic wars, and again after the Irish famine of 1847, large numbers of immigrants came to the province. About 100,000 of the inhabitants are of French origin, descendants of the Acadians who settled in the country in 1634. The others are of the British races, the English predominating. The population of the province in 1921 was 388,092 (over 90 per cent of Canadian birth).

JAMES HANNAY,
Author of 'New Brunswick: Its Resources and Advantages'; Revised by D. S. DOUGLAS,
Toronto.

NEW BRUNSWICK, N. J., city, county-seat of Middlesex County, on the Raritan River, the Delaware and Raritan Canal and on the Raritan River and the Pennsylvania Rail-

road, about 25 miles north by east of Trenton, 30 miles west by south of New York, and 15 miles from the mouth of the river. It was settled in 1681, and until 1697 was called "Prigmore's Swamp." The name was changed to "Inion's Ferry," and in 1714 it was again changed and called New Brunswick after the House of Brunswick. In 1730 it was granted a royal charter; in 1736 it was incorporated as a town, and in 1784 was chartered as a city. It was an active centre during the Revolutionary War, and was occupied by the British in the winter of 1776-77.

It is a manufacturing city, and has considerable trade, with good shipping facilities by land and water. The chief manufacturing products are red cross supplies, cigars, automobiles, wall paper, rubber tires and tubes, linoleum, horse-shoe calks, hosiery, music wire, cigar boxes, etc. It is the seat of Rutgers College (q.v.), the State Agricultural and Mechanical College and the Rutgers Preparatory School and Saint Agnes Academy. The Theological Seminary of the Dutch Reformed Church is connected with Rutgers. It has a new high school, built at a cost of \$175,000; nine public schools, four parochial schools and a young ladies' seminary; the Gardner A. Sage library contains about 50,000 volumes and the public library contains about 30,000 volumes; the Saint Mary's Orphan Asylum and Home for the Aged is in charge of the Sisters of Saint Francis. There are two hospitals and also a hospital for incurables. The city is governed under the commission form of government consisting of a mayor and four commissioners. It has a full paid fire department and motor-drawn apparatus. The board of education is appointed by the mayor. It has 141 acres of public parks. The city owns and operates the waterworks. Pop. 32,779.

NEW CAANAN, Conn., town in Fairfield County, on the New York, New Haven and Hartford Railroad and on Five Mile River, eight miles northeast of Stamford and six miles northwest of Norwalk. It is a beautiful residential town and a favorite summer resort for New York business men. The surface is hilly, the altitude about 400 feet, and the climate cool in summer and temperate in winter. Well-kept roads extend into the country and to the beaches on the Sound. The principal industry is the manufacture of shirts and overalls. A handsome town hall, school, public library and reading room, the Mead Memorial Park and Brooks Sanitarium are prominent municipal features. Pop. (1920) 1,918.

NEW CALEDONIA.—An island belonging to France, situated almost in the antipodes of that country between 161° and 165° E. long. and between 20° and 25° S. lat., and this geographical situation became much enhanced when the Panama Canal was opened. In fact, it is only necessary to glance at a map to realize that, placed between Australia and the Melanesian and Polynesian islands, New Caledonia is on the route from Sydney to San Francisco and Panama, passing by Fiji, Samoa, Tahiti and the Marquesas Isles on the one hand, and the route from New Zealand to Indo-China via the Solomon Isles, New Guinea, Java and Sumatra, or in other words, it is admirably placed, once it is properly developed, to become the emporium of the Pacific.

History.—The existence of New Caledonia was foreseen by Bougainville during a voyage round the world which he made in 1766 to 1769, but he did not endeavor to approach it and the honor of discovering the island fell to the famous explorer Cook in 1774, while returning from the New Hebrides which he had just explored. He approached it from the north-east at Balade, and gave it the name it still preserves on account of the resemblance of the country to certain parts of the coast of Scotland. It is practically certain that La Perouse visited New Caledonia in 1788 before being lost on the neighboring islands, but no trace has been found of his visit there. A little later in 1792-93 d'Entrecasteaux explored the island, but it was only in 1843 that the first Europeans settled there; these were the French Maristes priests which *Le Bucéphale* brought there while returning from Tahiti. Several of their number were massacred, as well as some French sailors. In order to avenge them Napoleon III caused the island to be occupied by Rear-Admiral Febvrier-Despointes in September 1853. A penitentiary colony was established by decree of 1859 and in 1864 the first batch of convicts arrived there.

From a geographical point of view, New Caledonia, which has an area of about 20,000 square kilometers (7,722 square miles), forms part of an Oceanic continent, which has sunk gradually and of which there only remain a few high summits. It has the form of a very elongated ellipse, the greater axis of which inclines about 45° to the meridian. A very irregular but continuous mountain chain stretches from one end to the other of the island, which it separates into two parts; there are fairly high mountains like Humbolt and Panie, their altitudes being about 1,650 metres (5,406 feet). From this mountain chain extend numerous buttresses which form so many valleys, in each of which more or less important water courses flow—such as the Diahot—which never dry up in the mountain regions, being fed less by the infrequent rainfall than by the moisture deposited by the clouds covering the higher parts.

By reason of its geographical situation, New Caledonia must be considered as a tropical country, though its climate is rather temperate than tropical; moreover, it is healthy and Europeans can cultivate the land without risk.

Inhabitants.—The population is estimated at about 50,000, and the male inhabitants are known as Canaques. They belong to two distinct races: Melanesians and Polynesians, who have, however, intermarried, thus creating intermediary types.

Government.—New Caledonia is governed by a resident governor at Noumea, with the assistance of a privy council of the principal heads of departments and influential inhabitants; a general council is elected to supervise. The colony has no senator nor deputy but only a delegate elected to represent it at the higher council of colonies.

Commerce.—The exports in 1913—the last normal year—amounted to 15,838,405 francs (\$3,167,681), products from the land figuring for 13,745,028 francs (\$2,749,005) in this total. If we deduct from this figure the value of guanos, 84,000 francs (\$16,800), and of ores and minerals, 8,441,428 francs (\$1,688,285), there remain 5,219,500 francs (\$1,043,900) for

the total of the other products of the country, i.e., agricultural, forestal and fisheries. Among the products of a vegetal origin, copra takes the first place and its exportation shows 2,960 tons of a value of 1,744,000 francs (\$348,800); coffee figures next with 421 tons of a value of 1,027,000 francs (\$205,400). The total cotton output gives an export figure of 269 tons of cotton seed, representing a value of 24,000 francs (\$4,800), and 163 tons of cotton valued at 250,000 francs (\$50,000).

Products, etc.—Among the cultivated plants giving aromatic essences are balm mint, whorl plant, and especially niaoubé, which is abundant and is used in the production of an oil of which the colony could export considerable quantities. In 1913 the colony exported 3,565 kilograms (7,857 pounds) of volatile oil or essences, of a value of 19,290 francs (\$3,858).

The natives cultivate especially maize, rice, manioc and numerous varieties of yams and potatoes, and particularly taro. The forests contain many varieties of wood, of which nissouli, proper to New Caledonia, is mostly exported; then come sandal wood and damara, which produces the resinous kaori gum; in 1913 26 tons of sandal wood were exported, representing a value of 14,000 francs (\$2,800), and 2,507 kilograms (5,524 pounds) of kaori of a value of 3,500 francs (\$700).

The livestock comprises about 130,000 oxen. These are good animals for butcher's meat, weighing on an average 450 to 500 kilograms (900 to 1,100 pounds). The meat is mostly canned before being exported. In 1913 it was 436 tons. Among the fish products, mother of pearl figures for 1,005 tons representing 830,665 francs (\$166,133 and sea-slugs for 23 tons valued at 23,750 francs (\$4,750).

The mineral riches of New Caledonia comprise nickel and chrome outcrops, cobalt, copper, lead, zinc, silver, gold. Antimony and mercury deposits are also said to exist in certain parts. The transformation in the colony of nickel ore into mats is now capable of commercial realization which speaks well for the future of New Caledonia.

Dependencies.—The Dependencies of New Caledonia are of little importance. The small Island of Pines, which serves as the central supply depot, is a madreperic rock. The Loyalty Islands are covered with forests. The Huon Islands are not inhabited but have been exploited for their abundant deposits of guano and quantities of tortoises which frequent the pink sand banks. In the Chesterfield Island guano and mother of pearl is sought after, or whale and tortoise fishing. The New Hebrides (q.v.) are more important. Situated between 21° and 13° south latitude they are hotter and less salubrious than New Caledonia; they comprise some 40 island divided into two groups: the Torres Isles and the Banks Isles at the north, and New Hebrides proper at the south. They cover 1,500,000 hectares (3,706,500 acres), and have a population of about 60,000 canaques and 250 Europeans.

Visited by Bougainville, Cook and La Perouse they were annexed at the same time as New Caledonia in 1853 and occupied by France in 1886. But as a result of protestations by the Presbyterian missionaries, the small garrison was withdrawn and France signed agreements with England on 16 Nov.

1887 and 26 Jan. 1888 establishing the condominium of England and France. The Anglo-French agreement of 1904 provided for the establishment of a mixed commission to settle litigation concerning real estate and a commission of February 1907 established an Anglo-French Protectorate over the islands. The principal centre is Port Vila in communication once a month with Noumea and Australia by a boat belonging to the Société des Nouvelles Hébrides. The soil is of remarkable fertility; it is quite likely even that it reserves many a surprise for mine prospecting. Finally, this archipelago possesses a considerable reserve of labor.

The Wallis and Horn island since 1844 have been placed under French protection; their exportations consist of copra, kava roots, "fan" matting, etc. These two archipelagos are only in intermittent communication with France by men-of-war which visit them every year. Consult Bernard, Augustin, 'L'Archipel de la Nouvelle Calédonie' (Paris 1895); Blanc, 'Les Îles Wallis (ib. 1912); Jeannency, A., 'La Nouvelle Calédonie agricole' (Paris 1894); Legrande, M. A., 'Au pays des Canaques' (Paris 1893); Salivis, P. A. de, 'Marins et missionnaires: Conquête de la Nouvelle Calédonie, 1843-1853' (Paris 1892).

NEW CASTILE, käs-tél', Spain, an ancient province, corresponding to the ancient Moorish kingdom of Toledo, and now forming the provinces of Madrid, Ciudad-Real, Cuenca, Guadalajara and Toledo, occupying nearly the centre of the peninsula within the basins of the Guadiana, Tagus and Júcar; it had an area of 28,010 square miles, and the population of the region in 1910 was 2,150,000. With the province of Old Castile which bounded it on the north, and is now divided into the provinces of Avila, Burgos, Logrono, Palencia, Santander, Segovia, Soria and Valladolid, area, 25,490 square miles, pop. 1,850,000. New Castile formed the kingdom of Castile which was instrumental in expelling the Moors from Spain (q.v.).

NEW CHURCH. See CHURCH OF THE NEW JERUSALEM.

NEW-CHWANG, nū-chwäng'. See NIU-CHUANG.

NEW COLLEGE, Oxford, England, was founded in 1379 by William of Wykeham, bishop of Winchester and lord-chancellor of England, as the College of Saint Mary of Winchester, the scholars to be recruited from the most promising pupils of the great public school of Winchester (q.v.). Its original establishment comprised a warden, 70 fellows and scholars, 10 chaplains, 3 clerks and 16 choristers; its modern establishment comprises a warden, 28 fellows, 2 chaplains, 39 scholars, 8 lay clerks and 18 choristers. The scholarships are divided into two classes, Winchester and open. Forty church presentations are within its gifts. The college buildings are among the finest in Oxford, and originated the style of English college architecture; the chief features are the hall, the chapel and the gardens. Among celebrities associated with the college are Vitelli, Grocyn, Archbishop Chichele, Bishops Waynflete, Lowth, Ken and Sydney Smith. Consult Rashdall and Rait, 'New College' (London 1901).

NEW COMERSTOWN, küm'ërz-town, Ohio, city, in Tuscarawas County on the Tuscarawas River, and on the Pennsylvania and the Pittsburgh, Cincinnati, Chicago and Saint Louis railroads, about 80 miles east by north of Columbus. It is in a fertile agricultural region, near bituminous and clay deposits. The chief manufactures are lumber and planing mill products, cigars, brick and dairy products. Pop. 3,389.

NEW CONNECTION METHODISTS, the first secession from the English Wesleys, dating from 1797. The New Connection comprised the followers of Alexander Kilham (hence sometimes called KILHAMITES), who, in 1795, published 'The Progress of Liberty,' a criticism of the lax church discipline of the day, and in which he contended that the members of the various societies of Methodists and not the Conference should be the source of authority in the church, and claimed lay representation equal with ministers in the Conference. In 1796 he was expelled from the Conference, three other ministers joined him in the following year, and the body soon had 5,000 adherents. It was never large in its membership, and in 1907 it joined with the United Methodists and the Bible Christians to form the United Methodist Free Church. The united church had in 1916 671 ministers, 2,727 churches and a membership of 157,852.

NEW CREEK (Keyser), Engagements at. While Gen. J. E. Johnston was at Winchester, Va., 14 June 1861, he heard that Col. Lew Wallace, with the 11th Indiana regiment, had marched from Cumberland, Md., and driven a Confederate force from Romney. Believing it to be the advance of McClellan's column from West Virginia, Johnston ordered Col. A. P. Hill, with three regiments, to march on Romney, 45 miles, west, drive out Wallace, and destroy the bridges on the Baltimore and Ohio Railroad west of Cumberland. Hill reached Romney, but Wallace had fallen back to Cumberland. At night of the 18th Hill sent Colonel Vaughn, with four companies of infantry, to destroy the bridge of the Baltimore and Ohio Railroad over New Creek, guarded by about 200 local militia and two guns. Vaughn crossed the north branch of the Potomac, beyond which the Union troops had taken position, and put them to flight, captured the two guns and a set of colors, burned the bridge over the mouth of New Creek, and then pushed on to Piedmont, five miles westward, destroyed parts of the railroad and cut the telegraph wires, and then returned to Winchester. Later the position at New Creek was fortified and garrisoned to protect the railroad bridge. On 4 Aug. 1864 it was held by Col. Robert Stevenson of the 154th regiment Ohio National Guard with his regiment, small detachments of three other regiments, and eight guns, in all about 1,500 men. During the day Stevenson was attacked by Gen. John McCausland, who, returning from his raid on Chambersburg, had approached by way of Romney. After a severe fight of several hours McCausland withdrew toward Moorefield, leaving several dead and severely wounded on the field. The Union loss was 8 killed, 29 wounded and missing. On 27 Nov. 1864 New Creek was held by Colonel Latham, 5th West Virginia Cavalry, with about

700 dismounted cavalry, four heavy guns and three field pieces. On the morning of the 27th General Rosser with two brigades of cavalry, his own and Payne's, crossed Great North Mountain into Hardy County, surprised and captured Latham's pickets, charged over his works and captured his artillery and most of his command with but slight resistance. The prisoners taken numbered about 500, and with them their arms and some colors. Four of the seven guns, being heavy pieces, were spiked and left, the carriages being burned. All the government buildings, containing a large amount of ordnance, quartermaster and commissary stores and 200 wagons, were burned, and Rosser marched away with his prisoners, three guns, about 250 horses, also several hundred head of cattle and a large number of sheep collected from the farms of Hardy and Hampshire counties.

NEW CUMBERLAND, W. Va., town, county-seat of Hancock County, on the Ohio River, and the Pittsburgh, Cincinnati, Chicago and Saint Louis Railroad, about 35 miles north of Wheeling. In the vicinity are coal mines and valuable clay beds. The chief manufactures are sewer pipe, tile, a semi-porcelain pottery, fire and paving brick, foundry products and machinery. It has large mills where the fire clay, for use in the iron works, is pulverized. It has an extensive trade in coal and clay products. Pop. 1,816.

NEW DECATUR, de-kā'tér, Ala., city, in Morgan County, near the Tennessee River. and on the Louisville and Nashville Railroad, about two miles south of Decatur and 85 miles north by west of Birmingham. The first settlement was made in 1887, and in 1889 it was incorporated. It is an agricultural, lumbering and manufacturing section of the State. Its industrial interests are connected with the manufacturing and shipping of iron products, lumbering and farm products. It has a good trade in wool. It is governed by a mayor and council under a revised charter dating from 1899. Pop. (1920) 4,228.

NEW ENGLAND, a collective term applied to the northeastern portion of the United States, comprising the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut. It extends from lat. 41° to 48° N., and from lon. 67° to 74° W., with an aggregate area of 67,384 square miles and a population at present of about 7,000,000. It has a coast line of about 700 miles, without allowing for the smaller inlets, and constitutes a large part of the great peninsula which, including Nova Scotia, New Brunswick and parts of Lower Canada, is formed by the Atlantic Ocean, the Saint Lawrence, and the connected waters of Lakes Champlain and George and the river Hudson. It was originally granted for colonization by James I in 1606 to the Plymouth Company under the name of North Virginia, and received its present name from Capt. John Smith, who in 1614 explored and made a map of the coast. For the details of the geography and history of New England, consult the States respectively of which it is composed, and also the United States. Consult Palfrey, 'History of New England.'

NEW ENGLAND, A Compendious History of, by John Gorham Palfrey (q.v.). It

covers the time from the first discovery of New England by Europeans down to the first general congress of the Anglo-American colonies in 1765, with a supplementary chapter giving a summary of the events of the last 10 years of colonial dependence, and was published 1865-73.

NEW ENGLAND EMIGRANT COMPANY, The, in *American history*, a corporation organized at Boston in 1855 to control emigration to the Territory of Kansas in the interest of the anti-slavery party. The Emigrant Company aided largely in making Kansas a free State.

NEW ENGLAND HISTORIC AND GENEALOGICAL SOCIETY, The, an association organized in Boston, Mass., in 1845 for historical research and the preserving of early New England records. Meetings are held every month and the membership is about 1,000. A quarterly magazine, *The New England Historical and Genealogical Register*, was begun in 1847 and the Society also publishes the *Bibliopolist* for circulation among its members. It issues also 'Vital Records of Massachusetts Towns' ending at 1850. The library of the Society contains 40,000 volumes, and in addition many pamphlets, relics, manuscripts and curios. The Society has a valuable collection of old prints and paintings.

NEW ENGLAND ORDER OF PROTECTION, an American fraternal and beneficial society organized in 1887 by members of the Knights and Ladies of Honor who sought an independent authority for New England. The central lodge is located in Boston. Membership is confined to New Englanders. In 1917 it had six grand lodges, over 350 sub-lodges and 49,350 members. In 1917 it disbursed \$1,114,110 in benefits, and \$15,038,706 since its organization.

NEW ENGLAND PRIMER, a famous educational work, compiled by one Benjamin Harris, an English versifier and printer, who established a nondescript shop in Boston during the reign of James II. He first published 'The Protestant Tutor,' and before 1690 the 'New England Primer' as an abridgment of the earlier work. It is thought that in the 18th century about 2,000,000 copies were sold, yet of these less than 50 are known to be extant. These surviving copies represent about 40 editions. Only a small portion of the supposed 1st edition is in existence, this so-called 'Bradford Fragment' having been discovered as waste in the binding of a later work. The contents of the 'Primer' was variously altered in accommodation to religious and political changes. The alphabet rimes, with wood-cuts crude as themselves, are probably the best-known feature. One of the most curious of these illustrations shows Job literally covered with spots. The shorter Westminster Catechism is also included. P. L. Ford (q.v.) did much to clear up the subject of the 'Primer' by his historical bibliographical study, 'The New England Primer: A History of its Origin and Development, with a Reprint of the Unique Copy of the Earliest Known Edition' (New York 1897). A reprint was issued (Albany 1899).

NEW ENGLAND SHILLING, the name given to the first American colonial coins issued

in 1652. They were of the value of "12d, 6d and 3d peeces," stamped N E on the face and XII, VI or III on the reverse to denote the value. See NUMISMATICS.

NEW ENGLAND THEOLOGY, a Calvinistic school of theology, originated in New England by Jonathan Edwards (see EDWARDS, JONATHAN). This school was controversially opposed to Arminianism (q.v.), and later to Unitarianism (q.v.). A new element was introduced into the theological atmosphere of New England by the preaching of Universalism (q.v.) by John Murray 1770. The controversies of the early 19th century resulted in the crystallization of New England Theology into a complete system, comprising the tenets, that sin is voluntary; that depravity is inherited from Adam; that repentance or turning to God can only result from preventing grace; that man has complete freedom of will; that holiness consists in unselfish love; that certain persons are predestined to receive the grace of God which leads to repentance. Modern philosophy and criticism have dissolved the dogmatism of this theology which is no longer taught in an unmodified form in Congregational seminaries. Consult Boardman, E. N., 'New England Theology' (New York 1899); Foster, F. H., 'A Genetic History of the New England Theology' (Chicago 1907); Walker, W., 'History of the Congregational Churches in the United States' (New York 1894).

NEW ESSAYS: OBSERVATIONS, DIVINE AND MORAL, collected out of the Holy Scriptures, Ancient and Modern Writers, both Divine and Human: as also out of the Great Volume of Men's Manners: tending to the furtherance of Knowledge and Virtue. By John Robinson (q.v.). (1624). A volume of 62 essays, on the plan of Bacon's, but at greater length, and in ethical, religious and human interest more like Emerson's 'Essays' in our own time: the work of an English clergyman and scholar, in exile at Leyden in Holland, under whose ministry and through whose counsel the Pilgrim Fathers developed religious liberalism and executed the earliest planting of New England.

NEW FOREST, England, a public pleasure ground covering most of the southwest of Hampshire. It measures 14 by 16 miles, and has an area of 144 square miles. Its name dates from 1079, when William the Conqueror made a "mickle deer-frith," in so doing destroying several hamlets. This afforestation, enforced by the savage "Forest Laws," was regarded as an act of the greatest cruelty, and the violent deaths in the forest of his sons Richard and William Rufus were looked upon as special judgments. Oak and beech are the principal trees; the deer were removed in 1851. The forest is under the supervision of the Court of Verderers since 1877; it gives its name to a county parliamentary division. There are several villages within its limits, Lyndhurst being the forest 'capital'. Consult Cornish, C. J., 'The New Forest' (1905).

NEW FRANCE, Company of, or of the Hundred Associates. Founded by Cardinal Richelieu in 1627 for the colonization of Canada and the conversion of the Indians to the Christian faith. The company was granted

feudal powers over the fort and town of Quebec, and the whole of New France, extending, according to the charter, from Florida to the Arctic Circle, and from Newfoundland on the east to the great freshwater sea on the west; and was also given a monopoly of trade. Huguenots were to be rigidly excluded. Neither as a colonizing nor as a religious enterprise did the company fulfil its obligations, the exploitation of the fur trade being its main concern. In 1645 it transferred its trading monopoly to a local corporation, the Compagnie des Habitans, and in 1663 its charter was withdrawn and the Crown resumed control over the colony.

NEW FRANCE, or **LA NOUVELLE FRANCE**, lä noo-věll fräns, the original name given to Canada (q.v.) by the earliest settlers, who were Frenchmen.

NEW GLASGOW, gläs'gō or -kō, Canada, town of Pictou County, Nova Scotia, on the East River, near its entrance into Pictou Harbor, and on the Intercolonial Railway, 104 miles northeast of Halifax, eight miles south of Pictou, on the Northumberland Strait. In the vicinity are rich deposits of coal and iron, which contribute to make it an important centre for the manufacture of iron and steel, and it is the headquarters of the Nova Scotia Steel and Coal Company, which has 6,000 persons on its payrolls. It has shipbuilding yards, foundries, machine shops, tanneries, glass and pottery works, and a considerable trade in coal, iron ore and manufactured articles. Pop. 9,000.

NEW GRANADA, gra-nä'da, the name by which the republic now called Colombia (q.v.) was known for many years after its settlement by people from Granada, Spain.

NEW GUINEA, gin'ī, or **PAPUA**, pāp'-oo-ā or pā'poo-ā, Australasia, a large island of the Melanesian region, the western and larger portion of which belongs to the Netherlands, while the eastern portion is divided into northern and southern sections, of which the former belonged to Germany until the European War, when it was placed under the administration of Australia by the Peace Treaty of 7 May 1919. The southern section belongs to Great Britain. The island, which after Australia and Greenland ranks third among the largest islands of the world, lies on the southwestern side of the Pacific Ocean, between lat. 0° 19' and 10° 42' S. and long. 130° 57' and 150° 52' E. Its length is about 1,490 miles; maximum breadth, 410 miles; estimated area, over 234,768 square miles. It is separated from Australia (Queensland) on the south by Torres Strait, from the northern territory of South Australia by the Arafura Sea, and from the Moluccas on the west by Gilolo Passage. The island has a somewhat irregular form, but it may be described as consisting of a broad central portion from which proceed two narrower peninsulas, one in the northwest and the other in the southeast. The coasts are mostly lofty, but in the neighborhood of Torres Strait and to the west the shore presents the appearance of a marshy flat, covered with dense forests. The outline is broken by many indentations, among the chief being the Gulf of Papua and M'Cluer Inlet on the southern side, and Great Geelvink Bay, Astrolabe

Bay and Huon Gulf on the northern side. Many islands, large and small, lie off the coast, chief of which are those of the Bismarck Archipelago formerly belonging to Germany off Kaiser Wilhelm Land, the northeastern section of New Guinea.

In the southeast of the island the mountain ranges rise in Mount Albert to 13,250 feet, and in Mount Victoria to 13,121 feet; and in Dutch New Guinea there are still loftier mountains, Mount Wilhelmina (15,830 feet) and Mount Carstensz (15,694 feet). The chief rivers are the Fly, in British territory, with its tributary, the Strickland; the Kaiserin Augusta, in the former German territory; and the Amberno, in Dutch territory, with a large delta. New Guinea has few indigenous mammals, and all these, with the exception of a species of pig and some mice, are marsupials and monotremes. It abounds in birds, among which are immense flocks of parrots, pigeons and kingfishers, and the celebrated birds of paradise. There are also several remarkable species of bower-birds, belonging to the genus *Amblyornis*. The forests abound in enormous trees, including the camphor-tree; and bananas, coconuts, sago, sugarcanes, rice, maize and yams are cultivated by the natives. On the west coast there are numerous Malay settlements, but the bulk of the inhabitants is composed of Papuans, a race resembling the negroes of Guinea. They are divided into numerous tribes chiefly in a neolithic stage of civilization, some of whom are of a friendly disposition, while others are fierce and untractable, cannibals and head hunters, but gradually improving under Europeanizing and missionary influence.

The discovery of New Guinea is said to have been made by Abreu in 1511, but the first navigator who is known to have visited the island was another Portuguese, Jorge de Meneses, who touched on it in 1526. The present name was given to the island by the Spaniard Ynigo Ortiz de Retes, who sailed along its north coast in 1546. From the beginning of the 17th century much exploring work was done by the Dutch, especially along the west and south coasts of what is now Dutch New Guinea. Dampier in 1700 added to our knowledge of the south coast, and discovered Dampier Strait. In 1827 the Dutch formed a settlement at Triton Bay, but they soon abandoned it. The southeast coast was surveyed between 1845 and 1850 by Capt. Owen Stanley, and 1873 Captain Moresby ascertained the exact form of the southeastern extremity. The naturalists were the first to make incursions into its interior, and among these Dr. A. R. Wallace, who visited it in 1858, was the pioneer. The missionaries came next, and mission stations formed by Germans are maintained on the northeast coast and by the London Missionary Society at various points on the southeast coast. Germany and the Australian colonies also began to take an interest in New Guinea, and the latter urged the British government to annex the east part of the island, the west portion having long been recognized as Dutch. The delimitation and division of the island between Great Britain, Germany and Holland was settled in 1885. That part of the island lying west of the 141st meridian was assigned to Holland, and comprises 151,789 square miles; the north part of the rest of the island was assigned to Germany, and the south to Great

Britain. The German territory, called Kaiser Wilhelm's Land, contains about 70,000 square miles; the English territory, 90,540 square miles. The German territory was occupied by Australian troops in October 1914.

The government of the British portion, known as the territory of Papua, is in the hands of an administrator, appointed by the Crown, assisted by an executive and a legislative council, and has since 1905 been under the government of the Australian Commonwealth. Land cannot be purchased except from the administrator. The deportation of the natives is forbidden, as is also the sale to them of firearms, intoxicating spirits or opium. The official centre is Port Moresby. The islands of Torres Strait, which are the seat of a valuable pearl-shell and trepang fishery, and which practically command the strait, have all been annexed to Queensland. A German chartered company whose object is to develop the resources of the country has stations in German New Guinea, where also the sale of firearms, gunpowder and spirits is forbidden. The Dutch have done little or nothing for their portion of the island. The population of the Dutch portion is estimated at 200,000; of the German, 530,000; of the British, 280,000. Consult Bevan, 'Toil, Travel and Discovery in British New Guinea' (1890); Chalmers, 'Pioneer Life and Work in New Guinea' (1895); Krieger, 'New Guinea' (1899); MacGregor, 'British New Guinea' (1897); Murray, 'Papua, or British New Guinea' (1912); Newton, 'In Far New Guinea' (1914); Webster, 'Through New Guinea' (1889); Seligmann, 'The Melanesians of British New Guinea' (1910); Williamson, 'The Ways of the South Sea Savage' (1914).

NEW HAMPSHIRE, one of the original States of the Union, located in the northeastern or New England division of the United States of America. Its name first was applied to a part of its territory in a grant from the Plymouth Company to Capt. John Mason of Hampshire, England, in 1629. From its abundant granite it is locally and popularly called the "Granite State."

Boundaries and Area.—New Hampshire lies between 70° 37' and 72° 37' W. from Greenwich and between 42° 40' and 45° 18' N. lat. Its general outline is that of a scalene, almost a right-angled triangle, the right angle being at the southeast corner, with an east and west base—the southern boundary—of approximately 95 miles, a north and south perpendicular of 180 miles to its acute angle and a hypotenuse of 190 miles. The State is bounded on the north by the province of Quebec, on the east by the State of Maine, on the southeast by the Atlantic Ocean and Essex County, Mass., on the south by the State of Massachusetts and on the west by the State of Vermont, the divisional line being the west bank of the Connecticut River, and by the province of Quebec. The area of the State is 9,341 square miles, of which 9,031 square miles are land surface and 310 square miles are water.

Physiography.—The surface of the State is in general rugged and picturesque. It presents in close proximity the diversified features of high, rocky and steep mountains, long ranges of hills, large forests, fertile valleys,

numerous lakes and rivers, with a strip of sea-coast 18 miles in length. Topographically the State is divided by a mountainous ridge six or seven miles east of the Connecticut River and nearly parallel to its course whose crest separates the Connecticut and the Merrimac River basins, and by the White Mountains into four nearly equal parts, each of which has distinctive features. The southeastern division which is the largest lies south of the White Mountains and east of the crest of the mountainous ridge between the Connecticut and Merrimac River basins. It also is the lowest of these divisions, three-fourths of its area away from the foothills on its northern and western borders scarcely exceeding 500 feet above sea-level. Though it has many hills and much of its soil is sandy, it has a considerable tract of fertile land and is underlaid by gneissic or granitic rocks. Within its borders are nine of the 11 cities of the State and the largest number of its manufacturing centres. The southwestern division lies south of the White Mountains and west of the crest of the mountainous ridge which separates the Connecticut and Merrimac River basins. The width of this division varies from five miles near Orford on the north to 30 miles near New Ipswich on the south, and is traversed by numerous ranges of hills and fertile valleys. Near the divisional line between the Connecticut and Merrimac River basins are three isolated peaks of hard rock called monadnocks, which geologically resemble those in the White Mountain division, two of them northwest of the central part of the State and the other near its southern border, Cardigan, 3,100 feet; Kearsarge, 3,310 feet, and Monadnock, 3,186 feet above sea-level. The north-central division is entirely covered by the ranges and valleys of the White, Franconia and Sandwich Mountains, which together form one system of mountains. This division which contains very little cultivable soil extends from the Connecticut River to the Maine boundary and from Squam Lake on the south approximately 33 miles to the transverse valleys of the Androscoggin and Upper Ammonoosuc and Johns rivers on the north. It has an area of 1,270 square miles and presents the most unique physical features of the State in the White Mountains which contain the culminating elevation of the northeastern spur of the Appalachian or Atlantic Coast system of mountains. Mount Washington, 6,293 feet, the highest of the White Mountains, is the loftiest peak in the United States northeast of the Potomac River. The heights of the other neighboring mountains are Mount Adams, 5,805 feet; Jefferson, 5,725 feet; Clay, 5,554 feet; Monroe, 5,390 feet; Madison, 5,380 feet; Lafayette, 5,269 feet; Moosilauke, 4,810 feet. Geologically these mountains belong to the older or crystalline belt of the Appalachian system and have the form of a group of monadnocks or isolated remnants of hard rock, gneiss or granite, which have withstood through a long geological period the erosion which has worn down the schists and other foliated strata which originally surrounded them into bordering hills and the southeastern peneplain. The diversified and beautiful scenery of this region annually attracts tourists from all parts of the country and has given it the name of the "Switzerland

of America." The northern division lies north of the White Mountain district or the transverse valleys of the Androscoggin and Upper Ammonoosuc and Johns River valleys and is nearly coterminous with the northern county (Coos) of the State. Its surface is broken by undulating ridges and numerous rugged mountains whose altitude exceeds 2,000 feet above sea-level. A large part of it is covered with forests, but it contains along its valleys many tracts of great fertility.

River Systems.—There are five distinct water-shed areas drained by the Connecticut, Merrimac, Androscoggin, Saco and Piscataqua rivers and their numerous tributaries. These streams contribute materially to the economic resources of the State through their abundant water power and to the fertility of their valleys.

Lakes.—The lakes of this State are numerous. The largest, Winnepesaukee, situated in Belknap and Carroll counties, has an area of 71.75 square miles, exclusive of islands, of which it has 264. Other important lakes in order of size are Umbagog, 15.80 square miles; Squam, 11.75 square miles, and Sunapee, 9.22 square miles.

Climate.—By reason of latitude, ocean proximity, high mountains and narrow valleys the climatic conditions of the State present great variety. In general the climate is rigorous, the snow covering the ground for four or sometimes five months of the year. The mean average temperature of the northern portion for the year is 41°; for the winter, 17°; for the summer, 65°; of the southern part the mean average for the year is 45°; for the winter 23°; for the summer, 66.5°.

Precipitation.—The average precipitation is nearly 40 inches per year, quite evenly distributed both as to area and period.

Soil.—The mountainous portions of the State are exceedingly rocky and have a thin gravelly soil. The less elevated regions are generally well watered and fertile, affording much excellent land for grazing and tillage. The productiveness of the soil is well above the average yield of the United States.

Population.—The original white settlers in different parts of New Hampshire between 1623 and 1776 with few exceptions were English folk who came directly from England or from the neighboring colonies of Massachusetts and Connecticut or Scotch-Irish folk from the north of Ireland. The total population probably did not exceed, in 1641, 1,000, and in 1771 70,000. According to the first census of the United States in 1790 the population of the State was 141,885. The most rapid increase of the population was during the next six decades. During the 60 years from 1790 to 1850 the absolute increase in population was 176,091 or 124.1 per cent, while during the 60 years since 1850 the increase was 112,596 or 35.4 per cent. In the last of these decades, 1900–1910, the increase of population was 18,984 or 4.6 per cent. By the 14th census in 1920 the population was 443,083, the average number of persons to the square mile being 48.9 per cent, making the State rank 19th among the States of the Union in the density of its population. The urban population in 1910 including that of all incorporated places of 2,500 inhabitants or more was 255,099

or 59.2 per cent. By 1920 the urban population had increased to 279,761, or 60.88 per cent.

Of the total population of New Hampshire in 1910, 230,231, or 53.5 per cent, were native whites of native parentage; 103,117, or 23.9 per cent, were native whites of foreign or mixed parentage; 96,558, or 22.4 per cent, were foreign-born whites; and 564, or 0.1 per cent, were negroes. Of the population in 1920, 225,512, or 50.9 per cent, were native whites of native parentage; 125,586, or 28.4 per cent, were native whites of foreign or mixed parentage; 91,233 or 20.6 per cent, were foreign-born whites, and 621 or 0.1 per cent, were negroes. Of the foreign-born population French Canadians numbered 38,277; other Canadians, 13,997; Irish, 7,908; Poles, 3,997; Russians, 3,467; Greeks, 5,280; English, 4,367; Italians, 2,074.

There are 14 cities in New Hampshire whose aggregate population in 1920 was over 236,000, or over 50 per cent of the total population. The population of each of these cities was as follows: Berlin, 16,014; Clermont, 9,524; Concord, 22,167; Derry, 5,382; Dover, 13,029; Franklin, 6,318; Keene, 11,210; Laconia, 10,897; Manchester, 78,384; Nashua, 28,379; Portsmouth, 13,569; Rochester, 9,673; Somersworth 6,588.

Agriculture.—The leading industry of New Hampshire from the time of its first settlement to the last quarter of the 19th century was agriculture, and although it now occupies a second place it is still of great importance. The soil along the seacoast and in the river valleys is fertile, while the upland farms require careful treatment to render them fairly productive. According to the census of 1910, 56.2 per cent or nearly three-fifths of the entire area was devoted to agriculture and only the northern county, which contains nearly all the White Mountain division of the State, had less than two-fifths of its land area in farms. The number of farms has fluctuated slightly from decade to decade since 1860 and in 1910 was 27,053 or 2,271 less than in 1900. These farms contained 3,249,458 acres, of which 929,185 were improved land and 2,320,273 were unimproved. Between 1900 and 1910 the acreage of improved land decreased 147,694 acres or 13.7 per cent. This significant fact denotes a readjustment of methods to meet the competition of the West. Cereals and crops requiring large areas have given place to the more intensive forms of agriculture, such as dairying, fruit-growing, poultry-raising, and in the southeastern part of the State to market gardening.

In 1910 the value of all farm property, including land, buildings, implements, machinery, domestic animals, poultry and bees was \$103,704,196, an increase since 1900 of \$17,862,100 or 20.8 per cent; the value of the land in these farms was \$44,519,047, an increase since 1900 of \$9,020,287 or 25.4 per cent. In 1910 the average size of the farms in the State was 120.1 acres, approximately one-sixth of them being from 20 to 49 acres, nearly one-half between 50 and 174 acres, while those which exceeded 500 acres had increased between 1900 and 1910 by only six or less than 1 per cent. In 1910, of the total number of farms 25,174 or 93.1 per cent were cultivated by owners and managers, and 1,879 or 6.9 per cent by tenants; 6,234 or 25.6 per cent were mortgaged.

By 1920 the number of farms in the State had dropped to 20,523, or 6,530 less than in 1910. Land in farms dropped correspondingly from

3,249,458 acres in 1910 to 2,603,806 acres in 1920. The improved acreage in 1920 was 702,902, a decrease in 10 years of 226,283 acres. The percentage of land area in farms in 1920 was 45.0, as compared with 56.2 in 1910. However, the value of all farm property increased to \$118,656,115 in 1920. The value of land alone was \$47,425,331; of implements and machinery, \$9,499,322, and of livestock, \$19,160,923. The average acreage per farm was 126.9 and the average value per acre (land alone) \$18.21. Owners operated 18,604 of the farms; managers, 546, and tenants, 1,373. Mortgaged farms numbered 5,389, and the mortgage debt was \$6,820,551. Production in 1922 in bushels was as follows: Corn, 1,032,000; barley, 28,000; oats, 684,000; buckwheat, 25,000; potatoes, 1,400,000; apples, 775,000; hay (tame) 585,000 tons. Animals on the farms 1 Jan. 1923 were: Horses, 35,000; milch cows, 126,000; other cattle, 34,000; sheep, 18,000; swine 28,000.

Manufactures.—Throughout the colonial period these were limited to the common household industries, gristmills, sawmills and a few iron forges. During the first half of the 19th century the textile and several other important industries were begun, and utilizing the abundant water power of the State, grew so rapidly that before the close of that century manufactures took the first place among the industries.

According to the census of manufactures of the United States there were in New Hampshire, in 1914, 1,736 manufacturing establishments with a total capital of \$156,748,853 whose product was valued at \$182,843,863, the value added by the processes of manufacture, the best measure of the importance of the industry, being estimated at \$67,850,428, and paying \$40,642,393 to an average number of 78,993 wage-earners, of whom 70.4 per cent were males over 16 years of age, 29 per cent were females over 16 years of age and 0.6 per cent were under 16 years of age. In 1914 and 1909 the State ranked 29th and 28th, respectively, in value of products; 20th in average number of wage-earners and 28th and 27th, respectively, in value added by manufacture. The relative importance of the four largest of these industries arranged according to the value of their products in 1914 was as follows: The three most important branches of the textile industry—cotton goods, including cotton small wares, woolen and worsted goods, and hosiery and knit goods—ranked first with a product valued at \$55,115,067 or 30.1 per cent of the total value of manufactured products for the State and gave employment to 34,529 or 43.7 per cent of the total average number of wage-earners. The boot and shoe industry ranked second, with a product valued at \$46,694,765 and showed an increase of 18.4 per cent in value of products during the five-year period 1909-14. The paper and wood-pulp industry ranked third with a product valued at \$17,708,138. The substantial growth of this industry since 1899, is explained by the forests of pulp wood, large water power and increased demand for print paper. Lumber and timber products rank fourth with a product of \$16,554,468. In 1919 the number of manufacturing establishments in the State was 1,499, capitalized at \$329,166,870, which turned out products valued at \$407,204,934, of which sum \$167,677,317 represented the value added by man-

ufacture. Wage earners employed numbered 83,074 and wages paid totaled \$79,326,341. Materials used cost \$239,527,617, and the primary power employed totaled 349,138 horsepower. The State ranked 29th in value of products, 27th in value added by manufacture and 25th in the number of wage earners employed. Again from the standpoint of relative importance, the textile industry, including cotton goods, woollens and worsteds, ranked first, the product being valued at \$131,930,000. Boots and shoes continued to be the second industry with an output valued at \$73,871,000. Paper and wood pulp was third, the product being valued at \$41,826,000. Boot and shoe cut stock and findings took fourth place with a product valued at \$22,389,000. Lumber and timber products were fifth, their value being placed at \$14,992,000. This is one of the oldest and most important manufacturing industries and has by far the largest number of establishments of any industry in the State. The decrease in value of its product from 1914 to 1919, probably was due to the fact that much of the lumber formerly used in the industry is now being made into pulp to supply the growing demand of the paper industry. Among other important industries are foundry and machine-shop products; leather, tanned, curried and finished; flour-mill and grist-mill products; tobacco and cigars; marble and stone work; textile machinery and parts; bread and other bakery products; wooden packing boxes and furniture. An Employers' Liability and Workmen's Compensation Act, 1911, provides for the protection of wage-workers engaged in manual or mechanical labor in employments classified as dangerous and ensures them or their heirs compensation for injuries occasioned by illegal acts, omissions or negligence of their employers or fellow-workmen resulting in death or disability. A bureau of labor, established in 1893, was reorganized in 1911, and a commissioner of labor, its executive officer, is charged with the duty of enforcing all laws relating to labor in mechanical and mercantile establishments.

The hours of labor of females and minors under 18 years of age employed at manual or mechanical labor, except in specified in domestic, nursing, telephone and telegraph or farming occupations, are limited by an act of 1917 to 10¼ hours during any one day and to 54 hours in any one week, or if employed on night work to eight hours in any 24 or not more than 48 hours in any one week.

Mining and Quarrying.—Gold, silver, lead, zinc and iron are found, but none of them in sufficient quantity to make their working profitable. The total value of all mines and quarries in New Hampshire in 1909 amounted to \$1,308,597. Of this amount granite quarrying, the principal industry, reported products valued at \$1,205,811, which represented 92.1 per cent of the total. The estimated value of all the products of mines and quarries in 1919 was \$1,568,195, of which amount the principal quarrying industry, granite, reported products valued at \$1,427,979, or 91.1 per cent of the total and gave employment to 589 wage earners. The granite is used mainly for building and curbing and for monumental work. The principal quarries in the order of their importance are located in Hillsboro, Merrimac, Cheshire and Carroll counties. Other industries of this

group of minor importance are copper, mica and scythe-stones.

Forest Reservation and Public Parks.—In 1893 the State after extended investigation into its natural resources by temporary commissions established a permanent forestry commission to promote the conservation of those resources, to inquire into the effects of different methods of lumbering upon the timber supply, water power, climate and scenery, the damages due to forest fires and to establish wherever possible without expense to the State public parks. This commission, which from time to time has been granted additional powers, was reconstituted in 1911 and now consists of three persons appointed by the governor and council for a term of three years. Through the agency of this commission which appoints a State forester, New Hampshire within the last 25 years has secured the general adoption by its large lumber operators of scientific methods of forestry, adequate protection against the waste of forest fires and by the establishment of public parks and forest reservations, particularly at the sources of its rivers, the permanent conservation of its water power and its more equitable distribution. To this last and most important result private persons, municipalities and voluntary associations, such as the Society for the Protection of New Hampshire Forests and the Appalachian Mountain Club, have contributed numerous public parks and smaller reservations. The large State reservation is located in the heart of the White Mountains and to the northeast of the famous Crawford Notch. The White Mountain National Forest Reservation established pursuant to the Weeks Act of Congress, 1 March 1911, for protecting the headwaters of navigable streams of the United States, already includes large tracts in both the White Mountain and northern sections of the State, and by the provisions of that act is receiving frequent additions. The acreage included in these different forest reservations and public parks at the end of 1916 was as follows:

State forests and reservations.....	9,800 acres
Forests owned by towns and cities.....	5,329 "
Municipal parks and forests.....	420 "
Appalachian Mountain Club reservations.....	721 "
Society for Protection of New Hampshire forests (Reservations in New Hampshire)...	2,269 "
Conway Commons (partial State and town ownership).....	4,000 "
Acreage of Reservations in New Hampshire outside of National Forest.....	22,539 "
White Mountain National Forest.....	365,000 "
Total acreage of reservations and parks in New Hampshire.....	387,539 "

The addition of these large tracts to the public domain and their virtual dedication to the public use not only ensures a large conservation of the natural resources but also increases the State's attractions for tourists which long ago made it a summer play-ground and has given it the name of the "Switzerland of America."

Transportation.—The State has a good system of communications by highways and railways. The greatest mileage of both is in the central and southern or most populous parts and all their main lines except those in the Connecticut Valley converge upon the commercial centre of New England—Boston. In 1918 the total mileage of the highways of the State was 14,020 miles and of its railroad lines

1,221 miles. Until the beginning of the present century the highways of the State, except a few trunk-line toll turnpikes built and operated by private companies before the introduction of railroads, were built by the towns through which they ran and supported by taxation of their inhabitants. In 1905 the State began the systematic improvement of its main highways, with the co-operation and at the joint expense of the State and of its municipalities, and appointed a State engineer of highways now known as commissioner of highways. As a result of this policy and the repeatedly enlarged appropriations which during the interval have been made to give it effect, the State, in April 1918, had six trunk-line highways, three of them running from the Massachusetts State line northward; the *Merrimac Valley Road*, from Nashua to the line between Woodstock and Lincoln in the White Mountains; the *West Side Road*, from Winchester on the Connecticut to Colebrook on the same river; the *East Side Road*, from Seabrook through Pinkham and Dixville Notches in the White Mountains to Colebrook. Three of these trunk lines run east and west across the State; the *South Side Road* from Walpole on the Connecticut River to Portsmouth on the *East Side Road*; the *Rockingham Road* from Manchester on the Merrimac Valley Road to Salem on the Massachusetts State line; and the *Ossipee-Meredith Road* from the Merrimac Valley Road at Meredith to the East Side Road near the village of West Ossipee. These six trunk lines have a total mileage of 630 miles and are practically completed, and they for the most part follow the pre-existing town highways. The legislature in 1915 authorized the designation for future improvement of 10 additional east and west or cross-State highways. These as established have a total mileage of 451 miles, of which 150 miles already have been built. The legislature of 1917 authorized the designation of six more cross-State highways for improvement. The expense of this reconstruction, extension and improvement of the highways of the State since 1905 has been met by taxation and the issue of State highway bonds. The State makes an annual appropriation of \$125,000 for the Department of State Highways, and from 1914 to 1916 inclusive it also appropriated \$150,000 per year for trunk line construction, a total appropriation for trunk line and State-aid construction of \$275,000. The legislature of 1917 assented to the provisions of the Federal Aid Act for the construction of rural post roads passed by the 64th Congress, and has undertaken to expend for such purpose each year a sum equal to the amount of such Federal aid as it shall receive.

The first railroad in the State to begin operation was the Nashua and Lowell Railroad which was chartered in 1835. Between 1840 when the total railroad mileage of the State was only 22½ miles and 1883 the State granted numerous charters to railroad companies under which many short lines were constructed and with little public aid, State or municipal. In 1883 when the railroad mileage had increased to 1,041 miles, the State, reversing its earlier policy which assumed that competition between its railroads was essential for the public welfare, authorized the incorporation of railroads under the general law, and also their combina-

tion and consolidation within specified limits and subject to stringent regulation. As a result of this legislation, which was supplemented in 1889 by an act limiting the rates to be charged by all consolidating railroads to those in force in August 1883, the decade between 1880 and 1890 was marked by the combination and consolidation of the railroads within the State which left two of them, the Boston and Maine in the southeastern part and the Concord and Montreal in the central and northern part, practically dividing between them its entire railroad mileage. These two railroads thus in 1890 controlled 958 miles in the State, other railroads having control of only 168 miles. During the decade—1890–1900—the Boston and Maine Railroad Company secured a practical monopoly of the railroad mileage of the State, by acquiring control over the Maine Central system by stock ownership in 1891, by leasing the Concord and Montreal Railroad in 1895, and the Fitchburg Railroad in 1900. In 1907 the New York, New Haven and Hartford Company secured temporary control over the Boston and Maine Railroad system, but, as the result of a suit begun by the United States to enforce the Sherman Anti-Trust Law, was compelled to relinquish it in 1914. In 1916 the Boston and Maine Railroad Company was, upon petition to the United States Circuit Court, declared bankrupt and was being administered by a receiver when its control and administration was assumed by the United States, pursuant to its war policy, on 28 Dec. 1917. The total railroad mileage of the State in 1917 was 1,221 miles distributed as follows: Boston and Maine Railroad, 1,020; Maine Central Railroad, 100; The Atlantic and Pacific (Grand Trunk), 52.

Railroad and Public Service Commissions.

—In 1911 the State substituted for its Railroad Commission, which was established in 1844, a Public Service Commission, which consists of three members appointed by the governor and council for a term of six years. This commission has large supervisory and regulative powers, not only over railroads, but other public utilities, and is given adequate authority to enforce its orders to secure safe and adequate services and facilities and just and reasonable rates.

Government.—The constitution of the State which took effect on 2 June 1784 still is in force except so far as it has been modified by subsequent amendments. The only mode it prescribes for making amendments is through a constitutional convention, the qualified voters being called upon every seven years to vote upon the necessity of summoning a convention to revise the constitution. If summoned the delegates to it are chosen in the same manner and upon the same basis of representation of town, cities and wards and unincorporated places as are the members of the lower branch of the legislature. No proposal of such a convention for the alteration of the constitution becomes a part thereof until it shall have been approved by two-thirds of the qualified voters present and voting on the subject. Constitutional conventions have been held in 1791, 1850, 1876, 1889, 1902 and 1912, which have proposed numerous amendments to the organic law of the State, but those which have been adopted have wrought comparatively small change in

the general structure of the government or the agencies by which it is administered.

Legislature.—By this constitution legislative power is vested in a senate and house of representatives which together are styled the General Court, and assembles biennially on the first Wednesday of January in the odd years. The senate is composed of 24 members representing districts "as nearly equal as may be" and "by the proportion of direct taxes paid by the said districts." The house of representatives is composed of members apportioned according to the population in towns, cities, wards, and unincorporated places, one for a minimum population of 600 and one for each additional 1,200. Towns of less than 600 are entitled to one representative for such proportional part of the time as their population bears to 600. The retention of the town as the political unit for representation and the increase of population and subdivision of towns since 1784 have united to give New Hampshire the largest house of representatives of any State in the Union. That body consists of from 419 to 422 members. The members of both houses of the legislature are elected biennially in the even years in the month of November.

Executive.—The executive power is vested in a governor who is elected biennially on the same day as members of the legislature and whose term of office begins on the first Wednesday of the following January. Originally if no person received a majority of votes cast for governor the senate and house of representatives by joint ballot elected one of the two persons having the highest number of votes for that office. In 1913 the constitution was so amended that the governor may be elected by a plurality of votes. An Executive Council consisting of five persons, one from each of five districts into which the State is divided, is elected biennially on the same day as the governor by ballot to advise the governor and it shares with him the power of appointing all judges, the attorney-general, coroners and all officers of the navy and the militia, the governor and council having a negative on each other both in making nominations and appointments. They also share the power of pardoning offenses except cases of impeachment, the power of drawing money from the treasury, except for specified purposes, for the necessary support and defense of the State and the protection of its inhabitants, and the power of removing judges upon the address of both houses of the legislature. Other executive officers, a secretary of state, a treasurer, a commissary-general and a State printer are elected biennially by ballot of the two houses of the legislature in joint session. In case of a vacancy in the office of governor, the president of the senate and the speaker of the house of representatives in succession exercise the powers and duties of that officer.

Judiciary.—The courts of the State are a Supreme Court, consisting of a chief justice and four associates, having jurisdiction over issues of law; a Superior Court, consisting of a chief justice and four associates, having jurisdiction for the trial of issues of fact, the judges of this court attending the trial terms in a circuit of the shire towns which includes the entire State; 10 Courts of Probate, organized with a judge and register for each county;

municipal courts (one in each city and town having not less than 2,000 inhabitants), having limited and preliminary criminal jurisdiction and jurisdiction of civil causes in which not more than \$100 is claimed and the title of real estate is not in issue; justices of the peace, having preliminary and limited criminal jurisdiction in towns and places where no municipal court is established and jurisdiction in civil causes to the amount of \$13.33, provided the title to real estate is not involved. The public service commission, the tax commission and county commissioners also have preliminary and limited judicial functions. Admission to the bar requires three years of actual and certified study, followed by examination, both oral and written, before a standing board of examiners appointed by the Supreme Court. Certificates of graduation from law schools are not accepted in lieu of actual qualification, ascertained in the manner above stated. The Federal Circuit and District Courts are held at Concord, where the office of their clerk is located, at Portsmouth and at Littleton.

County Government.—For administrative and judicial purposes the State is divided into 10 counties with county-seats and population as follows:

COUNTIES	Pop. 1920	COUNTY SEAT	Pop. 1920
Belknap.....	21,178	Laconia.....	10,897
Carroll.....	15,017	Ossipee.....	1,122
Cheshire.....	30,975	Keene.....	11,210
Coos.....	36,093	Colebrook.....	1,811
		Lancaster.....	2,819
		Haverill.....	3,406
Grafton.....	40,572	Plymouth.....	2,353
		Lebanon.....	6,162
		Manchester.....	78,384
Hillsborough.....	135,512	Nashua.....	28,379
		Concord.....	22,167
Merrimac.....	51,770	Exeter.....	4,604
Rockingham.....	52,498	Portsmouth.....	13,569
Strafford.....	38,546	Dover.....	13,029
Sullivan.....	20,922	Newport.....	4,109

A board of three commissioners elected biennially by popular vote are the executive officers of each county. These officials also have certain judicial functions relative to the laying of highways, the settlement of paupers and issues of fact referred to them for trial by the Superior Court. The members of the legislature for each county, assembled in convention, are a legislative body for the county. Upon recommendation of the county commissioners they vote taxes for county purposes and direct their expenditure. Other county officers are judges of probate and medical referees (coroners), who are appointed by the governor and council, and registers of probate, solicitors, registrars of deeds, treasurers and sheriffs who are elected biennially by popular vote.

Municipal Government.—Each of the 11 cities of the State now is governed under charters of the ordinary American form by a mayor and subordinate administrative officers and a common council.

Town Government.—The State is divided into minor civil divisions, towns and 23 unincorporated places. The towns, which, as in the other New England States, are the territorial and political units or cells from whose multiplication and union the body politic was developed, now number 224. They are the smallest administrative units of the State and have

NEW HAMPSHIRE

2 Bethlehem, White Mountains

large powers for local government, including those of general police, building and maintenance of highways, inquiry into need of poor relief, which is administered by the county, and the support of public schools. These towns retain their original form of pure democracies and are governed through a town meeting held annually in the month of March which elects town officers and votes all taxes for town purposes. These officers are three selectmen, who have general management for the year of town affairs and who also act as assessors, a treasurer, town clerk, constable, school trustees and some minor officers.

Suffrage and Elections.—The constitution now provides that every inhabitant who has reached the age of 21 years and who has resided in one town six months is entitled to vote, provided he or she is able to read the constitution in the English language and to write. An amendment to the constitution adopted in 1913 provided for the disfranchisement of all persons who shall have been convicted of treason, bribery or any wilful violation of the election laws. Voting at all elections is by ballot and is limited to duly qualified electors whose names are inscribed upon a certified check list. The total number of persons 21 year of age and over in 1920 was 281,026, representing 63.2 per cent of the population. Of such persons, 146,345 were native whites of native parentage; 52,136 were native whites of foreign or mixed parentage, 82,049 were foreign-born whites and 388 were negroes. Of the foreign-born whites of voting age, 36,621 were naturalized and 6,260 had taken out first papers.

Caucuses, Primaries and Conventions.—The State recognizes political parties and regulates them by general laws which include (1) a law prescribing the mode of holding caucuses and conventions in the larger cities and towns to nominate candidates to be voted for at city, town and school district elections, and (2) a Direct Primary Law which provides a uniform mode of making nominations of candidates for all town or city, county, State and national officers to be voted for at the biennial election held in the month of November in the even years, except presidential electors; prescribes the enrolment of party members by the regular supervisors of the check list; the conduct of the primary by the regular town or city election officers, and a State party convention for each party, to be held shortly before each biennial election, to adopt a party platform, nominate presidential electors and effect an organization for the following two years; and (3) a law prohibiting corporations to contribute to political parties, committees or individuals for any political purpose; and (4) a corrupt and illegal practices act which prohibits the payment, gift or promise of anything of value by any political committee or candidate to promote or defeat the election of any party or person, except for specified purposes, and which fixes the maximum expenditure allowable for each of them; and (5) a law requiring publicity of campaign receipts and expenditures by all political committees and all candidates for national offices and important State offices, with an itemized statement of their campaign expenditures. A Presidential Primary Law was enacted in 1913, which prescribes the mode of holding primaries for electing delegates to

the national conventions of political parties in each year thereafter when a President and a Vice-President of the United States are to be elected.

National Guard.—By the census of 1910 the total number of males of militia age, 18 to 45 inclusive, in New Hampshire was 90,357. The National Guard on 31 Aug. 1916 was composed of one regiment of infantry of 12 companies, a coast artillery corps of four companies, a troop of cavalry, a battery of field artillery and a signal corps, a field hospital corps or detachment, with a total force of 97 officers and 1,609 enlisted men. The legislature by an Act Concerning the Militia, approved 5 April 1917, recognized its whole military establishment to conform to the provisions of the National Defense Act passed by Congress 3 June 1916. By this concurrent legislation the State militia was divided into the unorganized militia, whose members were arranged according to age and marital conditions in four classes, with consequent liability to draft, and the National Guard, which while it received the aid and support of the United States under the National Defense Act was governed by the laws, rules and regulations of the United States in respect to the number of its enlisted men and officers, its organization, uniforming, equipping, training, discipline, the qualification, appointment, commissioning and promotion of its officers, and the period and qualifications for enlistment and discharge of its enlisted men. Officers and men in the National Guard when it was drafted on 25 July 1917 into the service of the United States was 2,766. On 31 May 1923 the National Guard had an authorized strength of 1,001 and an enlisted strength of 1,028 or 3 per cent above its quota.

Finance.—The report of the treasurer of the State for the fiscal year ending 31 Aug. 1917 showed a total of receipts and cash on hand of \$4,159,714.96; disbursements for the same year of \$4,017,324.13, leaving cash on hand of \$142,390.83. The net indebtedness of the State, 1 Sept. 1917, was \$1,431,002.73, an increase during the preceding fiscal year of \$362,048.71. The largest part of this increase was due to the general conditions caused by the European War.

At the beginning of the fiscal year 1921–22 the balance in the State treasury was \$789,041.32. Receipts during the fiscal year amounted to \$7,691,699.35; disbursements to \$6,793,157.72, leaving a balance at the beginning of the fiscal year 1922–23 of \$1,687,582.95. The bonded debt of the State at the beginning of 1923 was \$2,489,500. On the same date the floating debt was \$1,128,004.54, making the total debt \$3,617,504.54. The assessed value of the real property in the State in 1922 was \$456,584,737; of personal property, \$109,884,607.

Taxation.—The State always has raised the largest part of its revenue by taxation of specific kinds of property, real and personal. It also has made use, and increasingly during the last quarter of the century, of license and other excise taxes, including special taxes on corporations, and since 1905 has imposed a collateral inheritance tax. A tax commission known as a board of equalization was created in 1878, which, since its reorganization under its present name in 1911, consists of three members who are appointed by the Supreme

Court and commissioned by the governor for a term of six years. The duties of this commission include the formulation of inventories of all property subject to taxation, the assessment of railroad, telegraph, telephone, express and other specified corporate property, the general supervision over the administration of the assessment and taxation laws of the State and over all assessing officers, and every second year, beginning in 1912, the equalization of the valuation of the property in the several towns and cities in the State and in general the direction of the enforcement of all the tax laws of the State and the recommendation of any changes in them which in their judgment may be desirable.

Banks.—The first bank in the State was the New Hampshire Bank which was chartered 3 Jan. 1792 and located at Portsmouth. In 1820 the number of banks was five, in 1840, 28 and in 1860, 51. During the next decade all but three of these State banks took advantage of the provisions of the National Banking Act of 1862 and became national banks. The condition of all the reporting banks in New Hampshire, numbering 126, of which 56 were national banks, on 30 June 1922 as appears by the report of the Comptroller of the Currency for 1922, was as follows: total resources, \$231,388,000; loans and discounts, \$103,158,000, investments, \$111,826,000; a total capital, \$7,473,000; individual deposits, \$191,510,000; United States deposits, \$278,000; surplus, \$12,588,000; undivided profits, \$7,322,000.

Savings Banks.—The first savings bank in the State was the Portsmouth Savings Bank which was chartered 26 June 1823. In 1850 the number of such banks had increased to 12 when there were 13,000 open accounts averaging \$125 for each depositor. In 1893 their number was 70, and there were 174,000 open accounts averaging \$425 to each depositor. The total number of savings institutions in the State on 30 June 1917 was 67. According to the report of the State bank commission for 1917, the total amount of savings deposits in the savings banks, 56 in number, and the savings departments of trust companies, 11 in number, on that date was \$124,160,974.19.

On 30 June 1922, there were in the State 11 stock savings bank with deposits totaling \$14,030,000 and resources aggregating \$16,027,000; 45 mutual savings banks with deposits totaling \$123,380,000 and resources aggregating \$134,506,000 and 11 loan and trust companies with savings departments and saving deposits of \$12,164,000—total savings institutions, 67; total savings deposits \$149,574,000, an increase since 1917 of \$25,413,000. Savings depositors in stock savings banks in 1922 numbered 32,993 and the average due each was \$409.15. Depositors in mutual savings banks numbered 230,534 and the average due each was \$521.21.

Charities and Corrections.—The more important agencies of the State established for the dependent and delinquent classes are: (1) The State Hospital for the Insane at Concord for paying patients, and since 1 Jan. 1909, for the care and support of all its insane paupers; (2) the School for Feeble-Minded at Laconia; (3) the Industrial School at Manchester; (4) the Sanatorium for Consumptives, opened in 1909 at Glencliff in the town of Benton in the White Mountains; (5) the State prison at Concord.

The management of these five institutions since 1907 has been vested in a board of trustees, consisting of the governor ex officio, and four other persons appointed by the governor and council for a term of four years, their superintendents being appointed by this board. A board of charities and corrections, created by the legislature in 1895, provides for the suitable education, training and support of orphans or friendless or dependent or delinquent children, and since 1897 inspects all State and county charitable or correctional institutions, including county almshouses. The minor children whose guardianship is the chief duty of this board are placed by it in the New Hampshire Home for Orphans at Franklin or in some of the other 18 like homes in the State, or in private families, and since 1907 this board has been aided in the discharge of its duties by a Juvenile Court. A Soldiers' Home was established in 1890 at Tilton, for which the State makes an annual appropriation of \$15,000 and toward whose support the United States government pays \$100 a year for each soldier in residence. This home is open for all dependent soldiers honorably discharged, who have served in the army or navy of the United States in any of its wars.

Public Health.—A State board of health was established in 1881, which since 1889 also has served as a board of commissioners of lunacy and consists of the governor and attorney-general, ex officio, a civil engineer and three physicians. The active head of this board is its secretary, who is chosen by the board and is the registrar of vital statistics for the State. Its functions, enlarged from time to time, now include the investigation in a State laboratory of hygiene of the causes of disease, and a variety of field work throughout the State, such as the inspection of foods, dairies, grocery stores, slaughter-houses and the supervision of the administration and enforcement of health laws by local officials.

Education.—Public education in New Hampshire probably began in 1647, when the Massachusetts Bay Colony, which had assumed jurisdiction over the four settlements then existing in New Hampshire, ordained that every township should provide for its support. This law, re-enacted by the province of New Hampshire after its union with the Bay Colony was dissolved, continued in force with few changes until 1789, when the State, repealing all previous legislation on the subject, substituted for it a law which required the selectmen of each town to assess annually their inhabitants at a specified rate for the sole purpose of keeping an English grammar school or schools for teaching reading, writing and arithmetic, and required the appointment of duly qualified teachers. The present school system has been built upon the basis of this statute. In 1791 and at frequent intervals since then the State provided for increase of the rate of taxation for school purposes; in 1840 for the establishment of graded schools, in 1848 for the opening of high schools, the law now requiring all towns not maintaining such schools to pay the tuition, though with State aid, of their pupils qualified to enter them in high schools or academies in neighboring towns; in 1848 for the establishment of teachers' institutes; since 1868 for the establishment of the office of superintendent of public instruction whose incumbent has general visitorial, ex-

minating and supervising powers over all public schools; in 1870 for the establishment of a normal school at Plymouth and in 1909 of another such school at Keene, and by numerous other acts for the extension and improvement of public education. The present school law now makes the attendance of all children between the ages of eight and 14 compulsory, prescribes standard courses of eight or nine years in elementary schools and four years in high schools, including studies which will enable their pupils to meet the standard entrance requirements for college, and provides free tuition, textbooks and school supplies for all pupils in both elementary and high schools. From 1647 to 1805 the territorial unit for government and taxation for school purposes was the township; in 1805 when the dispersion of population throughout the towns had become general this unit was changed to a subdivision of the township known as the district, each town determining the number of its districts. In 1885 the growth of the factory system and the trend of population to villages and cities led the State to re-establish its original town system for the administration and support of public schools. The amount raised by town taxation for public schools is supplemented by the proceeds of a literary fund established in 1823 and derived from non-resident and savings bank taxes. This fund enabled the State to distribute to the towns in 1916 the sum of \$43,277.65, or 65 cents per scholar. In 1915-16 the total amount expended for public instruction, as reported by the Commissioner of Education of the United States, was \$2,148,985, the number of pupils enrolled in the public schools was 67,461, or 15.25 per cent of the total estimated population in that year.

In 1920 the number of persons of school age (between five and 20 years) in the State was 120,666 and the number reported as attending school was 80,127 or 66.4 per cent. The number of children in the State between five and 18 years in 1920 was given as 99,775. Of these the number enrolled was 64,205 and the daily average attendance was 53,245.

In 1920 there were 15,788 illiterates in the State, representing 4.4 per cent of the total population 10 years and over, as compared with 6.2 per cent in 1900. The percentage of illiteracy was 15.4 among foreign-born whites and 0.7 among native whites. For persons from 16 to 20 years of age, inclusive, whose literacy depends largely upon present school facilities and school attendance, the percentage of illiteracy was only 1.1. The State has many private secondary schools, academies and institutes. Two of these are among the most famous in the country, Phillips Academy at Exeter, established in 1783, and Saint Paul's School at Concord, founded in 1855. There are three higher institutions of learning. The oldest, Dartmouth College, located at Hanover on the Connecticut River, is the seventh oldest college in the country and was chartered in 1769 for "the education of Indian and other youth," but soon ceased to have Indian pupils except at rare intervals. In 1819, when it still was a "small college," the United States Supreme Court in the celebrated case, *Dartmouth College v. Woodward*, 4 Wheat. 518, which involved the power of New Hampshire to change the college charter without the consent of its trustees, rendered judgment for the college and by its effects refounded it and

also confirmed the rights and privileges of all private corporations in the United States. (See *DARTMOUTH COLLEGE CASE*). Its subsequent growth, especially during the last quarter of a century, its enlarged endowment and multiplying educational facilities have united to make it one of the largest colleges in the country. The New Hampshire College of Agriculture and the Mechanic Arts was established in 1866, pursuant to the provisions of the Morrill Land-Grant Act of Congress of 1862, and since 1891 has been located at Durham near Portsmouth. It is the highest educational institution under the direct control of the State and is coeducational. It is supported by annual appropriations by the State, the proceeds of grants under different acts of Congress from the United States and the income from its endowment by a citizen of Durham, which in 1922 amounted to nearly \$800,000. Anselm College established in 1895 at Manchester is a Catholic institution.

Libraries.—New Hampshire has been a pioneer in and sturdy supporter of the library movement. Perhaps the earliest mention we have of it is in connection with a lottery in Portsmouth in the year 1750 in aid of an association library. From 1792 to 1883, 220 libraries received special charters from the legislature. These were mostly private library corporations which have now given place to, or become merged in, the public library. The first free public library in the United States was established in Peterborough in 1833. The State was in 1849 the first to pass a law authorizing towns to aid in establishing and maintaining public libraries. This was followed logically by the second and third steps in the progress, namely, by the law of 1891 granting State aid to town libraries, and by the compulsory law of 1895, requiring every town to appropriate a certain proportion of its taxes for the support of a public library. In 1916 there were free public libraries in all except 12 of the towns of the State. The first legislative incorporation of a State library association was by New Hampshire in 1889. The number of books contained in the public libraries and accessible to the public, exclusive of reports and pamphlets, is 900,000. The State Library now occupies a separate establishment and in 1922 had a collection of 180,000 bound volumes.

Religion.—The principal Protestant denominations are the Congregationalists who aggregate approximately 20 per cent, the Baptists 17 per cent and the Methodists 12 per cent of all church members. The Roman Catholic population now is estimated to number approximately 130,000, or 30 per cent of the entire population of the State.

History.—Three of the four original towns, Portsmouth, Dover, Exeter and Hampton, occupied the interesting position of independent democracies between 1622, the year when Thomson's indenture was drawn and the first settlement definitely planned, and 1643, when they had all become, by their own choice or the necessities of their situation, constituent parts of the Massachusetts Bay Colony. This was the first union with Massachusetts Bay, and was conditional on certain important privileges and guarantees accorded to these towns by the Massachusetts General Court. The history of the period of this union is in a large measure identical with that of Massachusetts Bay. In

1679 the Masonian heirs succeeded in procuring from the home government orders for the establishment of a separate province for these four frontier towns and other lands in New Hampshire. John Cutt, a merchant of Portsmouth, was the first president, as the chief magistrate was then styled. The four towns were made a part of the dominion of New England in 1686. This government under Dudley and Andros survived only three years. From the spring of 1689 to the latter part of the winter of 1689-90 the New Hampshire towns governed themselves in the independent democratic fashion of the first period of their history. A second union with Massachusetts Bay was then effected and continued for two years. In 1692 the province government by royal commission was re-established and subsequently administered by appointees of the Crown until 1775. With the governor was associated a lieutenant-governor and a council appointed by the king. The legislative function was vested in a general assembly constituted of the governor, the council and the deputies, elected by freeholders. The right of veto was committed to the governor and the right of confirmation and disallowance of laws remained with the Crown. From 1699, when the Earl of Bellomont assumed the office of governor, to the termination of Belcher's administration 1741, the province and Massachusetts had the same governor. The provincial assembly was continued until the departure of Gov. John Wentworth in 1775. A succession of conventions beginning with that of 21 July 1774 finally resulted in the formal organization of a legislative body with a full representation of the people in view of the apparent necessity of establishing a new State government. The people of New Hampshire entered upon the active stages of a national movement for independence with deliberation and unanimity. Perhaps no other colony was so free from the so-called Loyalist element as was New Hampshire. The "Association Test" put every man on record, either for or against the common cause. The original files are preserved, and the names of those who dissented or refused to take an unequivocal position constitute a surprisingly short list.

The civil government of New Hampshire from the time of the departure of Governor Wentworth to the organization of a new form of government, 2 June 1784, under the constitution adopted in 1783, was purely legislative. The constitution of 1776, the first adopted by any of the 13 States, by its own independent action, was a brief instrument and evidently intended to be temporary, or, as it was officially stated at the time, "to continue during the present, unhappy and unnatural contest with Great Britain." It was adopted and promulgated on 5 Jan. 1776, by the fifth convention, chosen in the latter part of 1775, and it was never submitted for acceptance or rejection to, or formally ratified by, the people. During the period of the Revolution the administrators of the New Hampshire government were embarrassed by a serious defection in the western part of the State, and particularly in Grafton County. Many of the leading men of the Connecticut River towns were from

naturally in accordance with their education and experience in the commonwealth from which they had emigrated. The form of government temporarily adopted by the Fifth Provincial Congress was not acceptable to the majority of the inhabitants of these towns. The group of towns which include Gunthwait (now Lisbon) on the north and Lebanon on the south in Grafton County organized themselves into associations for purposes of civil and military government, and formally declined to recognize the new State government of New Hampshire. The contention of the "New Connecticut" party, so called, was, that upon the dissolution of political relations between the colonies and the mother country, and more especially in respect to the territory in controversy between New York and New Hampshire, the towns being the political units and the original source of political authority were invested with the right to determine for themselves the question whether to accord allegiance to one or the other of the disputing States, or to erect themselves into an independent State. They urged that inasmuch as the constitution of 1776 had never been submitted to the people, or to the towns for ratification, and had been accepted by a part of the towns only, it was operative only upon such as had elected to ratify its provisions. Their argument was presented with great skill and effectiveness, and although the movement ultimately failed to accomplish its purpose, its sponsors succeeded in making themselves felt as a political force to be reckoned with by three established States and the Continental Congress as well as the prospective commonwealth of Vermont. In 1783 a new State constitution, modeled closely upon the Massachusetts constitution of 1780, was adopted. This first permanent constitution of New Hampshire which took effect 2 June 1784, except as modified by amendments proposed by the subsequent conventions of 1791-92, 1850, 1876, 1889, 1902 and 1912, still remains in force. In this critical period of American history (1783-89) when the Federal convention of 1787 framed and submitted to the 13 States for adoption the present constitution of the United States, it became the organic law of the new nation on its ratification by New Hampshire, the ninth State, on 21 June 1788. John Langdon of New Hampshire was chosen president pro tempore of the first session of the United States Senate under the new Constitution, and to him fell the honor of informing Washington of his election to the presidency. In the next decade soon after the Federalist party arose it secured political control in this State, but gave place to the Anti-Federalists, then known as Republicans—the Jefferson party of that day—from 1805 to 1813, except in 1809-10, when Jeremiah Smith, Federalist, broke in upon the succession as governor. In 1813, 1814 and 1815 the Federalists were again in control of the State. In 1816 they met with irretrievable defeat, and thereafter the Jeffersonian Republicans, who later were styled the Democratic party, remained in power, excepting in the brief period of a temporary reverse in 1846, until permanently overthrown in 1855 by the American party, more commonly called the "Know-nothings." The first quarter of the 18th century was marked by ecclesiastical agitation. The

people of New Hampshire had become by the end of the colonial period almost entirely Congregationalists, and that denomination maintained its ascendancy as practically a state church during the following generation, the town ministers being called by the local church, approved in town meeting and supported by public taxation. Universalists, Baptists, Methodists and Free Thinkers now had become potent enough to assert themselves effectively in politics, and the contest against the state church reached its culmination in the so-called toleration act of 1819. Hosea Ballou, a New Hampshire minister, was the founder of Universalism in its modern form, and Benjamin Randall, another minister of this State, was the founder of the Free Baptist denomination. The latest addition to religious denominations by a resident and native of this State is that of Christian Science, the founder and chief exponent of which was Mary Baker Eddy. In 1819 the Supreme Court of the United States rendered its judgment in the historic Dartmouth College case (4 Wheaton, 518) which has been described as one "in its effects more far-reaching and of more general interest than perhaps any other judicial decision ever made in this country." Through this futile attempt by the State to amend the charter of Dartmouth College for the purpose of reorganizing the government of that institution, an inviolability of charters of private corporations never before enjoyed was secured. Incidentally the case served to make prominent and to bring into view of the whole country the fact that in Daniel Webster, Jeremiah Mason, Jeremiah Smith, Ichabod Bartlett, and their compeers, there was at the bar of New Hampshire, and on the bench of her highest court, a group of jurists whose law learning and forensic ability could not be surpassed at that day in the whole country. In 1826 occurred the anti-Masonic uprising, which soon affected politics, and for a time commanded serious attention. The second quarter of the 19th century was remarkable for the number of men of New Hampshire birth and residence who held commanding positions in shaping the destiny of the republic. The names of Webster, Cass, Woodbury, Pierce, Kendall, Chase, Hale, Atherton, Clifford, Tuck and Greeley constitute a conspicuous part of a long list that might be enumerated. The years between 1846 and 1861 were marked by the development of a strong reform sentiment, especially on the subjects of temperance and slavery. In the case of the former, the reform movement resulted in the prohibitory law of 1855, which became the accepted principle of liquor legislation until at length a reactionary sentiment expressed itself in the License Act of 1903. After 15 years experience under this act with its local option provision, the State again reversed its policy and enacted a "bone-dry" prohibition law which took effect 1 May 1918. In the case of the latter the anti-slavery movement found many earnest and devoted adherents, intense and uncompromising in their propaganda. The Freesoil vote had already appeared in 1841, and continued to be of more or less importance until 1856. Since 1856 when the Republican party secured control of the State, with the exception of a signi-

ficant revolt from it in 1872, and numerous transfers of party allegiance during the Free-

silver agitation in 1896, party alignments have been quite strictly maintained. Since 1856, the Republican party has had control of every department of the State government and carried every State election except in the years 1871, 1874, 1912 and 1922. In 1916 the Democratic party though failing to secure control of any department of the State government carried the State for its nominees for President and Vice-President, Wilson and Marshall, by a plurality of 56.

Editor of Manual of Constitution of New Hampshire.

NEW HAMPSHIRE, University of, a State co-educational institution, founded in 1866 and located at Durham, N. H. Until, under legislative enactment, it was given its present name on 1 July 1923, it was known as the New Hampshire College of Agriculture and Mechanic Arts. Courses are offered leading to the degrees of Bachelor of Arts and Bachelor of Science. The university's grounds, buildings and equipment were valued in 1923 at \$1,880,300 and the same year its productive funds amounted to a total of \$1,030,000. Its income from various sources in 1922-23 was \$870,881. On 1 Dec. 1923 students enrolled numbered 1,121. Of these, 845 were men and 276 were women. At the same time the teaching staff numbered 90. A summer school is conducted by the university. The library contains over 47,000 volumes.

NEW HANOVER, an island of the Bismarck Archipelago (q.v.), about 40 miles long and 20 miles broad, northwest of New Ireland, or New Mecklenburg (q.v.), from which it is separated by Byron Strait.

NEW HARMONY, Ind., town, in Posey County, on the Wabash River, and on the Illinois Central Railroad, about 25 miles in direct line northwest of Evansville. The first settlement was made by a German community called Harmonists (q.v.), in 1815. In 1824 Robert Owen purchased the village and domain and the Harmonists returned to Pennsylvania. The next year Owen established a "Preliminary Society" and issued a general invitation to all "the industrious and well disposed of all nations" to join the new community which was to be governed and conducted on new plans. All goods were to be held in common, but their use was regulated by age; "moral lectures" were to replace religious worship; the young were to be educated by trained teachers, and this education was to begin when the children were two years of age. The whole experiment proved a failure; those who accepted the invitation were not all "well disposed" and many were far from "industrious." In 1826 Owen assumed control of the community and established order; but in a few months dissensions

arose, three communities were formed of the original one, and soon after the "community idea" was abandoned. One of the leaders, William Maclure, purchased part of the land and established an industrial school which also was a failure. Thomas Say was a member of the community and here was issued in 1830 his work on conchology. The geologist, David D. Owen, also resided here. The free library of the Workingmen's Institute, established in 1838, is in a most flourishing condition and contains about 16,000 volumes. The town has some manufacturing establishments, chief of which are flour and lumber mills and brick works. The electric-lighting plant is the property of the municipality. Pop. 1,126. Consult Lockwood, G. B., 'The New Harmony Communities' (New York 1905).

NEW HAVEN, Conn., city and county-seat of New Haven County, and the largest city in the State. It is popularly called "the City of Elms" from the magnificent elm trees planted there over 100 years ago. New Haven lies at the head of New Haven Bay, four miles distant from Long Island Sound. It is on the New York, New Haven and Hartford Railroad, 36 miles from Hartford and 74 miles from New York City.

Topography.—The city lies on a level sandy plain, bordered on the east and west by the West and Quinnipiac rivers. It has an area of 23 square miles. "The Old Green" is a public square in the centre of the city, about which the original settlers lived, and used at night as a corral for their cattle. It also for years was the public burial ground. The bones of thousands lie there to-day. Near the city limits rise East Rock and West Rock, 360 and 400 feet in height respectively, from the summits of which a fine view of the city and surroundings may be obtained. East Rock, which has been made into a park, is crowned at its summit by a monument dedicated to the Connecticut soldiers and sailors who fell in the Civil War. The entire park system in New Haven embraces nearly 1,200 acres. The sewer system is most complete, including 95 miles of sewer.

Streets and Avenues.—Chapel street, the business promenade, extends in a northwesterly direction throughout the length of the city. The homes and dwelling-houses are generally surrounded by gardens, and many of them are almost hidden from view among trees. The number of magnificent elms with which the principal avenues are planted were mostly set out about the close of the 18th century by James Hillhouse, or through his influence and example. Early residents laid out the city with four streets running nearly north and south and four streets running east and west, thus dividing the city into nine squares each a quarter mile long, the central block being a public square, and roadways were built at various angles, with "The Old Green" as a common centre. There are 225 miles of streets and avenues.

Prominent Buildings.—Here is the seat of Yale University (q.v.), with its numerous halls, dormitories schools and special buildings which are celebrated in educational and historical annals. The Yale Campus, which lies directly west of "The Old Green," is a rectangle containing two city blocks. A series of college buildings form an enclosed court about the

campus. Two of these buildings, Vanderbilt and Osborn Halls, are among the chief architectural attractions of the city, though Woolsey Hall is the most beautiful of all the university buildings. The Sheffield Scientific School and the departments of law and medicine are a little removed from the campus. The Hopkins Grammar School, founded in 1660, is also located here. Other buildings and institutions are the Art School; the Peabody Museum; the State Normal School; the Hotel Taft; the Boardman Manual Training School; the Hillhouse High School; New Haven Hospital; Grace Hospital; Saint Francis Roman Catholic Orphan Asylum; The University Library (1,000,000 volumes); the Public Library, containing 117,000 volumes; New Haven Orphan Asylum and the Young Men's Institute. Here are also the archives and libraries of the New Haven Colony Historical Society and the American Oriental Society.

Churches and Schools.—New Haven has several churches, some of which were built as early as 1800. In the old burying ground in Grove street are the graves of Noah Webster, Theodore Winthrop, Eli Whitney, F. B. Morse, Timothy Dwight, Roger Sherman, Lyman Beecher and other celebrities. The churches are divided among the following denominations: Congregational, Methodist Episcopal, Protestant Episcopal, Roman Catholic, Baptist, Lutheran, Jewish, and Universalist, Unitarian and others. There are 55 public school buildings in the city, with a daily attendance of about 30,000. The school system is maintained at a cost of \$850,000 annually.

Trade and Commerce.—New Haven up to the middle of the 19th century was an important shipbuilding centre, but this industry has gradually diminished. Shipbuilding interests were seriously crippled by the Embargo (q.v.) and the War of 1812. There is an excellent natural harbor here which has been improved and enlarged at State and Federal expense. New Haven has lines of steamships to New York and is the commercial and distributing centre for a large section of the State. In manufacturing New Haven ranks first among Connecticut cities, and has many and varied industries, including clocks, watches, hardware, firearms, ammunition, wagons, carriages, engines and boilers, automobiles, rubber goods, wearing apparel, iron foundries, machine shops, box factories, wire work factories, canneries and packing-houses. The headquarters and repair shops of the New York, New Haven and Hartford Railroad are also located here. According to the last census, New Haven industries represent a capital of \$52,014,000 with an annual production valued at \$51,071,000. Over 27,000 persons are employed in the 590 factories of the city and over \$16,238,000 are annually paid in wages. The city has a dozen national banks, and numerous trust companies, State banks, savings banks and buildings and loan companies.

Government.—The city maintains municipal government under a special charter of 1897, which controls all municipal affairs, including the old school district of New Haven; but the 13th ward of New Haven, Westville, is independent of the city in the management of its schools. A mayor, elected every two years, is the city's chief executive, and he has the power to appoint a majority of the municipal administrative officers. The city affairs are adminis-

tered by a board of aldermen of 21 members, which appoints the assistant city clerk. The sheriff, city treasurer, collector of taxes, city clerk and comptroller are elected every two years by popular vote. The board of selectmen consists of seven members elected for the purpose of admitting electors to the voting privilege. The administration of the school district is in the hands of a board of education of nine members, appointed by the mayor. The fire and police departments of the municipality are managed by boards of commissioners, the latter bi-partisan. The central clearing house is the board of finance, which fixes the rate of taxation and makes the appropriations.

Municipal Finances.—The assessed valuation of real and personal property is about \$148,500,000, including exemptions. The provided debt of the city amounts to \$4,120,648. The city expends each year for maintenance and general expenses \$2,300,000; of which the largest item is \$1,046,000 for schools; police department, \$256,453; fire department, \$275,000; street cleaning and public works, \$383,500; lighting, \$88,000; charity, \$133,000.

History.—New Haven was settled in 1638 by a company of Puritans chiefly from London under Theophilus Eaton, their first governor, and the Rev. John Davenport. It was a distinct colony until 1660, when after a protracted struggle it was united with Connecticut under the charter of 1662. It was incorporated as a city in 1784. In its earliest days New Haven was called Quinnipiac by the Indians. It was also called Roodenberg by some of the early colonists. The Indian chief Momacguin sold a large tract of land here to the London company, receiving in return an assortment of coats, hatchets, spoons and knives. Treaties were signed by both parties, the Indians agreeing not to "terrify, disturb or injure" the settlers, who in turn promised to protect the Indians, and allow them to hunt in portions of the ceded territory. Another tract 10 miles wide by 12 miles long was purchased six months later, and in June 1639 a fundamental and written constitution was adopted by the settlers. The privilege of voting and holding office was strictly limited to church members. In both civil and church affairs the Bible was the only recognized law.

Theophilus Eaton, the first governor of the New Haven Colony, was re-elected and retained the office until his death in 1658. The city of New Haven was incorporated in 1784 and Roger Sherman was its first mayor. He was mayor and United States senator when he died. The boundary of the Connecticut Independent Colony under its charter of 1662 embraced the towns of Milford,* Stamford, Guilford and Branford known as the "New Haven Colony," and in 1665 the New Haven towns submitted to the Connecticut charter. In 1701 New Haven was made a joint capital with Hartford, and remained as such until 1874. Yale College was removed from Saybrook to its present site in 1716. The town was captured 5 July 1779 by a British force under Generals Tryon and Garth after a sharp skirmish. In this engagement the Americans lost 29 killed and 17 wounded, while the British loss was 70 killed and 40 wounded. After its incorporation as a city New Haven began to make rapid strides. Steamboat communication was opened with New York in 1815,

and the first railroad entered the town in 1839.

Population.—In 1800 New Haven had a population of 4,049; (1850) 20,345; (1870) 50,840; (1880) 62,882; (1890) 81,208; (1900) 108,027; (1910) 133,605; (1920) 162,519, including about 93,000 of foreign birth or parentage.

E., 'History of the City of New Haven' (1887); Barber, 'History and Antiquities of New Haven' (1870); Bartlett, 'Historical Sketches of New Haven' (1897); Lambert, 'History of the Colony of New Haven' (1838); Levermore, 'Republic of New Haven' (1886); and 'Papers of the New Haven Colony Historical Society' (1865-1902); New Haven *Year Books* and reports of its Chamber of Commerce.

NEW HAVEN COLONY. See NEW HAVEN, CONN.

NEW HEBRIDES, hēb'ri-dēz, a group of islands in the south Pacific, east of Australia, extending from lat. 13° to 20° S., and from long. 165° to 170° E.; area, about 4,900 square miles. The largest ones are Mallicolo and Espiritu Santo (q.v.). Tanna has an active volcano; and in consequence probably of volcanic action, Aurora, one of the most fertile, sank out of sight in 1871. Some of the group are of coral formation. They are all wooded and hilly, ebony and sandalwood being obtained; their chief products are maize, millet, yams, bananas, coconuts and sweet potatoes. The chief animal is a small pig, not larger when full-grown than a rabbit. The native inhabitants, belonging to the Papuan race, are in general degraded and very ferocious, except on Aneityum and others in the south of the group, on which cannibalism and headhunting were rampant until the advent of Presbyterian missionaries in 1848, who achieved so marvelous a success as to excite the wonder and admiration of Protestant Christianity. There are also successful French Catholic missions on the islands. These islands, according to the Anglo-French convention of 1906, are under the joint control of a mixed commission of French and British officials. The population is decreasing; in 1916 it was about 70,000. They were discovered by the Portuguese in 1606, and named by Captain Cook in 1774. Consult Elkington, 'The Savage South Seas' (1907); Grimshaw, 'Fiji and its Possibilities' (1907); and Paton's, 'Letters and Sketches from the New Hebrides.'

NEW HOPE CHURCH, Ga., the scene of an engagement during the Civil War between the forces of the Confederate Johnston and the Federals commanded by Sherman. The engagement was but one of the very many fought in Sherman's drive on Atlanta in the spring and summer of 1864. The engagement at New Hope Church took place 24 May 1864, and for a time the fighting was intense, the Confederates being protected by log barricades and having a good supply of well-posted artillery.

NEW IBERIA, i-bē'ri-ā, La., town, parish-seat of Iberia Parish, on the Bayou Teche, and on the Southern Pacific Railroad, about 100 miles in direct line west of New Orleans. A short railroad extends to Avery Island, where there is a valuable salt-mine. It is in a fertile agricultural section, in which the chief products are the pepper, from which tabasco sauce is made, cotton, sugarcane, corn, rice, vegetables

and berries. It has considerable manufactures; some of the industrial establishments are machine-shops, a knitting-mill, shipyards, foundries, wagons, brick works, soap factories, cottonseed-oil mills, factories for different lumber products and tabasco sauce factory. The town is in a section of the State mentioned by Longfellow in 'Evangeline.' It has a government building, a city-hall and a large public market. Its educational institutions are the public and parish schools for white and colored children, a high school and a public high school library. The city, which has adopted the commission form of government, owns and operates the electric-light plant and the waterworks. Pop. (1900) 6,815; (1910) 7,499; (1920) 6,278.

NEW IRELAND. See NEW MECKLENBURG.

NEW JERSEY, the "Garden State," and one of the original 13, adopted the Federal Constitution by unanimous vote in convention 18 Dec. 1787. The State is bounded on the north and east by New York and the Atlantic Ocean, on the south and west by Delaware and Pennsylvania. Of the 487 miles of total frontier, only 48 miles are defined by natural boundaries. Capital, Trenton. Area, 8,224 square miles, of which 710 square miles is water surface. The extreme length of the State is 166 miles, the narrowest portion being 33½ miles. Pop. (1900) 1,883,669; (1910) 2,537,167; (1915, State census) 2,844,342; (1920) 3,155,900.

Topography and Geology.—The topographic features and geological structure of the State are intimately related and are explanatory of the surface conditions. New Jersey is characterized as being on the Atlantic slope of the continent and is divided into four topographic zones: (1) Appalachian, including the Kittatinny Mountain and Valley. (2) Highlands. (3) Red sandstone or Triassic area. (4) Coastal plain.

The Appalachian zone includes the Kittatinny or Blue Mountain and the Kittatinny Valley, occupying the northwestern portion of the State. This range is level-topped, narrow, rough, rocky and heavily wooded. It extends across New Jersey from the New York State line, where it is known as the Shawangunk Mountain, to the Delaware River at the Delaware Water Gap. At High Point, near the northernmost point of the State, it is 1,804 feet high, which is the greatest elevation of the State. The Kittatinny Valley, 10 to 13 miles wide, is shut in by the Kittatinny Mountain on the northwest and by the Highlands on the southeast. It is characterized by high, rolling hills and minor valleys, pleasing landscapes and beautiful farming country. This valley is continuous, on the northeast, with the valley of Orange County in New York, and to the southwest stretches away into the great Cumberland Valley of the Atlantic slope of the continent.

The Highlands cross New Jersey in a general north-northeast and south-southwest direction. The surface of this zone is hilly-mountainous, and is made up of several parallel ridges, separated by deep and generally narrow valleys. The latter are like the Kittatinny Valley—smooth—and are largely cleared and in farms. The mountain ranges are remarkably

uniform in height. This division may be considered as a seaward-sloping table-land, whose northwest side has an elevation of 1,000 to 1,500 feet above the ocean and its southeastern side 600 to 900 feet above the sea. In the northern part there are several lakes elevated amid the mountains—Hopatcong, Greenwood, Macopin, Splitrock, Green, Wawayanada and Budd's being the more important of these natural upland sheets of water.

The Red Sandstone Plain or Triassic Area, also called the Piedmont plain, is bounded on its northern border by the Highlands. On the southeast, this third great topographic zone merges into the clays and marls of the coastal plain. It is 67 miles long and 30 miles wide at the Delaware River. The traprock ridges, known as Palisades, Watchung, Sourland, Cushetunk and other mountain ranges, rise abruptly above the general level of the sandstone plain. They are generally forested, whereas the sandstone country is nearly cleared and in farms. These mountains rise 400 to 900 feet above sea-level. The drainage is largely by the Hackensack, Passaic and Raritan rivers and their tributaries.

The fourth zone, known as the coastal plain, includes all the country southeast of the Triassic sandstone area and borders the ocean. This zone is about 100 miles long from Sandy Hook to Salem City, and is 10 to 20 miles wide. The surface is hilly in part, but with gentle slopes, except where some of the streams have cut their way through its earthy beds and formed steep-sided stream valleys. The Navesink Highlands and the Mount Pleasant Hills are the highest lands in this zone. The drainage is by many tributaries westward into the Delaware and by the Atlantic Coast streams into the Atlantic Ocean. In the northwestern part of this zone there are clay beds and greensand marls, which make the outcrop on the surface in places; on the southeast there are sands, clays and gravels and fringing the sea a narrow range of sand hills or coastal dunes. Within the coastal plain lie the "Pines," a wooded area of so great an extent as to contribute largely to the forest acreage of New Jersey. In lots of 10 acres and over, there are 2,070,000 acres of woodland, with only 2,000,000 acres of improved land in farms. The famous sea-wide resorts of the State fringe the coastal plain.

As set forth by Prof. John C. Smack, the geologic structure of New Jersey is so related to the topography that observations concerning the physical features give a satisfactory clue to such structure. All of the larger geological formations of the United States, except coal, occur in parallel zones, as has been indicated. These formations extend from northeast to southwest and a section line across the State from Port Jervis southeast to the ocean crosses them nearly at right angles to their trend. The oldest geological formations in the State are the crystalline rocks of the Highlands. Granite, gneisses and other crystalline schistose rocks and beds of magnetic iron ore make up the mass of these mountain ranges. These rocks are generally much tilted in position, almost on edge and are also much faulted. They strike northeast and southwest and dip to the southeast or northwest. The iron ores and zinc ores which are mined in the State are found in these formations. The granite, gneiss

and crystalline limestone or marble, used in building, are also from these Highland formations.

The Palæozoic rocks are found in the valleys included in the Highlands, in the Kittatinny Valley and Kittatinny Mountain and in the Green Pond and Copperas mountains. Cambrian, Silurian and Devonian are represented and the rocks are limestones, slates, sandstones and silicious conglomerates. The magnesian limestones and the slates constitute wide belts in the Kittatinny Valley, the Musconetcong, Pohatcong, Pequest and other valleys. The Kittatinny Mountain mass consists of sandstones and conglomerates of the Oneida and the Medina epochs of the Silurian Age. In the valley of the Upper Delaware, west of this mountain, there are narrow belts of waterlime, Lower Helderberg and Upper Helderberg, fossiliferous limestones, with Marcellus shale as the highest member of the Devonian within the State. The Green Pond Mountain rocks also have been referred to the Oneida horizon. The limestones and slates are the formations on which the rich wheat lands of Warren County and the dairy farms of Sussex are situated. Stone for building, slate for roofing and flagging stone and limestone for lime and cement, are quarried in the Palæozoic areas. Copper, lead and zinc ores and barite, limonite or brown hematite and glass sand have been worked in many localities.

The red shales and sandstones and the included trap-rocks of the northern-central part of the State are referred to the Juras-trias of Mesozoic time. The sandstone beds dip in general toward the northwest, at a low angle of inclination in the sandstone. The erupted trap-rocks form long ranges of steep-sloping hills or mountains, often crescentic in form. A great deal of excellent sandstone for building and stone for road-making is quarried in this formation. Copper ores occur in the sandstone near the trap-rock or at their junction. Barite also has been mined in the sandstone at one locality.

The cretaceous rocks of the State include the clay district of Middlesex County and the greensand marl developed in Monmouth County and thence southwest to Salem County. A large amount of clay is dug in the Raritan clay district. The greensand marl, dug in shallow pits generally and in numberless localities, has had a wide use locally as a fertilizer.

The formations of the coastal plain zone, later than the cretaceous beds, are greensand marls of the Eocene, clays and sands of the Miocene and the clays, sands and gravels of the post-Tertiary. They are recognized in a fourfold division and are known as Beacon Hill, Bridgton, Pensauken and Cape May formations. Clays and sands for brick, terra-cotta and pottery, marls for fertilizer, glass sands and gravel for road-building are dug in these formations.

In the northern part of the State there are surface formations of glacial epochs and the terminal moraine of the last glacial ice is traced from Perth Amboy by Morristown and Hackettstown to Belvidere on the Delaware.

Alluvial deposits of recent time are recognized in the river valleys and in the tidal marshes and in some of the fresh-water swamps.

Economic Geology.—To the early settlers the mineral wealth of the State was well known. Before the Revolution, copper, "bog" iron, brick clay and glass sand were exploited. At the present time New Jersey is the only State of any importance as a mineral producer in which the utilization of its clay resources constitutes the chief industry and represents over 50 per cent of the total value of all minerals produced. The clay products of this State, moreover, include every variety of brick and tile and every variety of pottery produced in the United States as classified by the National Geological Survey. The clay-working industry reached high record in the calendar year 1921, when the total value of the clay products was \$27,214,685, of which \$11,421,609 was represented by the output of the brick and tile establishments and \$15,793,076 by the output of the potteries. The State ranked first in the production of china and sanitary ware; second in the value of pottery products; third in the value of all clay products; among the first five States in the production of most of the varieties of clay products. Clay for the manufacture of ordinary brick is dug in 20 out of the 21 counties of the State. Mercer County is the most important clay-working county. Its principal product is sanitary ware. Trenton is the centre of the pottery industry. Middlesex County, ranking second, is the principal producer of common brick, architectural terra-cotta, fireproofing tile (other than drain tile) and fire brick. Bergen County ranks third in the manufacture of common brick; Burlington, Camden, Gloucester, Mercer and Middlesex counties produce fire clay; Mercer and Ocean counties, saggar clay; Camden, Essex, Monmouth, Morris and Union counties, pottery clay; and Middlesex County (at Woodbridge, Sayreville and South Amboy), ball and slip clay.

Based upon the recoverable metallic content of the ore mined New Jersey is one of the most important producers of zinc and zinc-ore mining is second in importance among the State's mineral industries. In the quantity of zinc contained in the ores mined, New Jersey ranks second among all the States, being exceeded only by Missouri. The value of the metallic content of the zinc ore mined in 1912 was \$9,626,191. In 1922 the State produced more zinc than all the other Eastern States, the total being nearly 112,894,000 pounds. The centre of this industry is the famous Franklin Furnace district in Sussex County, where mining has been carried on continuously for more than 60 years.

Third in importance among the mineral industries is the manufacture of Portland cement, the plants in the vicinity of Phillipsburg, in Warren County, being the eastern end of the celebrated Lehigh district of Pennsylvania. The value of the output in 1912 was \$3,052,098; in 1913, \$3,638,755; in 1921, \$4,820,538.

The principal quarry product is trap rock, used chiefly for road making and concrete, the Palisades region and especially Somerset, Passaic, Hunterdon, Essex and Hudson counties yielding the largest output. The total value of all stone, exclusive of serpentine quarried in the State in 1921 was \$2,634,738, nearly 80 per cent of which was that of the trap rock product.

Limestone, used in the manufacture of cement, as crushed stone for concrete and macadam and for blast furnace flux, is quarried chiefly in Sussex County, with smaller quantities in Hunterdon and Warren counties. Granite and sandstone are also produced in small quantities, the former in Warren, Passaic and Sussex counties and the latter chiefly in Bergen and Mercer counties.

New Jersey is one of the four leading States in the production of molding sand, the output in 1917 having a value of \$651,279; building sand yielded \$545,437; and in 1921 sand and gravel yielded \$2,436,298. Building and molding sands are dug in many counties, particularly along the eastern borders; fire sand for fire brick is produced in Middlesex County; filter sand in Burlington and Cape May counties; and glass sand in Camden, Cumberland, Gloucester and Middlesex counties.

Iron ore shipped from the mines in 1917 had a value of \$2,341,160. Iron ore sold to furnaces in 1921 had a value of \$551,688. Other commercial products of the State are occasional gems, lime, manganiferous zinc residuum, mineral paints, mineral waters, sand-lime brick, slate and talc.

The following shows the variations in the values of all mineral products in the most notable years: 1912, \$37,195,940; 1913, \$37,271,129; 1914, \$31,756,503; 1921, \$47,429,290.

Agricultural Interests.—Possessing a great diversity of soils and a somewhat notable variation in temperature, New Jersey has ever occupied a distinctive position as an agricultural community. The average yearly temperature ranges from 49.6° in the Highlands to 53.0° on the sea coast. The average annual precipitation, including melted snow, is 47.18 inches in the Highlands and 45.92 inches on the sea coast. Aside from the staple crops the fruits of the State have a large sale in the nearby markets of Philadelphia and New York. Peaches and apples are extensively grown in the northern and northwestern portions of the State, while pears are cultivated in the midland counties. These fruits are common, however, in all sections. The southern counties produce large acreages of strawberries, raspberries and blackberries, while cranberries are a staple product of boggy areas in Burlington and Ocean counties. Grapes are grown extensively in the southern section of New Jersey, while plums, cherries and currants are common in all sections. Huckleberries are of spontaneous growth and are gathered in large quantities. In truck farming, watermelons and cantaloupes, the Hackensack variety of the latter competing with the Colorado product, are grown on the large plantations and small farms near Philadelphia and New York. Market gardening, owing to the reasonable price of land and extensive stone-road system and quick, cheap and safe transportation by rail and boat, is a profitable industry in New Jersey, more particularly in the vicinity of New York. Commercial floriculture gives to the State a pre-eminence. Dairy-ing is largely confined to the northern, central and southwestern portions of the State. The poultry farms of New Jersey are near the markets of Philadelphia and New York. The forest lands, including stump and brush lands to merchantable timber, of the State occupy about 2,000,000 acres; the cleared farm land about the

same acreage; 1,200,000 acres of forest land is coniferous, pitch pine on the uplands and white cedar in the swamps. This is the region known as the "Pines," extending from Lakewood on the north to Cape May County on the south and embracing a number of health resorts. The northeastern Highlands, with 210,000 acres, the Kittatinny Mountain with 58,000 acres, the Palisade Mountain with 11,000 are the remaining large forest areas. The forest products are worth about \$4,000,000 annually. The State renders directly and indirectly great assistance to agricultural interests by the media of an agricultural college located in New Brunswick, experiment stations, a board of agriculture, grange and horticultural society. Reports, institutes and lectures are the means of disseminating information.

According to the United States census of 1920, the State had a total of 29,702 farms, comprising 2,282,585 acres, of which 1,555,607 were improved. The value of the land was reported as \$142,182,498; buildings, \$108,141,488; implements and machinery, \$25,459,205; and livestock, \$36,064,757; total value of all farm property, \$311,847,984, an increase of \$57,015,283 in 10 years. The staple crops in the preceding year, in the order of production values, were potatoes, \$21,670,546; corn, \$14,480,577; hay and forage, \$14,017,095; wheat, \$3,087,324; rye, \$1,722,461; oats, \$1,403,453; and buckwheat, \$182,009. Small fruits had a farm value of \$3,526,203. Crop reports for the calendar year 1922 showed: Corn, 236,000 acres, 9,912,000 bushels, \$6,938,000 farm value; winter wheat, 77,000 acres, 1,540,000 bushels, \$1,694,000, value; oats, 72,000 acres, 2,232,000 bushels, \$1,228,000, value; barley, 10,000 acres, 220,000 bushels, \$253,000, value; rye 61,000 acres, 1,159,000 bushels, \$985,000, value; cranberries, 11,000 acres, 200,000 barrels, \$3,950,000 value; tame hay, 303,000 acres, 483,000 tons, \$8,778,000, value; potatoes, 95,000 acres, 16,435,000 bushels, \$11,833,000, value; sweet potatoes 20,000 acres, 3,500,000 bushels, \$2,520,000, value; apples, 2,610,000 bushels; peaches 2,000,000 bushels, and pears, 405,000 bushels. At the beginning of 1923 the livestock on farms comprised 72,000 horses, valued at \$9,288,000; 6,000 mules, valued at \$786,000; 153,000 milch cows, valued at \$13,511,000; 32,000 other cattle, valued at \$1,242,000; 10,000 sheep, valued at \$75,000, and 132,000 swine, valued at \$2,310,000.

Manufactures.—The great manufacturing districts of New Jersey are located in the immediate vicinity of New York and Philadelphia. Within the limits of the city of Newark (q.v.) alone there are made a wider variety of articles than in any other city in the United States. Newark is famous for leather, jewelry, hats and celluloid, Paterson for silks and locomotives, Passaic for woolen and worsted goods, Jersey City for tobacco products and soap, Trenton for pottery of all grades, structural steel and iron and rubber goods, Camden for shipbuilding and chemicals, Elizabeth for sewing machines and shipbuilding, New Brunswick for hosiery, Perth Amboy and its vicinity for bricks and terra-cotta, Bridgeton, Millville, Vineland and smaller towns for glass. It should be noted here that the foregoing localized industries characterized the pre-war period. With the first shock of battles in Europe a very large number of industrial plants began engaging in the manufacture of war munitions

and after the United States entered the war every plant that could turn out any such products, irrespective of its original purpose, was rushed with war orders. A suggestion of this abnormal industrial activity is given in the article on the city of Newark. While much of the operations for the Entente Allies at first and for them and the United States later on was prudentially screened from the general public, it was no secret that many of the great manufacturing plants in the various cities of New Jersey were working incessantly to make the world safe and fit to live in. And among the many instances of most effective service in the State that rendered at the shipbuilding plant at Camden, where, on 5 May 1918, the steel naval collier *Tuckahoe* was launched just 27 working days after her keel plates were laid, is deserving of special mention.

A healthful development of the manufacturing interests of New Jersey is shown in a comparison of the United States census reports for the operating years 1909 and 1919. According to the census of the former year there were in the State 8,817 manufacturing plants having annual products exceeding \$500 in value and conducted on the factory system, which excludes small hand trades. These plants employed \$977,172,000 capital, an increase of \$499,870,000 in 10 years, and 371,265 persons; paid \$720,033,000 for materials used in manufacturing and \$218,046,000 for services and yielded products valued at \$1,145,529,000, an increase of \$592,523,000 in 10 years. The industries and products of largest values were smelting and refining copper, \$125,651,000; silk and silk goods, \$65,430,000; foundry and machine shop products, \$65,398,000; slaughtering and meat-packing, \$37,583,000; woolen, worsted and felt goods, \$33,939,000; and wire, leather, electrical supplies, tobacco, chemicals and malt liquors. The census of manufactures in 1919 yielded the following summaries: Plants, 11,057; operatives, 602,170; invested capital, \$2,815,577,127; paid for materials, \$2,270,473,279; paid for services, \$771,732,612; and value of products, \$3,672,064,987. In the period of 1914-19 the increase in the capital investment was 108.2 per cent and in the value of products, 161.1 per cent.

Oyster and Fish Industry.—Of the other industries outside those of an agricultural and manufacturing character, the oyster and fish industry is most conspicuous. From the mouth of the Raritan River to Sandy Hook, from Barnegat Bay to Cape May and thence in Delaware Bay to Salem, are about 15,000 acres of productive oyster beds. From the famous Maurice River oyster beds alone \$2,275,000 worth of these bivalves, have been shipped in a single year. From the Atlantic Ocean and Delaware Bay quantities of clams and fish are sent to nearby markets. Shad and sturgeon are caught in Delaware Bay and river.

Communications.—The State is well equipped with transportation facilities. In 1923 it was served by nine great railroad systems, operating on 2,461 miles of track, exclusive of switching and terminal mileage. Besides their main lines these systems operated a considerable number of small subsidiary lines. The main companies were the Pennsylvania; Delaware, Lackawanna and Western; Erie; Central of New Jersey; Lehigh Valley; Philadelphia and Reading; Baltimore and Ohio; West Shore,

Ontario and Western. The State was also entered by regular trains from New York City using the Pennsylvania and the Hudson and Manhattan tubes. In 1918, after the national government had taken over the railroad systems of the country, there was a rerouting of a number of roads operating in New Jersey to speed up war transportation necessities, a transfer of their regular lines being made to the Pennsylvania tunnels. Within the State are the two gateways, Jersey City and adjacent cities leading to Greater New York and Camden to Philadelphia. All the above companies have terminal facilities in Jersey City, Weehawken and Hoboken. Every railroad entering New York city from the west and south transports its passengers through New Jersey. There are nearly 1,000 miles of cable, electric and horse railroad in the State, a large percentage of the trackage being under the control of the Public Service Corporation. A continuous trolley service has been established between Jersey City and Camden, uniting Philadelphia and Greater New York. These roads have cost nearly \$150,000,000. In conjunction with the counties, townships and cities and assessments upon abutting property-owners, New Jersey has aided in the construction of upwards of 1,000 miles of good roads penetrating every section of the State and usable at all seasons of the year. In the apportionment of Federal funds to the States for the construction and maintenance of public roads, under the Act of Congress, approved 11 July 1916, New Jersey was allotted \$59,212.68 for the fiscal year ending 30 June 1917, increased to \$177,357.22 for the fiscal year ending 30 June 1919, which was the third allotment. Under the law, the several allotments are based (1) one-third in the ratio of area, (2) one-third in the ratio of population, and (3) one-third in the ratio of mileage of rural delivery and star routes. The Congressional appropriations were fixed at \$1,000,000, to be apportioned annually up to and including the fiscal year ending 30 June 1926. The canal systems of the State embrace the Delaware and Raritan, extending from Bordentown to New Brunswick, and the Morris, extending from Jersey City to Phillipsburg and uniting with the canal system of the Commonwealth of Pennsylvania. The total mileage is 173.34. The total valuation of railroad and canal property within the State for taxation was fixed at \$357,308,543 for the year 1917, and on this valuation \$5,754,337.59 was levied for State purposes and \$2,439,143.59 for local uses—a total of \$8,193,481.18, an increase in a year of \$715,061.06.

State Institutions.—New Jersey has a group of educational reformatory and eleemosynary institutions of which it may well be proud, especially as a number of them have served as models for other States. The State capitol is at Trenton, which was selected as the seat of government in 1790, and in its present form represents a number of additions. Trenton is also the seat of the State arsenal, State Hospital, a State Normal School, State Home for Girls, the State Prison and the State School for the Deaf. There are also a second State hospital at Morris Plains, State normal schools at Newark and Upper Montclair, a State Home for Boys at Jamesburg, a Home for Disabled Soldiers at Kearny, a

Home for Disabled Soldiers, Sailors or Marines and Their Wives at Vineland, a Home for the Care and Training of Feeble-Minded Women at Vineland, a Training School for Feeble-Minded Children at Vineland, a State Village for Epileptics at Skillman, a State Reformatory at Rahway, a State Tuberculous Sanitarium at Glen Gardner, a Manual Training and Industrial School for Colored Youth at Bordentown, a State Reformatory for Women at Clinton and a State Colony for Feeble-Minded Males at New Lisbon. Other functions assumed by the State include an Agricultural College and Experiment Station at New Brunswick, in connection with Rutgers College, teachers' institutes, school libraries, the preservation of fish, game and oysters, the care of the lives of employees in factories and workshops, an extensive geological survey, the preservation of historic sites, of the Palisades of the Hudson River and of public documents, and the removal of children from improper influences.

Seaside Resorts.—The diversified scenery and climate of the State has led to the establishment of many resorts in all parts of New Jersey. Along the sea coast, Cape May has been noted as such for about a century, to be soon followed by Long Branch. Atlantic City has reached an organized existence of over 70 years and represented in growth and attractiveness the most conspicuous example of municipal sea-shore development to be found in the world. Asbury Park and Ocean Grove were established about 1870. Within the last quarter of a century, practically every foot of beach-front from Sandy Hook to Cape May has been subjected to a greater or less degree of development. Schooley's Mountain was a popular summer resort fully a century ago. Budd's and Hopatcong lakes have also had a long life of prosperity; Greenwood Lake, partly in New Jersey and partly in New York, is widely noted as a summer residential and bungalow centre; and Lakehurst has become in recent years a well-known summer and all-year locality.

Education.—As early as 1662 a schoolmaster was settled among the Dutch landowners in what is now Jersey City; about 10 years later schools were erected in Newark, Woodbridge, Amboy, Elizabethtown, Freehold and Piscataway, while in 1683 the Society of Friends at Burlington set aside rents from an island in the Delaware for the purposes of public education. In 1817, after nearly 20 years' agitation, the legislature created the first school fund. The management of the schools of the State is vested in a State Board of Education appointed by the governor. This board appoints superintendents for each of the 21 counties of the State. Although the constitution requires that the State shall provide free instruction for all children between the ages of 5 and 18, the State has extended the age from 4 to 20. Courses in kindergarten and manual training have been extensively adopted, particularly in the large industrial centres.

In the school year 1921-22 the enrollment in the public schools was 678,734; the average daily attendance, 538,088; length of school year, 183 days; total number of teachers, 20,874; average monthly salary of teachers, \$128.20; estimated value of all property used for public school purposes, \$75,000,000; expenditures of

NEW JERSEY

1 Looking toward the Delaware Water Gap from Manunka Chunk

2 Falls of the Passaic, Paterson

the year for schools, \$60,160,331. There were 70 public and several private high schools; 3 public normal schools; and 7 universities, colleges and technological schools. The latter comprised Princeton University, at Princeton, opened in 1746; Rutgers College, at New Brunswick, opened in 1766; Seton Hall College, at South Orange, opened in 1856; Stevens Institute of Technology, at Hoboken, opened in 1871; Saint Peter's College, at Jersey City, opened in 1878; Upsala College, at Kenilworth, opened in 1893; and the College of Saint Elizabeth for Women, at Convent Station.

Of the many private schools in the State among the most conspicuous are Lawrenceville School (John C. Green Foundation), one of the most famous in the country, Princeton Preparatory School, Peddie Institute at Hightstown, Pennington Seminary, all in the county of Mercer. Other schools are Saint Mary's Hall in Burlington, the West Jersey Academy and South Jersey Institute at Bridgeton, Newark Academy, Hasbrouck Institute at Jersey City, Bordentown Military Academy, Blair Presbyterian Academy at Blairstown, Centenary Collegiate Institute at Hackettstown. There are theological institutions at New Brunswick, at Princeton, at Madison and at Newark.

Churches.—Throughout the colonial period of New Jersey three lines of religious activity were noticeable. In the eastern portion, the various phases of Calvinism were transplanted over-sea by the settlers. The Hollanders, the Scotch and many of the English emigrants, and the French Huguenots found a common bond of association in Calvinism. Ultimately Presbyterianism, outside of the sphere of Dutch influence, became dominant. In the western portion of the colony the Society of Friends held sway, with strength in Monmouth County, a part of the eastern portion. The Church of England never obtained a strong hold in the colony, its main congregations being at Burlington, Trenton, Perth Amboy, Elizabeth and Newark. During the middle part of the 18th century, Whitefield and Tennant, as Calvinists, and John Woolman, the apostle of the abolition movement in America, paved the way for future changes. Following the Revolution, the Methodist Episcopal Church, with its democratic teachings, recruited largely from the Society of Friends and from many of the Presbyterian congregations. With the coming of the Irish and German emigrants into New Jersey, in the period of extension of transportation systems (1830-60), the Roman Catholic Church made great advance.

In 1916, the United States Census Bureau, reporting the religious statistics of the country that year, credited New Jersey with 3,000 religious organizations, having together 1,337,983 communicants, about 3,000 church edifices, church property valued at \$90,000,000 and 3,000 Sunday schools, with 50,000 officers and teachers and over 400,000 scholars. The strongest denominations numerically were the Roman Catholic, 790,764; Methodist Episcopal, 131,211; Presbyterian (U. S. A.), 102,290; Baptist (U. and Nat. Con.) 80,918; Protestant Episcopal, 67,996; Reformed (in America), 38,772; Lutheran (Gen. Coun.), 19,680, and Congregationalist, 10,839.

Banks and Banking.—The State legislature granted charters to two banks, one in Newark and one in Trenton in 1804. In 1812 a general

banking law was passed for the protection of depositors, the law remaining in force until 1850, when other laws were passed. The legislature established a department of banks and insurance in 1891 and the banking law was again revised in 1899. Since 1880 New Jersey has been a favorite State for trust companies and for the organization of large corporations. Savings banks were first established in 1828. In 1876 a law was passed regulating these institutions.

In 1913 Congress passed a National Banking Act and constituted a Federal Reserve Board which divided the country into 12 districts. The act made it obligatory on all National banks and permissible for all State banks and trust companies to acquire membership in the new organization. Under this act New Jersey was divided into two parts, all of the State north of Trenton being assigned to Federal Reserve District No. 2, of which New York is the central reserve city, and the rest of the State to District No. 3, of which Philadelphia is the central reserve city. The following is a summary of all national banks in New Jersey reporting under the act of Congress, 15 Sept. 1922; number of banks, 228; capital stock, \$29,762,000; total assets, \$623,002,000; surplus, \$28,063,000; total deposits, \$523,447,000. The State banks numbered 27 with aggregate resources of \$57,335,000; capital stock of \$2,950,000; surplus, \$2,190,000; individual deposits, including unpaid dividends and postal savings, \$47,853,000. Trust companies numbered 135, with resources and liabilities aggregating \$666,038,000.

In 1916 Congress passed an act providing for the establishment of a Federal Land Bank System for the special benefit of the agricultural portions of the country. The act divided the country into 12 districts, each with an executive centre. New Jersey, under this act, was apportioned to District No. 1, of which Springfield, Mass., was made the centre, and up to 31 Oct. 1917, loans had been applied for in the State to the amount of \$604,745. The mutual savings banks in the State on 30 June 1922 held \$185,111,000 in deposits to the credit of about 361,000 depositors, and one stock savings bank held \$21,118,000 in deposits for about 40,000 depositors.

Finances.—The finances of the State are in most excellent condition. The bonded debt amounts to \$22,000,000 for which interest and a sinking fund are provided. There is no State tax levied. The financial receipts of the State are largely derived from the tax on railroads and miscellaneous corporations which pay a large share of the total revenue. These figures show a steady increase in wealth and material prosperity. Other important sources of revenue are State fees from the officers of the clerks in Chancery and Supreme Courts, the collateral inheritance tax, from the office of commissioner of banking and insurance, from the office of secretary of state, from the State Prison and State Reformatory and from the oyster commission.

The net valuation for taxation of real and personal property listed by local assessors and county boards of taxation in 1922 was \$3,797,507,447, an increase in a year of \$277,666,178. The net valuation did not include bank and trust company stock, which was separately assessed at three-fourths of 1 per cent. and for 1922 was taxed at approximately \$110,000,000.

Population.—New Jersey began to obtain rapid growth in population about the year 1840; the absolute increase being the greatest in the decade from 1890 to 1900, due largely to the immigration of foreigners and the suburban New York population. The growth of population is given by the Federal government census as follows: (1790) 184,139; (1820) 277,426; (1850) 489,555; (1860) 672,035; (1870) 906,096; (1880) 1,131,116; (1890) 1,444,933; (1900) 1,883,669; (1910) 2,537,167; (1920, Federal census) 3,155,900.

Following is a list of the counties in New Jersey with their population for 1900, 1910 and 1920:

COUNTY	Square Miles	1900	1910	1920

Government.—The general government of the State is administered under a constitution adopted by the people in 1844, and amended by special elections in 1875 and 1897. Amendments to become a law, or a part of the constitution, must receive the approval of the majority of the members of two consecutively chosen legislatures of the State, and must then be submitted to the people. A majority vote of the electors of the State is necessary for adoption. Five years is the time that must elapse between the submission of amendments to the people. Duly qualified voters are all citizens who have resided in the State one year, and in the county five months. The law requires the registration of voters. State elections are held annually on the Tuesday after the first Monday in November. In 1923 the State had 12 representatives in the Lower House of Congress.

Legislature.—There are 21 State senators composing the upper house of the legislature, one from each county, and the term of office is

three years. There are 60 members of the house of representatives, elected from the counties on the basis of population. The term of office of a member of the lower house is one year. The compensation of both senators and representatives is \$500 per annum. The legislature meets annually without limit of session. Revenue bills originate in the lower house.

Executive.—The governor is chosen by popular vote and for a term of three years; compensation \$10,000. He cannot be re-elected without an intervening three years. He has power to call extra sessions of the legislature, or of the senate without the representatives. He has the usual veto power which may be overruled by a majority vote of all the members of the legislature. He grants pardons and reprieves in conjunction with the chancellor and six judges of Errors and Appeals. The State treasurer and comptroller are appointed for three years at a joint session of the legislature. The governor, subject to the approval of the senate, appoints for terms of five years the secretary of state, attorney-general, clerk of Supreme Court, clerk of the Court of Chancery, and keeper of the State prison.

Judiciary.—The constitution vests the judicial authority of the State in a Court of Errors and Appeals in the last resort of all causes; a Court for the Trial of Impeachments; a Court of Chancery; a Prerogative Court; a Supreme Court; Circuit Courts; and such inferior courts as may be established by law. The Court of Appeals consists of the chancellor, the justices of the Supreme Court and six judges, or a major part of them, appointed for six years. The lower house of the legislature has the sole power of impeaching, and the upper house tries all impeachments. The Court of Chancery consists of the chancellor and normally eight vice-chancellors. The Supreme Court consists of a chief justice and eight associate justices. Circuit Courts are held in every county, with eight judges in all. There are also 26 District Courts. The Special Court of Pardons consists of the governor, chancellor and lay judges of the Court of Errors and Appeals.

Local Government.—The counties and towns are governed under general laws, and special laws cannot be passed unless by amendment of the constitution. The justices of the peace are elected for five years by vote of the electors of the townships. The counties elect surrogates and clerks for terms of five years. The counties elect, also, sheriffs and coroners for three years, but such officers cannot be re-elected without an intervening three years. The cities and townships are required to have local boards of health. Within the past decade the commission form of government had been adopted by popular vote in many cities and towns including: Atlantic City, Bayonne, Belleville, Beverly, Bordentown, Haddonfield, Hawthorn, Hoboken, Irvington, Jersey City, Long Branch, Millville, Newark, New Brunswick, Nutley, Ocean City, Orange, Passaic, Phillipsburg, Rahway, Ridgefield Park, Ridgewood, Trenton, Vineland, and Wallington.

History.—Based upon the conclusions reached by a group of scientists of international reputation, it may be stated that Man, known as "Glacial," "Argellite," and "Palæo-

lithic,⁹ resided within the limits of New Jersey, at the close of the Age of Ice. The proofs offered are the presence of non-intrusive stone implements, remains of extinct quadrupeds, used by primitive man as food, and human skulls and bones, all of which have been found in and near the city of Trenton. At this point, a large deposit of river wash, particularly sand and gravel, indicates that at one time the mouth of the Delaware River was directly south of Trenton. In the river wash the above mentioned evidences of human occupancy have been found. The culture point attained by these earliest inhabitants was probably that reached by Man in the Stone Age in Europe.

The Indians whom the Dutch and Swedes found in New Jersey were known as the Lenni-Lenapé, members of the great Algonquin family. They were comparatively few in number, scattered in shifting communities along the river valleys and the sea coast. Less warlike than the Indians of New England or of Virginia, the Lenni-Lenapé, later known as the Delawares, made some progress in agriculture and in the elementary arts. With the Dutch and Swedes, the Indians maintained comparatively peaceful relations, although a traders and settlers' war in the Raritan Valley, before the coming of the English, is a matter of record. After the English conquest of 1664, the Indian, although kindly treated by the Society of Friends in West Jersey, and tolerated by the Calvinists in East Jersey, could not withstand the effects of European civilization. Consumption, smallpox, venereal diseases, and alcoholism drove him down to the depths. Distrustful of the efforts made by the missionaries, his personal liberty restrained by legislation and social custom, the Indian was enslaved, and by intermarriage with the negro, lost his identity. In 1758, most of the New Jersey Indians were removed to the first reservation ever established within the limits of the present United States—that located at Edgepelick, Brotherton or Indian Mills in the "Pines" of Burlington County. At the opening of the 19th century the Indians were removed to New York, and thence after various wanderings to Indian Territory. Lenni-Lenapé of the full blood are now extinct in New Jersey.

Holland, politically and religiously free, and struggling with Sweden for supremacy as a world power, located upon Manhattan Island, her principal fort and trading post in the New World. Her navigators explored the coasts of New Jersey, and to one of the great rivers, the North, was given the name of Hudson. Cornelius Jacobsen Mëy sailed up the Delaware, then known as the South River, and commemorated himself by the name Cape May. By discovery and occupancy Holland laid claim to the soil of New Jersey. From New Amsterdam, farmers and traders established themselves in what is now Hudson and Bergen counties. By 1650 colonist had penetrated the river valleys emptying into all the waters of the Greater New York Harbor. Settlements were attempted on the Delaware. The efforts of the Dutch, in the colonization of New Jersey, were only successful in the northeastern portion of the State, where the church, speech and lines of political thought of the fatherland firmly impressed themselves upon the community until recent years.

Gustavus Adolphus, in his scheme of Swedish colonization for North America, utterly disregarded the presence of the Dutch in New Jersey. For about 15 years after 1640, several groups of Swedish settlers occupied the valley of the Delaware, locating principally in the vicinity of Philadelphia. The communities of Swedes in New Jersey, isolated and neglected by the home government and harassed by the Dutch, finally submitted, with their associates in Pennsylvania and Delaware, to the domination of Holland. From 1655 to 1664, New Jersey remained under the absolute control of Holland.

Recognizing the fact that Dutch control of the valleys of the Hudson and the Delaware separated New England from the southern colonies, Charles II, king of England, granted to his brother, James, Duke of York, a vast domain in North America, including much of what is now New England, New York and New Jersey. An English naval expedition, in the summer of 1664, sent to New Amsterdam, secured the capitulation of the Dutch. To John, Lord Berkeley and Sir George Carteret, two faithful adherents of the House of Stuart during the Protectorate, the Duke of York made a transfer of what is practically the territory of New Jersey.

In recognition of Carteret's defense of the island of Jersey, against the Cromwellian forces, the Berkeley-Carteret grant was called New Jersey. The policy of the proprietors was to attract settlement, which was accomplished by exploiting the natural advantages of the colony, granting a liberal frame of government and providing for allotments of free or low-priced land. There was a very pronounced New England movement into the valleys of the Passaic and smaller streams, and by the introduction of social, political and religious views of the Congregationalists, the eastern portion of the colony became a partial reproduction of New England itself. Within a few years Berkeley disposed of his interests to a company largely composed of members of the Society of Friends. A partition being desirable, a line was run from Little Egg Harbor to a point near the Delaware Water Gap. Henceforth, after 1676, begins the political history of East and West Jersey. To Carteret fell East Jersey; while West Jersey became the property of the members of the Society of Friends. After 1676, the western portion of the State was open to English settlement, the dominant spirit being William Penn. The communities established in the Delaware River valley were isolated, and a plantation life, not unlike that of Virginia and Maryland, lacking certain religious characteristics, was developed. The county in West Jersey became the political unit, as the town became the political unit in East Jersey. Both the Jerseys passed later under the domination of Boards of Proprietors, who exercised broad governmental powers, and, until the present, held title to unoccupied lands. From 1664 to 1702, when both boards relinquished governmental rights to the Crown, there was a constant spirit of popular unrest, and one complete and one attempted change in government. In 1673 New Jersey was recaptured and occupied for a few months by the Dutch. When James, Duke of York, became King James II, he endeavored, by means of Sir Edmund Andros, to upset the proprietary gov-

ernments, the matter not being finally settled, favorably to the proprietors, until 1681. In the meantime, internal disturbances growing out of quit-rent agitations, affected the peace of the two proprietaries. The period from 1702 to the outbreak of the American Revolution was undisturbed by any dramatic incidents. The growth of Philadelphia and New York, as commercial centres, tended to develop the agricultural interests of New Jersey. As early as 1710 the tendency to draw the active forces of the colony into the two cities was apparent, leading to Benjamin Franklin's famous aphorism, uttered soon thereafter, that New Jersey was like a cider barrel, tapped at both ends. The usual colonial quarrels between the Crown officers and the popular branch of the legislature were reflected in New Jersey, as elsewhere. Landed interests dominated the governor's council, small property owners were disfranchised, business enterprises were restricted, if not prohibited, by legislation in Parliament, and by taxation, commerce on the high seas was suppressed by the navigation acts, metallic currency was withdrawn from the colony,—a score of causes, mainly economic, operated to produce the resort to arms.

While loyal to the Crown, there were, nevertheless, mutterings of discontent, of ill-concealed defiance of law officers and a spirit of restlessness, restrained by the wave of patriotism evoked by the French and Indian war, but which swept on with increasing force after the opening of the year 1770. The most notable events of this period, from 1702 to 1775, were the suppression of piracy in the vicinity of New York and Cape May; the establishment of a continuous land and water route from Philadelphia and New York; the erection of ferries and post roads; the appearance in the northern, central and western parts of the colony, of Huguenot, Scotch-Irish and Palatinate emigrants; the chartering of Princeton University and Rutgers College; the establishment of the first Indian reservation in the United States in Burlington County, the religious revival of George Whitefield, and the promulgation of John Woolman's abolition doctrine; the massacres by the Indians in Sussex County, and the erection of a series of barracks, owing to their need in the French and Indian war, in various parts of the State. The opening of the American Revolution found New Jersey divided in sentiment. The Calvinistic element, represented so largely in East Jersey, took the initiative. The spirit of war, as in New England, appeared in the town meeting. The professional classes, the members of the Society of Friends and the large merchants were either opposed to war or were non-combatants. A minority awaited the results of agitation. The strength of the element loyal to the home government may be shown from the fact that upon 2 July 1776, when New Jersey asserted her statehood, the constitution contained a proviso that the document should not be operative in case of a reconciliation between England and New Jersey. William Franklin, the last colonial governor of New Jersey, remained loyal to the Crown, and, banished from New Jersey, sought refuge among Tory sympathizers in New York City, becoming the adviser of those planning movements of Tory invaders in the State. Largely conducted in the northern central portion of New Jersey, under the control of Crown

sympathizers, these raiders gained the name of "Pine Robbers." During the Revolution, nearly 100 battles and skirmishes were fought upon the soil of the State. Most conspicuous were the battles of Trenton (26 Dec. 1776), Princeton (3 Jan. 1777), Red Bank (22 Oct. 1777), Monmouth (28 June 1778), and Paulus Hook (19 Aug. 1779). Among minor engagements of importance were the fights at Bound Brook (13 April 1777), Egg Harbor (15 Oct. 1778), Hancock's Bridge (21 March 1778), Tom's River (24 March 1782), the burning of Bordentown (8 May 1778), and no less than a score of engagements in and around Elizabeth and Newark and nearby territory. During the war occurred the "retreat across the Jerseys" and Washington's two winter occupations of Morristown. At the close of the war, New Jersey was sadly impoverished. Her spirit was distinctively Federal. She participated in the Annapolis Convention, her representatives advocated the "New Jersey plan" at Philadelphia, in the framing of the Federal Constitution, which she adopted without a dissenting voice. With the opening of the 19th century, New Jersey became a political storm-centre. As a Federalist leader, Alexander Hamilton had wielded a powerful influence in the State. He had been active in the establishment of the Society for the Improvement of Useful Manufactures, out of which grew the city of Paterson, and had urged the development of Paulus Hook (the site of Jersey City). He was closely allied with the Federal elements until then in control of New Jersey politics. Arrayed against him was Aaron Burr, son of the Rev. Aaron Burr, sometime president of the College of New Jersey, now Princeton University. The end of the antagonism between Burr and Hamilton came in a duel fought in 1804, at Weehawken, N. J. The activities in politics were reflected in industrial life. Before the second war with England, a chain of State banks was established, bridges crossed the rivers between Philadelphia and New York, steamboats were to be found upon the Delaware and Hudson rivers, highways were extended to every accessible part of the State, and the development of water power led to the establishment of many small factories. The second war with England blighted the prospects of growth. Although no engagements occurred upon her soil, New Jersey, as much for the protection of Philadelphia and New York, as for her own interest, furnished militia to garrison forts on the Delaware and at Sandy Hook. The position of the State led to overland transportation of military supplies between the North and South, for the reason that the Atlantic seaboard was blockaded by British fleets. From this condition and owing to the demand for good roads, the first railroad charter ever granted in the United States passed the legislature in the year 1815. This, in connection with the revival of agitation concerning internal waterways, led to the constructing of the Camden and Amboy Railroad and the Delaware and Raritan Canal, now a part of the standard lines of the Pennsylvania Railroad system across the State of New Jersey.

The development of the industrial era, following the close of the War of 1812, broken by the panics of 1817, 1837 and 1857, marked the growth of Newark, Jersey City, Paterson, Eliza-

beth, New Brunswick, Trenton and Camden. The period of social unrest characteristic of Jacksonian dominance in politics led to the adoption of a new State constitution in 1844, pronounced reforms of a penalogical and charitable character, the extension of the public school system and the growth of railroads. The Civil War found New Jersey ready to respond to the call for troops. To the cause of the Union she

furnished 88,305 men, or within 10,501 of her entire militia, and for the organization, subsisting, supplying, supporting and transporting her troops she paid nearly \$3,000,000. Following the war came a period of prosperity. The agri-

cultural advantages of the southern portion of the State, first practically promoted at Vineland and latterly fully disclosed by the success of the Jewish settlement at Woodbine, revolutionized a large area south of Camden. The overplus of population of Philadelphia and New York sought permanent and temporary homes in New Jersey, while the industrial centres of the northern and eastern portions of the State grew with unprecedented rapidity. The present prosperity of the State is largely due to the changes which have occurred in the last three decades.

Woman suffrage was permitted under the original constitution until 1807, when the legislature restricted the suffrage to white male citizens. School suffrage was granted to women in 1887; a full suffrage amendment to the constitution was defeated in a popular election in 1914; and a presidential suffrage bill was introduced in the senate, referred to the judiciary committee and reported unfavorably in 1916. Local option on the liquor traffic was permitted, with fees ranging from \$100 to \$1,000. Prohibitionists were unusually active in 1917-18, and several large communities voted "dry." A new election law substitutes a blanket ballot for separate party ballots; voting machines have been discarded; a very rigid employer's liability law has been recently enacted; grand and petit juries are now drawn by a chancellor's commissioner and the sheriff of the county; the corrupt practices act has been amended with greater severity than before and juries may now recommend life imprisonment for first-degree murder instead of the death penalty as before.

After the United States entered the World War the rail and water advantages of its location quickly attracted the attention of the National government to the constructive opportunities that New Jersey afforded. Large areas of the Hackensack meadows and the meadow land in the southern suburb of Newark were speedily acquired for extensive industrial plants. Great ship-building operations were undertaken in both sections; the shipyards at Camden were taken over, and the waters of Newark and Delaware bays and the Passaic and Hackensack rivers soon became the scenes of intensive war activities. A great army cantonment, Camp Dix, was established at Wrightstown, and an embarkation camp at Dumont, N. J., was quickly doing its "bit" in grand fashion.

FRANCIS B. LEE,

Editor-in-Chief of 'New Jersey as a Colony and as a State'; Revised by GEORGE J. HAGAR, New Jersey Historical Society.

NEW JERSEY, College of. See PRINCETON UNIVERSITY.

NEW JERSEY FOREIGNERS, in *American humor*, an allusion to New Jersey as a foreign country, and to New Jerseymen as foreigners; a saying handed down from the time when Joseph Bonaparte, ex-king of Spain and Naples, after the downfall of Napoleon, sought an asylum in the United States. As an alien he was obliged to obtain a special act of legislature to enable him to hold real estate. Pennsylvania refused, but New Jersey consented, and he established himself in princely magnificence at Bordentown. Hence men of other States used to declare that the Jersey-men, with their foreign prince, were foreigners.

NEW JERSEY PLAN, in *American history*, a plan for a Federal Constitution proposed at the Convention of 1787 by William Paterson (q.v.), of New Jersey. The resolution provided for the enlargement and correction of the Articles of Confederation; that Congress should remain a single body, and should regulate taxation and commerce, and should choose the executive; that requisitions from States should be continued; that a judiciary should be established; that naturalization should be uniform; that the executive should coerce refractory States or individuals; and other provisions of less importance. This plan was unfavorably reported from the committee to whom it was referred; but a compromise was ultimately effected.

NEW JERSEY TEA. See CEANOTHUS.

NEW JERUSALEM, the name given by the Apostle John in the book of Revelation to heaven.

NEW KENSINGTON, Pa., the centre of a tri-borough composed of New Kensington, Parnassus and Arnold, in Westmoreland County, located on the Alleghany River and on the Pennsylvania Railroad, 18 miles northeast of Pittsburgh. It is described as "The Queen City of Westmoreland County," "The Metropolis of the Allegheny Valley," and industrially is known as the home of aluminum, having the largest aluminum mill in the United States. There are also two mills of the American Sheet and Tin Plate Company, the American Window Glass Company, one of the largest plants in the country, two large railway equipment plants, besides a number of other important industries exploiting the mineral and other wealth of the neighborhood, with an output of steel and iron manufactures, brick, white lead, lumber, furniture, etc. The borough is distinguished by its imposing public buildings, handsome residential sections, fine schools, churches and benevolent institutions. The borough celebrated its

silver jubilee of 25 years of prosperity in 1916. Pop. (1920) 11,984.

NEW LEBANON, N. Y., town in Columbia County, 24 miles southeast of Albany, on the Rutland Railroad. The people are engaged in agriculture and manufacturing, the products being patent medicines, brooms, chairs, baskets, lumber and flour. Nearby are fine thermal springs around which a popular resort has grown called Lebanon Springs. Another adjacent settlement is the Shaker village, Mount Lebanon.

NEW LEINSTER, lēn'ster, or līn'ster. See STEWART ISLAND.

NEW LEXINGTON, Ohio, village, county-seat of Perry County, on the Pennsylvania and the Toledo and Ohio Central railroads, about 50 miles east by south of Columbus. It is in an agricultural section and in the vicinity are coal fields and deposits of fire clay and natural gas. The manufactures are chiefly brick and other clay products. There is considerable trade in farm products, brick, clay and coal. It is the seat of Saint Aloysius Academy. The waterworks are municipally owned and operated. Pop. (1920) 3,157.

NEW LIGHT, a fish. See CRAPPIE.

NEW LIGHT and OLD LIGHT, the names generally used to designate the two parties in the Presbyterian Church whose difference of opinion in regard to the power of the civil magistrate in matters of religion caused the disruption of the Associate Synods of Scotland in the latter part of the 18th and the beginning of the 19th centuries. The terms were again used for the two parties in the similar controversy in the Reformed Presbyterian Church in the United States which caused the division of that body in 1833. See PRESBYTERIAN CHURCH IN THE UNITED STATES.

NEW LISBON, or LISBON, Ohio. See LISBON.

NEW LISKEARD; līs'kārd, Canada, town in Ontario, at the head of Lake Timiskaming and five miles north of Haileybury, on the Timiskaming and Northern Ontario Railroad. It is a growing town with a public library, hospital, foundries, saw-mills, grist-mills and brick-yards. It is provided with an electrical lighting system and waterworks. Pop. 3,000.

NEW LONDON, Conn., city, port of entry, one of the county-seats of New London County, on the Thames River and on the Central Vermont and the New York, New Haven and Hartford railroads, about three miles from Long Island Sound and 50 miles in direct line southeast of Hartford. It has regular steamer connection with New York, with Greenport and Sag Harbor on Long Island and, in the summer, with Block Island. A State-owned pier, for which the State appropriated \$1,000,000 has greatly increased the facility of its fine harbor. When contemplated improvements are completed, vessels of 37-foot draft can be accommodated.

In 1646 John Winthrop, the younger, founded Naumag, and in 1658 the name was changed to New London. Prior to the Revolution it was of considerable commercial importance and had established trade with the coast towns of the nearby colonies and with the West

Indies. During the war it suffered from attacks by the British. On 6 Sept. 1781 a British force under command of Benedict Arnold attacked the town, destroyed the wharves and many of the buildings and killed a number of people. The principal battle occurred across the river on Groton Heights. In memory of this attack, a shaft 127 feet high has been erected at the place (see GROTON) where the massacre occurred. The town was incorporated in 1784. The first session of the Catholic Summer School of America (q.v.) was held in New London.

New London has a number of large manufacturing establishments, chief of which are machine shops, foundries, printing-press works, silk-mills, cotton-gin factory, brass and copper tube works, bedquilt factory and shipyards, submarine engine works, large, new Groton shipyards. Some of the historic places of interest are the Old Town mill, built in 1646, the schoolhouse where Nathan Hale was once a teacher, and the Hempstead House, Old Fort Griswold, George Washington House. A government naval station is on the other side of the river now an important base for submarines. New London is the seat of the Internal Revenue Cutter School of Instruction located at Old Fort Trumbull. Also the seat of Connecticut College for Women opened for students in 1915. New London and vicinity is an important summer resort, several thousand visitors being added to its population during the season. It has beautiful country roads for autoing and is also the centre of the Connecticut lobstering and fishing industries. The annual boat race between Harvard and Yale universities occurs on the Thames in June. It has a vocational high school, public and parish schools, the New London County Historical Society and Library and a public library. The government is administered under a charter of 1894, revised in 1905, which provides for a mayor who holds office three years and a council. The school board is chosen by popular vote. Pop. (1900) 17,548; (1910) 19,659; (1920) 25,688. Consult 'Historic New London' (in *New England Magazine*, Vol. V); Caulkins, 'History of New London'; Starr, 'Centennial Sketch of New London.'

NEW LONDON, Wis., town in Waupaca County, 20 miles north of Appleton on the Wolf River and on the Chicago and Northwestern and the Green Bay and Western railroads. It has an electric-light plant, waterworks, a Carnegie library, school buildings and an attractive city hall. New London manufactures bee-hives, furniture and machinery. It also has a condensed-milk plant and lumber mills. Pop. (1920) 4,667.

NEW MADRID, Mo., city, county-seat of New Madrid County, on the Mississippi River and on the Saint Louis Southwestern Railroad, about 130 miles in direct line south by east of Saint Louis and about 50 miles below Cairo, Ill. It has regular steamboat connection with all the river ports. It was settled by Americans in 1788, when the Spanish owned east of the Mississippi. During the Civil War it was used as a Confederate station until 14 March 1862, when it was abandoned and became a Federal possession. It is situated in a productive agricultural region in which the principal crops are cotton, grain and fruit. Stock-raising is also important. It has extensive lumber interests.

The trade is chiefly in lumber, staves, veneer, grain, fruit, livestock and cotton. Pop. 1,908.

NEW MARKET, Battle of. In co-operation with General Grant's Wilderness campaign and the movements of General Crook, who was marching from West Virginia on Staunton, Va., General Sigel, commanding the Union forces in the Shenandoah Valley, on 9 May 1864, marched from Martinsburg up the Valley pike with General Sullivan's infantry, General Stahel's cavalry and five batteries of artillery, in all about 6,500 men and 28 guns. He arrived at Woodstock on the 11th, his cavalry pushing on to Mount Jackson, where, on the 14th, it encountered some of Imboden's cavalry, forced it across the Shenandoah, and followed as far as New Market. Colonel Moor, with parts of Sullivan's division and cavalry, joined the advanced cavalry at New Market late in the evening, and a skirmish ensued, in which artillery was used. Twice during the night strong demonstrations were made on Moor, which he repulsed. General Breckinridge, commanding the Confederate troops in the valley, hearing of Sigel's advance, had collected at Staunton a force of 5,000 men, including the cadets of the Virginia Military Institute, with eight guns, and at daylight of the 15th drew up two miles south of New Market to give battle. Moor had, besides 300 cavalry and two guns, two regiments of his own brigade and two of Colonel Thoburn's. Stahel came up in the morning and took command, and as it neared noon Sigel arrived with the rest of his army, and made disposition for battle. Moor was left in his advanced position, with his own two regiments and a small body of cavalry to hold Breckinridge in check, until Sigel could complete his dispositions, which were well made. Thoburn's brigade constituted the main line, along which were the batteries. The cavalry was behind the centre and on the left flank. The line extended across the pike on rising ground, another slope in front being held by Moor. Breckinridge formed line with Echols' brigade on the right and Wharton's on the left, the Institute Cadets and the 62d Virginia between the two. Imboden's cavalry and a six-gun battery were on the extreme right. McLaughlin's artillery occupied a sharp ridge left of and parallel to the pike and opened furiously upon Sigel's guns, which as furiously responded. Breckinridge advanced, and Moor, being overlapped on both flanks, fell back in some disorder, and Breckinridge, without pausing, pressed on and attacked Thoburn, who, charging from his right, checked him, Sigel's guns using shell and canister with great effect. Meanwhile Imboden crossed Smith's Creek and, moving down its east bank, gained the top of a small hill opposite Sigel's left, placed his guns on it, and at short range opened a rapid fire upon Sigel's massed cavalry, which immediately fell back, and Sigel ordered his entire line to fall back half a mile. Imboden's guns were now turned on the flank of the infantry, Breckinridge pressed on in front, and the contest was desperate and at close quarters, Von Kleiser's battery being particularly destructive to the centre of Breckinridge's line held by the Cadets. An order to charge the battery was given, the Cadets and the 62d Virginia went forward in fine style, and with great loss captured the battery; the rest of the line advanced,

and Sigel retreated, followed a short distance by Breckinridge. At Rude's Hill, nearly three miles from the field, Sigel halted and formed line; Breckinridge soon came up; there was an exchange of artillery firing; and at 7 P.M. Sigel abandoned Rude's Hill, crossed the Shenandoah, burned the bridge, and continued his retreat down the valley to Cedar Creek, which was reached early in the morning of the 17th. The Union loss was 93 killed, 482 wounded and 256 missing. The Confederate loss was 42 killed, 484 wounded and 13 missing. Consult 'Official Records' (Vol. XXXVII); Pond, 'The Shenandoah Valley in 1864' (New York 1883); The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV); Wise, 'The Battle of New Market.'

E. A. CARMAN.

NEW MECKLENBURG, mēk'lēn-bērg, formerly NEW IRELAND, the second largest island of the Bismarck Archipelago (q.v.), 35 miles northeast of New Guinea and to the northeast of New Pomerania, from which it is separated by Saint George Channel. It has an estimated area of nearly 5,000 square miles; is mountainous and forested, with a fertile coastal belt; with the exception of a small European trading station on the north coast it is inhabited by wild Papuan tribes.

NEW MEXICO, the 47th State admitted to the Union (1912), lies between lat. 31° 20' and 37° N. and long. 103° and 109° 2' W. It is bounded on the north by Colorado, on the east by Oklahoma and Texas, on the south by Texas and Mexico, and on the west by Arizona. Area, 122,271 square miles (78,374,400 acres), of which one-third is public lands. The territory was organized 25 Nov. 1850, under act of 9 Sept. 1850. Capital, Santa Fé.

Political Divisions.—The following table gives the counties, with their area, property assessment, population and county-seats:

Topography.—New Mexico occupies a lofty plateau which reaches its greatest elevation in the north and west and slopes to the south and to the southeast, where lies the western part of the Llano Estacado, or staked plain, no part of the plateau being less than 3,000 feet above sea-level. The altitude of Santa Fé, in the north, is 6,998 feet, that of Albuquerque on the Rio Grande, near the middle of the State, 5,008 feet, while Carlsbad (formerly Eddy), on the Rio Pecos, is 3,122 feet. From the vast table-land, both east and west of the Rio Grande, rise numerous sierras and more or less isolated peaks belonging to the Rocky Mountain system. The Sangre de Cristo range of Colorado extends southward into New Mexico to lat. 35° 30', the various component ridges being the Culebra, Cimarron, Taos, Santa Fé, Mora, Las Vegas, Raton, etc. The principal peaks are Cerro Blanco (14,269), Truchas (13,150), Taos (13,145), Costilla (12,634), Baldy (12,623), Lake (12,380) and Mora (12,020). Southward from these and extending eastward are numerous isolated sierras—the Sandia, Manzano, Gallinas, Jicarilla, Caballo, Oscuro, San Andres, Organ, Blanca, Capitan, Sacramento, Hueco, Guadalupe and many lesser mountains. West of the Rio Grande and within its immediate drainage is another broken sierra, extending southward from the Colorado line, its principal component groups being the Petaca, Valles, Gallinas, Nacimiento, Jemez, San Mateo, Magdalena, Socorro, Black, Mimbres, Florida and Potrillo mountains. In the northwest the Carrizo, Tunicha and Choiska mountains, forming part of the continental divide, extend into the State from Arizona, as do the San Francisco and Peloncillo ranges in the southwest; while lying between the western boundary and the mountains of the Rio Grande area are the Zúñi, Datil, Little Diablo, Black, Tularosa,

Mogollon, Pinos, Burro, Pyramid, Big Hatchet, Hacheta and Animas ranges, with many others of lesser note. See BOUNDARIES OF THE UNITED STATES.

Climate.—The climate is very dry and healthful, and has made the State justly celebrated as a resort for those afflicted with pulmonary troubles. The annual mean temperature ranges from 42.4° at Winsors, San Miguel County (8,000 feet), to 65° at Carlsbad, Eddy County (3,122 feet). The highest temperature averages approximately 112° at Carlsbad (25 June), and the lowest—12° at Bluewater, Valencia County (2 Feb.). The total precipitation on the average ranges from 22.42 inches at Carlsbad, to 4.66 inches at Deming, Luna County. Nearly half the precipitation (10.5 inches) at Carlsbad occurred in July. The greatest rainfall occurs between May and August, the least between February and April. The number of rainy days on the average ranges from 78 at Santa Fé to 18 at Albuquerque; average, about 40 days. The prevailing winds are southwest, west, southeast and east. Although the summer temperature is sometimes high, especially in the southern part, owing to the dryness of the atmosphere the heat is never oppressive and the nights are always cool.

Rivers.—The streams of northeastern, eastern and central New Mexico flow into the Mississippi and the Gulf of Mexico, while those of the western portion empty into the Gulf of California. The largest river is the Rio Grande, which flows generally southwesterly from the Colorado boundary to lat. 33°, then southeasterly across the Mexican line. This river has several unimportant tributaries within the State—the Chama, Jemez and Rio Puerco from the west and several of even less significance from the east. The Pecos has its source in the Las Vegas Mountains, flows southeasterly, then generally southward, almost paralleling the western escarpment of the staked plain, and southeasterly across the Texas border, finally joining the Rio Grande. The Canadian, with its several headstreams, drains northeastern New Mexico and passes out of the State in lat. 35° 25', forming a branch of the Arkansas. The western part is drained entirely by headwaters of the Colorado—the San Juan, the Zúñi and the Gila. The Rio Mimbres, which heads in the Florida Mountains, is, like all except the largest streams, non-perennial, and indeed even the channel of the lower Rio Grande is frequently dry.

Forests.—Several of the mountain ranges, particularly those of the north and in Lincoln and western Socorro, Grant and McKinley counties, are covered with timber, the most valuable being pine, although oak, juniper, cedar, birch, maple and other trees are common. The Pecos River, Lincoln and Gila River forest areas have been reserved by the United States, but grazing of cattle is allowed under certain conditions. Piñon and cedar are abundant in the foot-hills throughout the State; mesquite is found in the southeastern part, east of the Pecos, while the saguaro or giant cactus forms a feature of the landscape in the southern and southwestern parts, where there are also groves of oak and walnut. Along all the water-courses cottonwoods are abundant, and occa-

sionally willows and sycamores are found. Yucca, the roots of which are used as a substitute for soap, is everywhere abundant.

Agriculture.—In many of the valleys and mountain ranges (where the latter are not of exposed basalt are nutritious grasses—at least 14 varieties, mostly gramma, being found—affording fairly abundant food for the large flocks and herds. Bear, deer, mountain lions, wildcats and antelope (prong horn) are found in the mountains, and rabbits, hares, coyotes and prairie-dogs are common in the plains. The valley lands are fertile, but as the State lies within the arid region agriculture is conducted largely through irrigation. Irrigation in this State, until recent years, has been of a primitive character and was carried on by those dwelling here centuries ago, as evidenced by remains of ancient ditches, but the magnitude and possibilities of the system are not generally realized, and even yet the real irrigation systems of New Mexico are in their infancy, though certain sections have them well developed. Throughout the State many dams have been built to conserve the flood water and a large acreage is thus made fertile. Government irrigation projects include the Elephant Butte Dam with a storage capacity of 2,680,000 acre feet; and the Carlsbad System, which has reclaimed 24,500 acres of fertile land. The Storie Dam, a private enterprise at Las Vegas, will irrigate 12,000 acres. The Mimbres Valley and the lower Pecos region have been reclaimed by the use of artesian wells. While possessing important mineral resources, New Mexico is pre-eminently an agricultural country, 41 per cent of the population pursuing gainful occupations, being engaged in farming and stock-raising. The following table shows the acreage, yield and value of crops in 1910 and 1920:

	1910	1920
Number of farms in State.....	35,676	29,844
Approximate land area in State (acres).....	78,401,920	
Improved land in farms (acres).....	1,467,191	1,711,224
Total acreage of farms in State.....	11,270,021	24,409,633
Average acreage per farm.....	315.9	817.9
Value of farm land and buildings.....	\$111,430,000	\$221,814,212
Value of farm land.....	98,806,497	196,341,050
Value of buildings.....	13,024,502	25,473,162
Value of implements and machinery.....	4,122,312	9,745,369
Average value per acre of land and buildings.....	9.93	9.09
Average value per acre of farm land.....	8.77	8.04
Number of farms irrigated.....	12,795	11,390
Acreage irrigated.....	461,718	538,377
Per cent of number of farms irrigated.....	35.9	38.2
Per cent of improved land in farms irrigated.....	31.5	31.4
Capital invested in irrigation systems.....	\$9,154,897	\$18,210,412
Average cost of operation per acre.....	-\$1.36	\$2.41

The principal crops for 1922 were: Corn, 2,475,000 bushels; oats, 930,000 bushels; potatoes, 200,000 bushels; spring wheat, 660,000 bushels; barley, 140,000 bushels; apples, 750,000 barrels; broom corn, 1,500,000 tons.

New Mexico is the ninth State in the Union in the number of sheep of shearing age, with 2,062,000 in 1923, having a farm value, 1 Jan. 1923, of \$13,197,000. It produced in 1922 9,600,000 pounds of wool.

The returns for livestock for 1923 were as follows:

	Number	Value
Horses.....	181,000	\$8,145,000
Mules.....	21,000	1,386,000
Milch cows.....	47,000	2,350,000
Burros (1920).....	5,937	117,763
Cattle.....	838,000	18,352,000
Sheep.....	2,062,000	13,197,000
Goats (1920).....	226,862	1,091,076
Swine.....	89,000	890,000

Mineral Resources.—The mining industry is important. From 1860 to 1890 \$17,600,000 in gold was produced. The mineral output in 1922 was gold, \$374,000; silver, 700,000 ounces; copper, 31,000,000 pounds; lead, 2,600,000 pounds; zinc, 4,500,000 pounds. Coal mining is extensively carried on. The output of coal in 1921 (mostly bituminous) was 2,453,482 short tons, valued at \$9,585,000. The coal area lies chiefly in Socorro, McKinley, Santa Fé, Colfax and Rio Arriba counties, in the northern and western parts of the State. The coal-bearing formations aggregate 1,850,000 acres, of which about 40 per cent is probably productive. Iron, salt, gypsum, clay, soda, ochre, potash, mica, marble, molybdenum, tungsten and vanadium are also found as are turquoise, garnets, opals and chalcodony. The net value of all mineral output for 1920 was \$27,883,565; in 1921, \$13,227,268.

Manufactures.—The manufacturing in New Mexico is still in its infancy. There is a gradual increase from year to year. The last figures furnished by the government show that the capital invested in 1919 was \$15,226,253; cost of material was \$7,727,483; value of the product manufactured was \$17,856,402; value added by manufacturing was \$10,129,119; salaries and wages paid amounted to \$7,685,803.

A comparative summary for the State for 1909 and 1919 follows:

	Census —	
	1919	1909
Number of establishments....	387	313
Persons engaged in manufactures.	6,646	4,766
Proprietors and firm members.	336	288
Salaried employees.....	574	335
Wage earners (average number)	5,736	4,143
Primary horse power.....	17,260	15,465
Capital.....	\$15,226,253	\$7,743,000
Services.....	7,685,803	2,974,000
Salaries.....	1,027,341	383,000
Wages.....	6,658,462	2,591,000
Materials.....	7,727,483	3,261,000
Value of products.....	17,856,602	7,898,000
Value added by manufacture (value of products less cost of materials).....	10,129,119	4,637,000

Transportation.—The Atchison, Topeka and Santa Fé Railway and the El Paso and Southwestern Railway are the most important roads in the State. The total mileage of all roads is 3,709.8 miles. Passengers and freight are extensively handled by automobiles and trucks.

Finances.—New Mexico had a total assessed valuation in 1921 of \$363,721,981, a bonded debt of \$4,712,000 in the year 1922, and a tax rate which does not exceed \$4 per \$1,000. In 1922 there were 45 National banks with capital stock amounting to \$3,210,000; total assets, \$41,536,000; 59 State banks with capital stock amounting to \$2,150,000; resources, \$17,352,000. Adding \$7,500,000 to assessed valuation gives real value of all property on tax rolls. The bonded

indebtedness is as follows: State, \$4,712,000; county, about \$3,000,000; cities, towns and villages, about \$5,000,000; and school districts, about \$2,250,000.

Population.—(1870) 91,874; (1880) 119,565; (1890) 153,593; (1900) 195,310; (1910) 327,301 (native, white, 255,609; foreign, white, 26,331; Indians, 20,573; negroes, 1,628; males, 175,245; females, 152,056); (1920) 360,350. (native white, 273,317; foreign white, 29,077; Indians, 19,512; negroes, 5,733; males, 190,456; females, 169,894). The foreign-born population is made up as follows: Austrians, 423; Canadians, 732; Czechoslovakians, 113; Danes, 115; English, 888; French, 377; Germans, 1,178; Greeks, 288; Hungarians, 130; Irish, 434; Italians, 1,678; Yugoslavians, 535; Mexicans, 19,906; Norwegians, 128; Poles, 153; Russians, 254; Scots, 440; Spaniards, 198; Swedes, 311; Swiss, 148; Syrians, 198; all other, 451. Illiterates formed 15.6 per cent of total population in 1920, a reduction of 44.6 per cent from 1900. New census shows decided decrease as result of special efforts to reduce illiteracy in several counties.

Religion.—The population consists largely of Roman Catholics, who have an archbishop, a vicar-general, about 50 churches and more than 300 mission churches; several academies for young women, a college, eight parochial schools, Indian boarding schools, day schools for Indians, and academies for boys. The Baptists have 150 churches; the Methodists comprise 17 English-speaking and a number of Spanish-speaking congregations, together with a number of mission schools; the Presbyterians 45 congregations, 30 preaching stations, 25 mission schools with 45 teachers and 1,562 pupils; the Mormons two churches with 277 members. Other Protestant denominations have about 20 congregations, and the Hebrews five organizations and two synagogues.

Education.—The education system of New Mexico was not created until 1891. Prior to this time education had been taken care of by various churches. Those of outstanding importance were the Catholic, Methodist, Congregationalist and Presbyterian. While they and other churches have continued their interest in education, the State has developed a most complete and effective system. There are 1,430 schoolhouses, 2,752 school teachers, 81,399 pupils enrolled; annual expenditures \$3,301,712. The State maintains the University of New Mexico at Albuquerque, the College of Agriculture and Mechanic Arts at Las Cruces, the New Mexico Normal University at Las Vegas, the Normal School at Silver City, School of Mines at Socorro, Military Institute at Roswell, Spanish-American School at El Rito, Institute for the Deaf and Dumb and Institute for the Blind at Alamogordo. The expenditures for maintenance of these institutions is about \$1,000,000 per year. The outstanding movement in education to-day is consolidation of districts and the creation of county high schools.

Penal Institution.—The penitentiary at Santa Fé, the Reform School at Springer, are not only penal in their character but are considered reformatory and educational as well.

Charitable Institutions.—The Miners' Hospital at Raton and the Insane Asylum at Las Vegas are State institutions. In addition thereto, the State contributes to the following

NEW MEXICO

Capitol at Santa Fe

NEW MEXICO

1 Pueblo de Taos, New Mexico

2 Pueblo Indian Dance at Taos, New Mexico

private institutions: Saint Vincent's Hospital at Santa Fé, Grant County Hospital at Silver City, Sisters of Mercy at Silver City, Ladies' Hospital at Deming, Eddy County Hospital at Carlsbad, Sisters' Hospital at Albuquerque, Relief Society at Las Vegas, Gallup Hospital at Gallup, Saint Mary's Hospital at Roswell, Sisters of Loretta at Mora, Sisters of Loretta at Las Cruces, the New Mexico Orphan School at Santa Fé. The constitution permits appropriations to be made to the above institutions. Government sanatoria are at Fort Bayard and Fort Stanton, where soldiers and sailors from all parts of the country are treated for pulmonary tuberculosis. There are many private sanatoria in the State.

History.—For untold generations before the discovery of America, New Mexico was the home of sedentary tribes of Indians—the ancestors of the present Pueblos—as well as of nomadic predatory tribes. The former constructed villages, principally of stone, on the mesas, in the shelves of rocky cliffs (see CLIFF-DWELLERS), and in the valleys. Their numbers considerably exceeded that of their descendants of to-day, but there is no reasonable ground for the generally popular belief that New Mexico ever contained a teeming sedentary aboriginal population, notwithstanding the hundreds of ruins scattered throughout its area, particularly west of the Rio Grande. There is definite historical as well as traditionary evidence that many of the pueblos occupied at the time of the discovery of the Southwest were later abandoned on account of Apache and Navaho raids, or by reason of epidemics, the failure of water supply, through superstition, or the efforts of early Spanish missionaries to concentrate the natives. Many ruined pueblos in the State may thus be accounted for; for although Coronado in 1540–2 recorded 64 inhabited villages, some of them extensive, only two (Acoma and Isleta) of the 17 which remain still occupy their 16th century sites. The recorded history of New Mexico dates from 1539, in which year Marcos de Niza, a Franciscan friar, accompanied by a Barbary negro named Estevan, or Estevanico, traversed the country from Mexico to the Zuni Indian villages, then known as the "Seven Cities of Cibola," in the western part of the State. Estevan, preceding Fray Marcos during the latter days of the journey, was killed by the natives at their village of Hawikuh, one of the seven towns; Niza followed, viewed the pueblo from an adjacent height, and fled back to Mexico. In February of the following year Francisco Vasquez Coronado, guided by Niza and accompanied by a large force, marched from Compostela, Mexico, to Cibola, storming and capturing Hawikuh (which he named Granada), in July. Expeditions sent out from here by Coronado resulted in the discovery of the Hopi or Moqui villages (called Tusayan) in northeastern Arizona, and the Grand Cañon of the Colorado. In the autumn the army moved to the province of Tiguex, in the vicinity of the present Bernalillo, on the Rio Grande, where winter quarters were established and whence parties were sent to visit the neighboring pueblos.

In the spring of 1541 Coronado crossed the Pecos River into the present Texas and northward through the buffalo plains to the Wichita settlements of Kansas—the "Province of

Quivira"—where several months were spent in exploration; but gold, which formed the object of the dreary march, was not found. The expedition returned to the Rio Grande and thence to Mexico in the spring of 1542, having spent nearly two years in the country. Two friars remained in New Mexico and one in Kansas, but these were killed by the Indians. New Mexico was visited in 1581 by Francisco Sanchez Chamuscado, with a small escort and three Franciscans, the latter being left among the Rio Grande Pueblos. These were killed after Chamuscado's departure. Late in 1582 Antonio de Espejo, with a bodyguard, was authorized to explore the new province and to learn the fate of the missionaries. Following the route of Chamuscado up the Rio Grande, he reached Puala, or Puaray, near the present Bernalillo (the principal town of Coronado's province of Tiguex), where the friars had been slain, the Indians fleeing on his approach. From this point Espejo extended his travels to the pueblos of Sia, Jemez, Acoma and Zuñi, and to the Hopi towns of Arizona, thence eastward to the Rio Pecos and back to Mexico. The next important event was the colonization of New Mexico by Juan de Oñate, the first governor of the province, who reached the new country via the Rio Grande in 1598 with about 400 colonists, and established the town of San Francisco de los Españoles, later known as San Gabriel, where Chamita, at the mouth of the Rio Chama, now stands. All the sedentary tribes were visited and their vows of obedience and vassalage taken, and the country from eastern Kansas to the head of the Gulf of California explored between 1598 and 1605. In the latter year San Gabriel was abandoned and the seat of government moved to Santa Fé, which dates from this time. During the following few years the new colony barely existed; in 1617 it had only 48 soldiers and colonists, although the missionaries had been so zealous that 11 churches had been built and 14,000 natives baptized. In 1680 the Pueblos rebelled against Spanish authority, killed many missionaries and colonists, and laid siege to Santa Fé, where the panic-stricken survivors had taken refuge in the adobe palace, which still stands. Governor Otermin finally succeeded in driving the Indians off with considerable loss, and in retreating down the Rio Grande to El Paso, Texas, with a thousand followers, leaving the natives in almost uninterrupted possession of New Mexico until 1692. In that year Diego de Vargas reconquered the province, with great loss to the Indians, enabling its resettlement toward the close of the year by 800 colonists. In 1696 the Indians again revolted, killing five friars and 21 other Spaniards, and it was not until the close of the century that the Pueblos were entirely overcome.

Henceforward New Mexico grew in importance; new towns were established in the Rio Grande Valley, which slowly increased in population despite the constant depredations of the Apaches and Navahos. Early in the 19th century a considerable trade sprang up between the province and the settlements along the American frontier, notably Kaskaskia in Illinois, and later Franklin and Independence in Missouri, which increased from \$22,000 in 1822 to \$750,000 in 1844. This was the beginning of the overland commerce via the famous Santa Fé trail, which came to a close when the Atchison,

Topeka and Santa Fé Railroad entered the Territorial capital in 1880. Mexico having thrown off the yoke of Spain in 1821, New Mexico became a Mexican province; in 1824 it was made a Territory and in 1836 a department, remaining such until 1846, when it was taken possession of by General Stephen W. Kearny in the name of the United States. In 1848, by the Treaty of Guadalupe Hidalgo (q.v.), New Mexico, the boundaries of which were very indefinite, but which comprised Arizona north of the Gila (see GADSDEN PURCHASE) and a part of Colorado, was ceded to the United States, and on 25 Nov. 1850 the Territory was organized through the agreement by Texas to the New Mexico boundary, under the act of Congress approved 9 September. In 1863 western New Mexico became the Territory of Arizona, and in 1865 a northern strip was annexed to Colorado.

New Mexico was the scene of several conflicts during the Civil War, notably the defeat of the Federals under Canby by the Texans under Sibley at Valverde in February 1862. Santa Fé was occupied by the Union forces in March; Sibley took possession of it a week later, was forced to evacuate in April, after the defeat of the Confederates in Apache Cañon. Unsuccessful efforts for the admission of New Mexico as a State were made for many years, notably in 1906 when Arizona voted adversely on the Statehood bill. On 16 June 1910 the Senate passed the bill granting statehood to New Mexico, among the last of the remaining territories. This bill specifically provided, however, that the proposed State hold no legislative sessions prior to the first of January 1912. It also stipulated that the State set aside 100,000 acres for a State penitentiary.

Statehood.—New Mexico made many efforts to attain statehood. The final effort began with the passing of an Enabling Act, approved 20 June 1910, which provided for a constitutional convention which met at Santa Fé 3 Oct. 1910 and finished its labors 21 November. The constitution was ratified by a vote of 31,742 to 13,399, 21 Jan. 1911. On 21 Aug. 1911 the President signed the bill providing for the admission of New Mexico on the condition that it amend the article providing a method for the amendment of its constitution. This amendment was approved by the people, and on 5 Jan. 1912 President Taft issued a proclamation admitting New Mexico as a State.

Governors Since Statehood: Wm. C. McDonald, 15 Jan. 1912 to 1 Jan. 1917; E. C. De Baca, 1 Jan. to 18 Feb. 1917; W. E. Lindsey, 18 Feb. 1917 to 1 Jan. 1919; O. A. Larrazolo, 1 Jan. 1919 to 1 Jan. 1921; M. C. Mechem, 1 Jan. 1921 to 1 Jan. 1923; J. F. Hinkle, 1 Jan. 1923 to 1 Jan. 1925.

FRANK H. H. ROBERTS,
President, New Mexico Normal University.

NEW MEXICO, University of, situated at Albuquerque, New Mexico, an institution of learning established 28 Feb. 1889, in an act passed by the territorial legislative assembly of New Mexico. The normal school of the University was the first department organized and was opened 15 June 1892 for a summer term. In September 1892 the preparatory school was opened and in November 1893 the commercial

school was added. In 1896 the gymnasium was erected and equipped. In 1899 the Hadley Laboratory, largely the gift of Mrs. Walter C. Hadley was erected. In 1906 two dormitories in the Pueblo Indian style of architecture were built. In 1910-11 a school of music was initiated. During the year of 1911-12, co-ordinate with the change in State government the institution became the State University of New Mexico. The seven buildings of the University of New Mexico are picturesquely situated on the mesa, or elevated plateau about a mile east of the city of Albuquerque overlooking the wide valley of the Rio Grande. They consist of the administration building, Rodney hall, science hall, the women's dormitory, the men's dormitory, the gymnasium, the dining hall and the powerhouse. During 1914-15 a psychological laboratory was established. In 1913-14 there was organized an extension division. The school of Latin American Affairs established (1915-16) is designed to aid in strengthening and developing the relations between the United States and Latin-America. The University has received an appropriation from the State legislature for expenses and repairs and an appropriation of \$40,000 for the construction of a science hall. The library contains about 13,000 volumes exclusive of pamphlets. Two Cecil Rhodes scholarships have been won by students. The annual income for general support is about \$220,000.

NEW MEXICO COLLEGE OF AGRICULTURE AND MECHANIC ARTS, co-educational State institution, founded by legislative act dated 28 Feb. 1889, which accepted the provisions of the Morrill Act of 2 July 1862. It is located near Las Cruces in the Mesilla Valley in the heart of the great region irrigated by the Elephant Butte Dam. It confers the degree Bachelor of Science upon graduates in agriculture, home economics, civil engineering, electrical engineering, irrigation engineering, mechanical engineering, general science, vocational teaching. It has a large extension service, a faculty of 35, and a student body of about 392. It has done great service to the country in the training of "fighting mechanics."

NEW MEXICO NORMAL UNIVERSITY, the largest educational institution in New Mexico, was created by act of the legislature 3 Oct. 1893. On 3 Oct. 1898, the institution was opened at Las Vegas with 92 students. In 1899 the legislature reorganized the institution, creating it the State Teachers College. It comprises four schools: Training school, high school, normal school and a State Teachers College. Three degrees are conferred: Bachelor of pedagogy, master of pedagogy, bachelor of arts in education. Twenty-two regular professors, with a number of assistants, are employed. The attendance in 1917-18 was 1,283. The university property is valued at \$200,000. It controls nearly 400,000 acres and has an annual income of about \$50,000. The faculty numbers 20 and the student enrollment is about 140. There are 12,000 volumes in the library.

NEW MILFORD, Conn., town, county-seat of Litchfield County, on the Housatonic River, and on the Berkshire division of the New York, New Haven and Hartford Railroad.

It was settled in 1707 by John Noble from Westfield, Mass., and later a colony from (Old) Milford, Conn., located at New Milford. It is situated in a hilly country which has considerable good farm land; tobacco is the great specialty. The extensive water power of the Housatonic is being utilized by means of a canal two miles long, which extends from Bulls Bridge to New Milford. The New Milford Power Company which owns the plant furnishes electricity to towns at a considerable distance. The tobacco warehouses have over 500 employees; the wood finishing factory, 90; the hat factory, 285; upholstery works, 40; lime works, about 60. There are several other smaller manufacturing establishments. A library and Memorial Hall for the free use of the Grand Army veterans, the town hall, the churches, and schools are all fine buildings. The educational institutions are good public schools, Ingleside School for young women and Weanington School for boys. The government is administered by three selectmen chosen annually by the people. Pop. (1920) 4,781.

NEW NETHERLANDS, *neth'ér-landz*, the name given by the Dutch to the colony they established in America in 1626. A British fleet, under command of Richard Nicolls, captured the place in 1664; and by order of Nicolls, the Duke of York was made ruler and the name changed to New York. See NEW YORK.

NEW ORANGE, a name applied to New York in 1673, when the colony of New Netherlands was retaken from England by the States-General of Holland. The name was used in honor of the Prince of Orange.

NEW ORLEANS, La., the seventeenth city of the United States in population and the largest in the Southern States, is located on the east bank of the Mississippi River in the delta region, 107 miles above the mouth. It lies along the river front for about 12 miles and extends back toward Lakes Borgne and Pontchartrain. Its total area, including the suburb of Algiers on the west bank of the Mississippi, is 196 square miles, of which about 65 square miles are improved. Other suburbs—Westwego, Gretna, Amesville and Gouldsboro—do not belong to New Orleans. The boundaries of the city are coterminous with those of the parish of Orleans. Built originally along a great bend of the Mississippi River, it was called the "Crescent City," but long ago it outgrew this shape, though the principal streets running north and south still curve to follow the bend of the river. The site is flat with a slight slope away from the river to the swamps behind the city. The highest elevation above the sea is about 10 feet and in flood time nearly all of the city is from 4 to 12 feet below the level of the river, which is kept out by levees or dikes built along the entire front and graded down to the flat city site. On the river front silt is constantly deposited by the current and the land thus formed, called the *batture*, is from time to time taken into the city and surrounded by the levee. The climate is mild and damp, and the rainfall averages nearly 60 inches a year. The winters are short and the summers long. It is cooler in New Orleans than might be expected from its location, the temperature averaging 65° for 47 years. For

only 211 days in the last 43 years has it fallen below 32° and in only 11 days was it below 20°. On seven days in 43 years the temperature has reached 100°. About once in 10 years there is a light snowfall; frost comes for about 30 days in December and January, but seldom enough to injure the plants and flowers.

Population.—The population of the city has increased from 17,242 in 1810 to 339,075 in 1910 (1920, 387,219). The most rapid growth was from 29,737 in 1830 to 102,193 in 1840, an increase in 10 years of 243 per cent. The foreign element in the population has always been large but in recent decades the proportion has been decreasing. In order of numbers the foreign-born population is composed of Germans, Italians, Irish, French and English. The negro population is about 27 per cent of the total. The large native population of French or Spanish descent, called "creoles," has strongly influenced the social life, the manners and customs and the amusements of New Orleans. The original French inhabitants came from North France, from Acadia, from Haiti and San Domingo; the Spanish from Spain and Cuba and the Canary Islands during the Spanish control of the colony of Louisiana.

Streets and Buildings.—The streets in the old French city—the *Vieux Carré*—are narrow; in the newer American city they are wider, frequently with the centre or "neutral ground" planted in palms or trees. The great names of France and Spain still live in the street names of the old city—Chartres, Royal, Bourbon, Dauphiné, Iberville, Bienville, Conti, Orleans, Toulouse, Dumaine, Carondelet, Galvez, Unzaga and Miro. Canal street, the business and shopping centre, divides the *Vieux Carré* from the modern city. The French influence is seen in the architecture of the creole houses with their tiled roofs, courtyards, iron-railed balconies and in the galleries of the more spacious districts. So much of the French town was destroyed in the fire of 1794 that the public buildings have since shown a predominating Spanish influence. The old archbishop's palace dates from 1737 and was formerly the first Ursuline Convent; Saint Louis Cathedral and presbytery were begun in 1795, and the Cabildo, the *Casa Capitular*, or government house, with adjoining buildings, was erected in the same year. Here in 1803 Louisiana was transferred to the United States. The Pontalba buildings on the Place d'Armes (now Jackson Square) are of later date, as is also the famous French Market (*Halle des Boucheries*). Of the newer structures the following are the most noted: the Custom House, built under the supervision of Major (later General) P. G. T. Beauregard, on a floating foundation of cypress logs; the United States Mint; the New Court House; the City Hall and Criminal Court buildings; the new Post Office, the Cotton Exchange and the buildings of Tulane and Loyola universities. The great business houses are on Canal or adjoining streets. Noted hotels are the Saint Charles, the Grunewald, the De Soto, the Lafayette and the Monteleone.

Parks.—New Orleans has only two large parks though it has smaller breathing places in the numerous "squares," and some of the streets are almost parks in themselves. Audubon Park, named for the great naturalist,

reaches from the river to Saint Charles avenue and contains 249 acres. It was purchased by the city in 1871, in 1884-85 it was the site of the Cotton Centennial Exposition, and has been considerably improved only in recent years. In the 18th century it was a part of the plantation of Étienne de Boré, who in 1795 succeeded in making granulated sugar from sugar cane. It is fitting that the Sugar Experiment Station of the State University is now located in the park, which also contains a large horticultural hall, one of the Cotton Exposition buildings. The park is shaded by immense live oaks and the grounds are well laid out and planted with tropical plants and flowers. City Park, of 216 acres, on the Metairie Road, was formerly a part of the plantation of Louis Allard, and under the great "Duelling Oaks" many encounters took place in ante-bellum days. In Heinemann Park, or the "baseball park," the intercollegiate and other athletic contests take place. Near City Park are the Fair Grounds and the Jockey Club. The "squares," "places" and "circles" are small, parklike places, with walks and seats, and adorned with fountains, shrubbery and statues. Among them may be mentioned Jackson Square, formerly the Place d'Armes, and the centre of the old city, in which stands an equestrian statue of Andrew Jackson, by Clark Mills; Lafayette Square, with the statues of Henry Clay, by Joel T. Hart, and of John McDonough, who left his fortune to establish public schools; Lee Circle, formerly Tivoli Circle, with the monument surmounted by a statue of Robert E. Lee, by Boyle; Margaret Place, with Margaret Haughery's statue, commemorates the "patron saint" of New Orleans orphans; in Beauregard Square, formerly called Congo Square, the slaves once met to dance African dances and here bull-fights took place under Spanish rule. Other squares are: Annunciation, Clay, Fillmore, Douglas, McCarthy, Lawrence and Coliseum Place.

Cemeteries.—The cemeteries number about 40, some of the older ones being in the centre of the city. On account of the marshy nature of the soil the dead are usually buried in vaults or tombs above ground. In all the cemeteries are noted commemorative monuments and statues. Old Saint Louis Cemetery dates from the founding of the city and its curious vaults, one above the other, are called "ovens." Saint Louis No. 2 (1824), New Saint Louis and Saint Louis for colored people are, with Old Saint Louis, under Catholic control, as also is the Campo Santo of Saint Roch, with its wonder-working shrine, which is frequented by young girls on Good Friday. Three old Protestant cemeteries are Girod (named for a French Protestant mayor), Lafayette and Washington. On Metairie ridge are most of the modern cemeteries, the largest of which is Metairie. Here are the vaults of fraternal societies and the Confederate monuments and statues. Greenwood and the Firemen's Cemetery are nearby. At Chalmette is a national cemetery where nearly 30,000 Union soldiers lie buried.

Libraries and Museums.—The principal libraries of the city contain about 500,000 volumes. The largest collections are in the Public Library, with five branches; the State Library, consisting principally of law books, in

the new Court House; the Howard Memorial Library, a private foundation, which has a very complete collection of publications relating to Louisiana and the Southern States; and the libraries of H. Sophie Newcomb College and of Tulane and Loyola universities. The State Museum, occupying the old Cabildo, has valuable historical, archæological and documentary collections relating to Louisiana, and a large exhibit of the agricultural and mineral resources of the State.

Educational Institutions.—In New Orleans there are 95 public schools, including three high schools, with an enrolment of 55,000, while the 125 parochial and private schools have 30,000 students. In the public schools are 1,500 teachers, and the public school property is valued at \$5,000,000. Notable among the private and church schools are the Ursuline Convent, the oldest school in the Mississippi Valley; the Dominican Convent, the Newman Manual Training School, the Metal Trades School and the College of the Immaculate Conception. A city normal school trains teachers for the public schools. The Delgado Vocational School, made possible by a bequest of a million dollars, is now being organized by the city school board. Among the private schools of higher grade for negroes are Leland University (Baptist), Straight University (Congregational) and New Orleans University (Methodist). The Baptists have recently established a college for white girls called the Baptist Bible Institute. Loyola University (Roman Catholic) is a new institution of university grade, with academic and law departments. H. Sophie Newcomb Memorial College is one of the leading colleges for women in the Southern States and is affiliated with Tulane University. The latter is the oldest institution of college grade in the State. It is based on an old State foundation and was developed through the aid of a bequest of \$1,000,000 by Paul Tulane. It now has academic, engineering, law, pharmacy and medical departments, with an enrolment of 2,000 students. The Medical College of Tulane University and the hospitals have made New Orleans one of the chief medical centres of the United States.

Charitable Institutions.—Chief among the charitable institutions is the Charity Hospital, an old Spanish foundation, now supported by the State and by private donations and staffed with nurses by the Catholic Sisters of Charity. It has accommodations for more than a thousand patients, and gives treatment to more than 30,000 patients each year. Other well-known hospitals are the Hotel Dieu (Catholic), Touro Infirmary (Jewish), Presbyterian Hospital, Eye, Ear, Nose and Throat Hospital, Flint-Goodrich Hospital for negroes, the United States Marine Hospital and 10 smaller institutions. There are 21 orphan homes, 10 homes for the aged and destitute, a private insane asylum, three homes for wayward women, the State Confederate Soldiers' Home and the Kingsley House settlement modeled after Hull House of Chicago. About 50 of the more than 100 charitable and beneficent institutions receive slight financial aid from the city.

Churches.—There are more than 300 churches in New Orleans, of which two-thirds are for the whites and the others for negroes.

The principal denominations in orders of numbers are Roman Catholic, Baptist, Methodist, Presbyterian, Episcopalian, Lutheran, Jewish and Christian Science.

Amusements and Social Life.—The festivals of Mardi Gras are of French origin, but have been adopted by all nationalities, and are now so widely famed that thousands of visitors are attracted each year to the city. The first celebration was in 1827 when young creoles who had been at school in France organized a masked street procession. The first of the present carnival clubs—the “Mystic Krewe of Comus”—was formed in 1857; in 1870 the “Twelfth Night Revellers”; in 1872 “Rex” and the “Knights of Momus”; the “Krewe of Proteus” in 1882; the “Krewe of Nereus” in 1895. Later-formed organizations are the “Atlanteans,” “Elves of Oberon,” and the “High Priests of Mystras.” The events of the Mardi Gras season begin on Thursday and end on Shrove Tuesday (Mardi Gras). There are balls, dinners, street and river parades, and many unorganized carnival activities in which nearly the whole population takes part, while business is almost suspended. There is much agreeable club life in the numerous organizations of New Orleans. The most noted clubs are the Boston, Pickwick, Chess, Checkers and Whist, Harmony (Jewish), Round Table, Stratford and the Era Club for women. There are numerous rowing, yachting, hunting, fishing and athletic clubs as well as Catholic and Protestant social and religious organizations. The cuisine of New Orleans has been made famous by many good cooks. Noted French restaurants are La Louisiane, Galatoire’s, Antoine’s and Madame Begné’s.

French opera was introduced into America through New Orleans and until recently the city had each season a troupe from France. But the war in Europe prevented the coming of the troupes and now the famous French Opera House has been given to Tulane University.

Health Conditions, Drainage, Sewerage.—For nearly a century New Orleans was known as one of the most unhealthy spots in North America. Before the Civil War there were almost annual epidemics of yellow fever, several severe visitations of cholera, and always malaria. But since 1860 health conditions have gradually improved and the death rate has steadily declined. Before 1860 the death rate per thousand averaged 60; in 1900 it was 29; in 1905 it was 24; and in 1914 it was 17. The death rate for whites is always lower than for blacks; in 1914 it was 14 per thousand. This lessening death rate is due to the betterment of sanitary conditions during the last 50 years and in particular to the improvements made since 1900 in the water supply, the drainage and sewerage and in the inspection of food supplies. The water supply, formerly taken unfiltered from the river and from rainwater cisterns, now comes from immense municipal filtration plants which purify 63,000,000 gallons a day. Mosquito breeding cisterns have been abolished. Drainage and sewerage has been likewise improved. Owing to the flat and low situation of the city and the heavy rainstorms it was long considered almost impossible to dispose of sewerage properly. Before 1900 open gutters were used, the streets were frequently flooded and standing water everywhere offered breeding

places for the yellow fever and malaria-bearing mosquitoes. But in 1903 the sewerage and water board put into operation a system which has completely transformed conditions. Instead of one system of sewerage as in most cities there are three systems in New Orleans, all aided by immense pumping stations to give sufficient fall. The first is for sewerage which is carried in 310 miles of pipes to the lower edge of the city and pumped over the levee into the Mississippi River; ordinary drainage, which is only slightly polluted, is carried by pipes and large canals into Bayou Bienvenue and thence into Lake Borgne and the Gulf. The unpolluted rainwater is carried by a third system into Lake Pontchartrain. Twenty years ago water could be found at one to two feet from the surface; now it is from 5 to 15 feet. The mosquito has been almost driven away and fevers have greatly decreased. A visitation of the bubonic plague in 1914 caused the tearing down or the reconstruction of every building in New Orleans which was not rat-proof. Both the State and the city health authorities maintain the strictest inspection over food supplies, hotels and eating places. The picturesque French market and its several replicas still stand but are closely screened and rigidly inspected. Cholera comes no more, yellow fever epidemics gradually became lighter and last appeared in 1905. New Orleans is now one of the most healthful of the large cities.

Railway and Harbor Facilities.—New Orleans was established by Bienville as a gateway to the Mississippi Valley, and until railways began to compete with water transportation it was without a serious rival as the port of that region. There are two ways to the Gulf—by the Mississippi River and by Lake Pontchartrain, and 13,500 miles of navigable rivers lead to its wharves. The rapid growth of the city before the Civil War was due mainly to the development of river and ocean transportation. Railway competition at that time was not important. But the Civil War closed the port for five years and much of its trade was then lost to Eastern ports. Railways were already, before 1860, connecting the Mississippi Valley with the Atlantic Coast, the bars at the mouth of the river hindered ocean-going commerce and river transportation was never again, after 1861, on a thriving basis, declining in fact to practically nothing where it now remains. Not until 1880 did the port of New Orleans do as much business as in 1860. Since then there has been a regular increase due to the development of ocean-going commerce and the building of railroads from the interior to New Orleans. During the last 15 years the city has reached its former place of primacy as the greatest port of the South and one of the greatest in the United States. Much of this is due to recent permanent harbor improvements made at public expense. The Eads jetties and later government dredging assure 35 feet of water at the passes to the Gulf. The harbor with unlimited anchorage space is the river itself, 40 feet deep at the edge of the wharves and 200 feet in mid-stream which is here one-third to two-thirds of a mile wide. Wharf space owned by the public extends for 12 miles on each side of the river and is under control of the Dock Board, a State institution which has control over all harbor improvements. The Dock Board has

constructed eight miles of wharves and on them are six miles of steel sheds to protect cargoes from the weather. There is a public owned cotton warehouse with a capacity of 500,000 bales, a public owned grain elevator with a capacity of 2,000,000 bushels, and privately owned elevators with a total capacity of 5,000,000 bushels. The United States government has just completed on the wharves three huge warehouses for general commodities, two of which will be turned over to the Dock Board. Ships load and unload anywhere along the eight miles of wharf, using the best mechanical devices. A belt railway, 50 miles long, publicly owned and operated, connects all railways, wharfs and about 80 industries, so that in transshipping the shortest distance separates the car and the ship. The coaling facilities are excellent. Under private control are the Stuyvesant Docks of the Illinois Central Railway, the Chalmette Railway and steam terminals of the Southern Railway, and the Algiers terminals of the Southern Pacific Railway. The Inner Harbor or Industrial Canal connects the Mississippi River with Lake Pontchartrain and gives a fixed water level needed by certain industries, another approach to New Orleans and the opportunity to industrial concerns to lease harbor frontage which cannot now be done on the river front which is owned by the State. The canal is six miles long, 300 feet wide and has a depth of 30 feet. The Dock Board has by State law 41 miles of river front under its control, and can indefinitely extend the harbor facilities. At Algiers, across the river, is the United States Naval Station with complete repair facilities and a dry dock which can raise vessels up to 18,000 tons. Three privately owned dry docks can accommodate vessels up to 2,000, 5,000 and 15,000 tons. Forty-five steamship lines sail from the port, a Japanese line being the latest established. Inland water transportation is almost negligible, the inland waterways now serving principally to keep down railway freight rates. Twelve railways, 10 of them trunk lines, enter the city, among them the Illinois Central, the Louisville and Nashville, the Southern and the Southern Pacific. The railways represent a mileage of 145,288 with 215 miles of terminal track. They reach New Orleans by easy grades and freight rates are nearly all on the basis of water competition. The railways coming in from the West have their terminals across the river. Railways and industries which do not own terminal facilities can enter on the public belt railway.

Commerce and Manufactures.—New Orleans has long been the chief commercial city of the South and in normal times ranks next to New York in exports and imports. Before 1860 its prosperity was due largely to the fact that it was the best outlet for the products of the Mississippi Basin and to the development of water transportation. At one time it even looked forward to being a rival of London, but the bars at the mouth of the Mississippi River, the frequent epidemics of disease, the conservatism of the people, the losses due to the Civil War, the development of east and west railways in the upper Mississippi Valley, and the fact that the city was off the main lines of world trade, all combined to check its progress. Since 1870 many of the hindering conditions have been done away with, river

navigation and port facilities have been much improved, the city has become a great railway centre with low freight rates, and it is again one of the leaders in foreign and domestic commerce. It is favorably situated for the distribution of foreign commerce into the region west of the Appalachians and for exports from the same region, especially to Mexico, Central America, the West Indies and South America. The opening of the Panama Canal has stimulated commerce with western South America and the Orient. In 1911 and again in 1915 the volume of foreign trade through New Orleans was exceeded only by New York. The war in Europe (1914-18) cut off temporarily much of its former trade, and in 1918 it ranked as the sixth port of the United States. In 1914 the exports through the port of New Orleans were valued at \$193,839,961, and the imports at \$89,382,621—a total of \$283,222,582; in 1918 the total was \$418,536,295. New Orleans is the largest market in the United States for cotton and cotton-seed products, rice, sugar, bananas, oysters and shrimp; the second coffee market; and the largest lumber market of the South. As an export market for Western grain it is developing rapidly. The total distribution of commodities in 1918 was estimated in value at \$1,130,000,000. The public grain elevators, and cotton warehouses which issue negotiable receipts for cotton, and the low port and transshipment charges, are responsible for much of the city's commercial progress. Leading commercial organizations are the Cotton Exchange, whose statistics are the standard for the United States, the Board of Trade, Contractors and Dealers' Exchange, Stock Exchange, Sugar and Rice Exchange and the Association of Commerce with its 12 bureaus. As a manufacturing centre New Orleans is of less importance. In 1914 its manufactured products were valued at \$70,000,000; in 1918 at \$140,000,000. The leading manufactured products are sugar and molasses, rice, cotton-seed products, bags, tobacco, cotton goods, clothing, foundry and machine-shop products, canned goods and steel and wooden ships. There are nearly 1,000 manufacturing plants with an invested capital of about \$60,000,000.

Bank Resources.—Resources of the 15 most important banks amounted in 1918 to \$235,126,824; deposits were \$167,142,600. Clearings were, in 1900, \$556,000,000; in 1910, \$987,000,000; in 1918, \$2,660,460,000. The 1918 clearings show the influence of the war as well as indicate increased wealth. Practically all the huge public improvements recently undertaken by the city and State have been financed by local banks.

Government.—Under the French and Spanish régimes New Orleans was not a municipality but was governed as a part of the colony of Louisiana. In 1805 it was organized as an American city under a charter which recognized the fact that the city was merely a collection of villages and to each it gave almost independent government. In 1836 on account of the conflicting racial elements in the population a new charter provided for three almost separate governments over the three districts or "faubourgs" which had been combined into the city. A mayor and council exercised general supervision over the whole, but the plan

Jackson Square and Cathedral

was not satisfactory and 16 years later it gave way to the usual consolidated American city government with mayor and district councilmen. In 1870 under the "reconstruction" régime a new charter provided for what is now known as "commission" government—a mayor and seven "administrators" being elected on a general ticket. This government, on account of its origin, was unpopular and in 1882 the city was again put under a mayor and district councilmen but with numerous appointive boards to attend to most municipal functions. There were boards for police, education, fire prevention, public debt, sewerage and drainage, parks and streets, water, etc. The city was divided into 17 wards and seven civil districts, thus recognizing the seven towns or "faubourgs" which by this time had been united into the city of New Orleans. This form of municipal government lasted for 30 years and was superseded in 1912 by a "commission" government of a mayor and four other commissioners elected on a general ticket. The administration was divided into five departments each of which was headed by a commissioner: (1) Public affairs under the mayor; (2) public finance; (3) public safety; (4) public utilities; (5) public property. Numerous appointive administrative boards still exist and the division of the city into seven districts and 17 wards continues.

Public Finance.—The city still suffers from indebtedness placed upon it during the "carpet bag" days, which, however, has been considerably lessened. In 1910 the bonded debt was \$32,500,000 and the floating debt about \$1,000,000. Since then the bonded debt has been considerably increased on account of public improvements. Much of the improvement, however, more than pays the interest on the cost. The assessed value (75 per cent of property) was \$221,000,000 in 1910 and in 1918 it was \$442,874,412. The combined State and city tax rate on the true value of property amounts to 21 mills. The income from taxes is about \$9,200,000, which is distributed as follows: For city administration, \$3,000,000; for schools, \$1,162,000; for water and sewerage, \$1,500,000; for interest on the bonded debt, \$3,321,000; and any balance is divided between the city administration and the sewerage and water board.

History.—The present site of New Orleans was occupied by a village of the Houma Indians in 1699 when Bienville's expedition first explored the lower Mississippi River. Bienville was impressed by the fact that the land here was the highest for many miles around and seemed to be above overflow. Moreover it was accessible not only from the river but also by way of the lakes lying to the rear. So in 1718 he established a French post here for the purpose of guarding the gateway to the lower Mississippi Valley, whence access to the interior for trade and for military expeditions was easier than from Biloxi or Mobile, the older French settlements. The new town was named Nouvelle Orléans in honor of the regent of France, the Duke of Orleans, and in 1722 it became the capital of the colony. The French town was laid out in the form of a rectangle—whence the name of the old part of the city—*Vieux Carré*. The sending over from France of the "cassette" girls (girls with dowry) in 1727 as wives for the colonists and the establish-

ment of schools was an assurance of permanence to the colony. But neglected by the home government, the town and colony grew slowly. Settlers came from France and Canada, and some Germans were sent out by John Law of the Mississippi Company, but they were few in number, and at the end of the French régime in 1763 the city had less than 4,000 inhabitants. However, the Catholic Church was organized, teaching and missionary orders were established and trade with the Indians and some commerce with the home country developed. By a secret treaty in 1762 Louisiana was ceded to Spain, but the latter made no effort to take possession until 1768. Meanwhile the colonists, dissatisfied with the proposed transfer, planned to ask for British protection, and in 1768 when Antonio de Ulloa, the first Spanish governor, came, he was driven out by a rebellion which was, however, ruthlessly suppressed the next year by Capt.-Gen. Alexandro O'Reilly. Spanish rule was firmer and more intelligent than the French, and the population was increased by immigrants from Spain, Acadia and the West Indies. But the colony remained distinctly French, the Spanish authorities making no serious efforts to change its institutions. Great fires in 1788 and 1798 destroyed much of the *Vieux Carré* and resulted in the erection of better buildings. A considerable trade developed, the stringent commercial regulations of Spain were seldom enforced in Louisiana, and in 1794 New Orleans was made a free port of deposit for the trade of the United States west of the Appalachians. The western Americans considered an open port at New Orleans of the utmost importance to them and when in 1801 Spain ceded the colony back to France a demand arose for the possession of the port by the United States. So in 1803 with the purchase of Louisiana, New Orleans, then a town of 10,000 inhabitants, became American, and in 1805 it was given the usual American city charter. The growth under American rule was rapid in spite of controversy among rival races and nationalities. For half a century it was the centre of activity of adventurers and soldiers of fortune who had designs in the West, and in Mexico and other Latin-American countries. In 1812 the first steamboat from the Ohio region reached New Orleans, inaugurating a long period of transportation activity on the inland waterways. In 1830 the second railroad in the United States was opened from New Orleans to Milneburg on Lake Pontchartrain, and between 1850 and 1854 the city gained railway connections both to the east and west. In 1852 New Orleans was the third city in size in the United States. Its location has made it, in war time, a position of great military importance, and in 1815 the British under General Pakenham planned to seize it and thus to hold the gate to the Mississippi Valley. But on 8 Jan. 1815 the British army was defeated by the Americans under Gen. Andrew Jackson at Chalmette, just below the city. (See NEW ORLEANS, BATTLE OF). In 1861 with the formation of the Confederacy, New Orleans became a centre of military and naval operations but the mouth of the river was soon blockaded by the Union fleet and in 1862 the city was captured by military and naval forces under the command of Admiral Farragut and Gen. Benjamin Butler. (See NEW ORLEANS, CAPTURE OF, IN

1862). During the remainder of the war it was under Union control. General Butler's rule was notoriously bad, but that of his successors was less objectionable. Although the city declined in population and wealth for a time after 1862, a slow recovery followed. New Orleans remained the capital of the colony and State until 1852 and was again the capital from 1865 to 1880. From 1867 to 1877 New Orleans was the stronghold of the "radical" or "carpet-bag" government of Louisiana, and the old Saint Louis Hotel was used as a state-house. The city was bankrupted by the corrupt ruling class and to this day it carries a heavy debt incurred by the Reconstructionists. Canal street was the scene on 14 Sept. 1874 of a battle between the conservative whites and the radical forces, in which the latter were defeated and the state government overturned for a few days. In 1884-85 the Cotton Centennial Exposition was held in New Orleans. David C. Hennessy, chief of police, was murdered in 1891 by members of the Mafia, an Italian secret society; nine men arrested for the murder and acquitted in court were seized by a mob and lynched. Considerable diplomatic negotiations ensued between the governments of Italy and the United States. (See ITALY, DIPLOMATIC RELATIONS OF THE UNITED STATES WITH). During the last 20 years New Orleans has made its soundest and most rapid progress.

WALTER L. FLEMING,

Professor of History, formerly of Louisiana State University, now of Vanderbilt University.

NEW ORLEANS, Campaign and Battle of, in the War of 1812. On 15 Aug. 1814, after signing a treaty with the Creeks (see HORSESHOE BEND), Jackson went to Mobile, having been appointed commander of the Seventh military district. There he learned that on 25 July 1814, Maj. Edward Nicholls, with 110 British troops and three cannon, had appeared before Pensacola, Fla., accompanied by a British fleet under Capt. W. H. Percy. Though the Territory belonged to Spain, Nicholls seized Fort Barrancas at the entrance to the harbor, armed and clothed the Indians, and unsuccessfully endeavored to enlist the services of Jean Lafitte (q.v.) and his band of pirates

infesting Barataria Bay (q.v.), about 60 miles south of New Orleans. Nicholls also sent Percy with the *Hermes*, 22 guns, the *Carron*, 20, the *Sophie* and the *Childers*, 18 each, and a force of 60 marines and 120 Indians to capture Fort Bowyer, a battery at the entrance to Mobile Bay. At the fort, which was armed with 20 guns (of which only eight were serviceable), were 130 troops under Maj. William Lawrence. On 12 Sept. 1814 the ships opened fire on the fort while the troops attacked from the rear, but so superior was the American gunnery that the *Hermes* was soon cut to pieces, and was set afire by Percy; the other ships and the troops withdrew, going to Pensacola. The total British loss was 232, of whom 162 were killed, while the Americans lost only four killed and five wounded. Jackson was intent on taking Pensacola and on 3 November, despite warnings that a large British force had left Ireland to take Mobile, New Orleans and the surrounding country, started for Pensacola with 4,100 men. On his arrival he demanded that the Spanish governor surrender but the latter refused, whereupon, on the seventh, Jackson divided his troops into three columns, stormed the defenses of the town and quickly forced the Spanish to surrender unconditionally. The British then abandoned Fort Barrancas, whereupon Jackson returned to Mobile, then proceeded to New Orleans, where he arrived 2 December, and found that, despite the proximity of the British expedition, the city was utterly unprepared to defend itself. Accordingly he caused fortifications and batteries to be erected at advantageous points; stationed a few gunboats at the bay of Saint Louis, 60 miles to the northeast of New Orleans; and sent messengers in every direction urging troops to hasten to his aid.

Meanwhile the British fleet arrived with the troops under Maj.-Gen. Sir Edward Pakenham (q.v.). On 10 Dec. 1814 the troops were landed at Chandeleur Island at the entrance of Lake Borgne, but on entering the lake beheld six American gunboats under Lieut. Thomas A. C. Jones (q.v.) prepared to oppose them. Accordingly, on 14 December, 980 seamen and marines in 45 launches and barges attacked Jones' little flotilla and after a sanguinary contest destroyed them with a loss to themselves of 17 killed and 77 wounded, while the American loss was six killed and 35 wounded. This left only two vessels, the *Louisiana* and the *Carolina*, to dispute the British passage up the river. Hence, during the next week, 7,000 British troops were disembarked at Isle aux Poix in Lake Borgne and a force of about 1,700 troops under Col. William Thornton was sent in advance by Maj.-Gen. John Keene, bivouacking in the open about six miles from the city. Learning of this, Jackson, on the night of 23 December, took 2,131 troops and attacked from two different points on land while the *Carolina* slipped down the river and poured grape into the British ranks. The British were being slowly driven back when a fog arose, causing confusion in the American ranks, and as British reinforcements were arriving Jackson retired. In this battle the British lost 46 killed, 167 wounded and 64 missing, while Jackson's loss was 24 killed, 115 wounded and 74 missing. The British then pushed forward so that by 25 December, 8,000

troops under Pakenham and Sir Samuel Gibbs were ready for battle, to oppose whom Jackson had altogether about 5,000 infantry.

Jackson took position about five miles below New Orleans. The Rodriguez Canal about 10 feet wide stretched across the plain from the river to the swamps and Jackson caused this to be deepened and a parapet thrown up behind it. The *Louisiana* lay about two miles below Jackson's line and the *Carolina* a mile further down the river. When the British advanced they first had to drive away these two ships; on 27 December the *Carolina* was bombarded with hot shot, set afire and destroyed, while the *Louisiana*, after sustaining a severe fire, escaped up the river. The British then continued their march expecting little opposition, but soon, to their surprise, came upon Jackson's half-finished breastworks. On 1 Jan. 1815 the British turned their batteries on these works, but the Americans replied with such precision that the British soon deserted their guns with a loss of 76 killed and wounded and two missing, while Jackson lost only 11 killed and 23 wounded. Failing in these attacks Pakenham waited until 6 January for the arrival of two fresh regiments under Maj.-Gen. John Lambert, thus bringing his force nearly up to 10,000. On the night of the seventh Pakenham sent 1,200 troops under Thornton to attack the American works on the west bank, which were defended by 800 men under Col. David Morgan and Daniel T. Patterson's battery; while he himself was to assault Jackson's lines, General Gibbs attacking on the right, and Keane on the left, Lambert being in reserve. A motley array of sailors, regulars, creoles, pirates, negroes, Frenchmen, Kentuckians and Tennesseans held Jackson's left, while the centre was defended by Carroll's brigade of 1,414 men, and the right by 1,327 men, Adair's Kentucky brigade of 325 men being held in reserve, the total on both banks and in reserve being a few over 5,000. Early on the morning of 8 January the British advanced, Gibbs' troops coming first under the American fire, which was so terrific that they broke and fled. On receiving reinforcements they renewed the attack but were again repulsed, whereupon Pakenham reformed them and himself led the third attack only to fall in front of his men, Gibbs, too, falling soon afterward. Meanwhile Keane's division attacked Jackson's right near the river but was repulsed with great slaughter and Keane was severely wounded, the command then devolving on Lambert who instantly withdrew the troops. On the west bank Thornton had routed Morgan's troops, compelled Patterson to spike his guns, and advanced up the river a mile behind Jackson's lines, thus placing him in a precarious position, but fortunately Lambert withdrew his troops and recalled Thornton, thereby saving Jackson. After the battle a truce of two days was arranged to bury the dead and until 18 January artillery fire was indulged in, but then the whole British army withdrew to a fortified position at the mouth of a bayou and on the 27th reembarked in the ships off Chandeleur Island. Though variously stated, the most trustworthy authorities place the total British loss at 2,036 and the American loss at 71.

Meanwhile a few of the British vessels entered the river with the intention of reducing

the works at Fort Saint Philip and then co-operating in the attack on the city. They bombarded the fort from 11-18 Jan. 1815, but as their shells had little effect they abandoned the attack. Still the British seemed loath to depart without striking a blow. Reinforced by 1,000 fresh troops, Lambert bombarded Fort Bowyer 8 February and sent troops to attack from the rear. Lieut.-Col. William Lawrence had only 360 men in the fort and, therefore, capitulated on the 11th. This ended the land fighting in the War of 1812, peace having already been declared. NEW ORLEANS, Capture of, in 1862.

The Civil War engagement which resulted (24 April) in the taking of New Orleans, was actually fought 70 miles down the Mississippi. The great bend next below the city was commanded by Fort Jackson on the west (north) bank and Fort Saint Philip on the east. Supposed to mount 150 guns each, they had in fact 109 together, over half of them only 24's; and the garrison was largely Northerners and foreigners. The river was blocked by a chain buoyed by 11 steamer-hulks, and there were fire-raft and boats above. Farragut's fleet comprised 17 wooden vessels with 162 guns; besides six gunboats with 30 guns and 20 mortar-schooners with one gun each, under command of David D. Porter (q.v.). Bombardment on the forts was opened 18 April; and on the night of the 20th a Union vessel hugging the bank got above the boom, and coming down with a full head and current, snapped the chain and left the channel free. After three days' more bombardment it was determined to pass the forts instead, in the dark, and on the morning of the 24th, about 2:30, the vessels steamed forward in two columns, Farragut leading one in the *Hartford*, Capt. Theodorus Bailey the other, while the mortar-boats shelled the water-battery commanding the approach to Fort Jackson. All but the last three of Farragut's column succeeded in passing the boats before daylight made it impossible, the vessels' guns in turn driving the fort gunners from their posts. Above, the Confederate

flotilla of 17 vessels inflicted great damage, one Union gunboat being sunk, one badly crushed by a ram and the *Hartford* fired by a fire-boat. Nine Confederate vessels were sunk or captured, however, and the Union fleet proceeded to New Orleans and compelled it to surrender. On the 28th the forts also capitulated. It is due to history to add that of the 17 Confederate vessels, 9 of which were rams and 2 ironclads, only 4 vessels and 12 guns were in such condition as to be capable of making a fight. If the materials of the force of John K. Mitchell, the Confederate commander, had been completed, his little fleet could have made a very creditable defense; but J. R. Soley, of the United States navy, truly says that no commander, taking hold of his vessels in their incomplete condition four days before the fight, could have made much out of them. This victory of Farragut's prevented Louis Napoleon from recognizing the Confederacy and raising the blockade, and hence was one of the most important of the war.

JOSEPH T. DERRY,
Author of 'History of Georgia.'

NEW ORLEANS UNIVERSITY, in New Orleans, La.; a coeducational institution for the education of young negroes, founded in 1873 under the auspices of the Methodist Episcopal Church. It has preparatory and collegiate departments, and its courses lead to the degrees of A.B., B.S. and Ph.D. In 1913 there were connected with the school 40 teachers and 605 students. The library contains over 6,000 volumes, the grounds and buildings are valued at \$250,000.

NEW PHILADELPHIA, Ohio, city, county-seat of Tuscarawas County, on the Tuscarawas River and the Ohio Canal, and on the Pennsylvania and the Baltimore and Ohio railroads, about 100 miles northeast of Columbus and 90 miles south of Cleveland. It was settled in 1805 and incorporated in 1808. It is in an agricultural region, but its good water power and facilities for transportation have contributed toward making it a manufacturing city. Clay and coal are found in the neighborhood. Some of the manufactures are pressed, stamped and enameled goods, steel products, flour, woolen goods, brooms, canned goods, vacuum cleaners, tile, and wagons and carriages. Shorenbraun Springs and Tuscora Park, the public library, hospital, high school and orphans' home are of interest. The mayor is elected biennially and the council appoint or elect the administrative officials. Pop. 10,713.

NEW PHILIPPINES, fil'i-pīnz or -pēnz, a name sometimes given to the Caroline Islands (q.v.).

NEW PLATONISTS. See NEO-PLATONISM.

NEW PLYMOUTH, New Zealand, the capital and seaport of Taranaki, North Island, 120 miles southwest of Auckland. The harbor is noted and from this port a great deal of the dairy produce of the neighborhood is shipped. New Plymouth is also a terminal of railway lines to Wellington and Napier. The town contains flourishing flour mills, for it is in the centre of a rich cereal district. There are 'so leather factories. Pop. 5,141. Consult *australasian Year Book*' (Melbourne 1906).

NEW POMERANIA, or **NEU POMMERN**, noi pōm'ern, formerly **NEW BRITAIN**, the largest island of the Bismarck Archipelago (q.v.), 50 miles distant from Kaiser Wilhelm's Land, New Guinea, Rock Island and the Dampier, and the Vitiaz straits, intervening. It is crescent shaped, 300 miles long, with a maximum breadth of 90 miles and an estimated area of 9,500 square miles. It is of volcanic formation, the mountains culminate in Mount Hurstein in the extreme west (6,000 feet) and they are mostly forested to the tops. The coastal belt is fertile. There is a German mission and trading station on the northeast coast. The inhabitants are savage Papuans.

NEW PROVIDENCE, one of the Bahama Islands (q.v.), northeast of Andros Islands and about 300 miles east by north of Key West. In 1629 the first English settlement on the Bahamas was made on New Providence. This island has the best harbor of any of the group. Nassau (q.v.), the capital of the islands, is on New Providence. Although this island, as all of the group, belongs to Great Britain, it is included in the Roman Catholic archdiocese of New York. Pop. 13,554.

NEW RED SANDSTONE, in geology, a term formerly used, in contradistinction to Old Red Sandstone (q.v.), of red shale, loam and sandstone lying above the coal measures. The nomenclature is faulty, being based only on a color distinction, and it is now recognized that the rocks formerly grouped under this name are at two very different eras, the Permian and Triassic (qq.v.).

NEW RIVER. See GREAT KANAWHA.

NEW ROCHELLE, rō-shēl', N. Y., city, in Westchester County, on Long Island Sound and on the New York, New Haven and Hartford Railroad, 16½ miles from the Grand Central Station in New York City. It has connection by New York, Westchester County and Bronx electric railroad, and trolleys with New York City and several of the villages and cities in the vicinity. It was settled in 1687 by Huguenots and was named after La Rochelle, France. It has a beautiful location and is considered a desirable residential city by a large number of the business men of New York. It has a well-kept park, over 60 miles of paved streets and Glen Island, Echo and Neptune bays are nearby. The prominent buildings are a number of old colonial edifices, several of the churches, especially Saint Gabriel's (R. C.), with its parish school building, both gifts of Adrian Iselin, the Masonic Temple, a hospital, Knights of Columbus and the city buildings. The water supply is exceptionally pure; and the vital statistics show a low death rate. It is the seat of the Ursuline Seminary of Saint Teresa, founded in 1898, and it has several private schools, good public and parish schools and a public library which contains about 9,000 volumes. Thomas Paine resided here for some years, and it is the home of a number of well-known authors, editors and artists. Pop. 36,213.

NEW ROOF, The, a term used in early American history for the Federal Constitution.

NEW SALLEE, sā-lā', Morocco. See RABAT.

NEW SARUM, sā'rūm. See SALISBURY.

NEW SHETLAND. See SOUTH SHETLAND ISLANDS.

NEW SIBERIA, or **LIAKHOF** (lĕ-āh'ōf), **ISLANDS**, a group of islands in the Arctic Ocean, off the north coast of Siberia, between the mouths of the Lena and Indigirka, and administratively attached to the government of Yakutsk. The group includes Liakhof, Maloi, New Siberia, Thaddeus, Kotelnoi and Bennett Islands; the area is estimated at 20,480 square miles; they are rocky, treeless, icebound all the year round, and uninhabited. Reindeer, foxes and white bears are found, and there is immense wealth in fossil ivory, the remains of mammoth, rhinoceros and buffalo. The first discovery was made by the Cossack Vaghin in 1712.

NEW SOMERSETSHIRE, in American history, a name given the territory extended to William Gorges in 1636, and comprising those settlements along the coast of Maine, which had not been included in the Ferdinando Gorges patent of 1631. William Gorges, a nephew of Ferdinando, was appointed first deputy-governor of the district.

NEW SOUTH SHETLAND ISLANDS. See SOUTH SHETLAND ISLANDS.

NEW SOUTH WALES, Australia, the oldest Australasian colony of Great Britain and since 1901 one of the six original and the most populous, though not the largest state of the commonwealth, in the southeastern portion of the continent. It is separated from Queensland on the north by an irregular line running southwest from Port Danger in lat. 28° 8' S., till it meets the 29th parallel of latitude which forms the rest of the north boundary; on the east the Pacific Ocean is the boundary; on the south the Murray River, and a line running northwest from Cape Howe, lat. 37° 31' S., separates it from Victoria; while on the west the 141st meridian forms the boundary between the state and South Australia.

The state has an area of 310,700 square miles divided into 141 counties. It is more than twice the size of the State of California and five times the size of England and Wales. A federal district of 900 square miles was set aside in 1911 for the new capital of the commonwealth. See CANBERRA.

Topography.—The surface, more especially in the eastern and most populous portion, is much diversified, and presents, in its general features, a succession of hills and valleys, mountains and plains. The great dividing chain, forming the great watershed of the state, with many summits varying in height from 3,000 to 6,000 feet, extends from north to south nearly parallel to the coast, at a distance of from 30 to 50 miles inland or sometimes more, and takes in the north the name of Liverpool Range, in the centre that of the Blue Mountains, and in the south that of the Australian Alps. The highest summit is Mount Kosciusko, in the southeast 7,328 feet. The space between the mountains and the sea is partly broken by spurs and ramifications, but descends from the west with more or less rapidity, and has a generally undulating surface, intersected by water-courses; in some places well wooded, and in others covered with dense

brush-wood. The coast line presents in general bold perpendicular cliffs of sandstone, in horizontal strata. Occasionally the cliffs are interrupted by low sandy beaches, some of which stretch to a considerable distance inland, and appear to have been covered by the sea at no very remote period. The indentations of the coast are remarkable for their number, and the excellent harbors which they form. Among them are Port Stephens, Port Hunter, Broken Bay, Port Jackson (on which lies Sydney), Botany Bay, Jervis Bay, Sussex Haven and Two-fold Bay.

Hydrography.—The most important rivers are the Murray, which is navigable as far as Albury (long. 147° E.); the Murrumbidgee and Lachlan, farther north, which after uniting fall into the Murray; and the Darling, which flows from northeast to southwest through the whole extent of the state, and also falls into the Murray. The Darling, in its upper course known as the Barwon, has among its more considerable affluents the Bogan, the Macquarie, the Castlereagh, the Naomi, the Gwydir, the Macintyre and the Warrego. The Murrumbidgee is 1,350 miles long, the Darling 1,160, the Macquarie 750, the Lachlan 700. Notwithstanding the existence of those large rivers the western plains are but sparsely watered. The comparatively narrow space between the mountains and the Pacific leaves little room for the development of large rivers. Many of them are for a great part of the year either altogether dry, or form a succession of deep ponds or water-holes instead of continuous streams. The chief are the Hunter, 300 miles, which falls into the fine port of that name at Newcastle, and is navigable for 50 miles above its mouth by small craft of 30 to 40 tons; and the Hawkesbury, 330 miles, which falls into Broken Bay, and is navigable by vessels of 100 tons as far as Windsor, a distance of 140 miles. Others are the Shoalhaven, 260 miles; the Clarence, 240 miles, of which 70 are navigable; the Macleay, 190 miles; and the Richmond, 120. Some of these rivers in the winter season cause disastrous floods.

Geology and Mineral Resources.—In the southeast, east and middle the prevailing rocks are Palæozoic (Silurian and other), with granite and other igneous rocks forcing their way to the surface, and in this region are chiefly situated the metalliferous deposits in which New South Wales is so rich. In the east Carboniferous and Permo-Carboniferous rocks also occur extensively, and to these belong the large and valuable coal fields of the country. Valuable sandstones also exist here in abundance. Cretaceous rocks extend over a wide area in the north and west, and the plains are mostly of Pleistocene origin. In connection with the granite, limestone, both granular and foliated, occurs in abundance, and besides being often hollowed out into stalactitic caverns, sometimes passes into a beautiful close-grained marble, as white as that of Carrara.

The coal fields extend over an area of 10,000 acres, with more than 91 mines. The state exports considerable quantities of coal to the west coast of North and South America. Copper ore of the richest quality and tin exist in large quantities, and iron is very generally distributed. Gold is found in all parts of the

state; the value of the output in 1915 was \$3,314,095, showing a considerable diminution; the total value of the output of gold since its discovery in 1851 until 1915 is \$305,951,850. Most of the gold is sent to the mint for coinage. The combined value of the silver and lead output in the same year was over \$11,547,090. Copper valued at \$1,172,185 was obtained in 1915. Several varieties of precious stones have been found, notably opals.

Climate.—As the area of the state extends over 110 degrees of latitude and contains a good deal of elevated ground, nearly every variety of climate is to be found. In the north the climate is tropical, while on the table-lands severe frost is not uncommon. The interior plains are very dry, and severe droughts occasionally kill millions of sheep, but the coast districts have abundant rains. Though the hot winds of the warm season are annoying, they are not unhealthful, while storms and electrical disturbances are comparatively rare.

Forestry, etc.—About one-fourth of the area of the state consists of forest lands, which in 1887 were taken under the care of the government by the creation of a Forest Conservation Department. The timber reserves, including state forests, cover an area of about 7,250,000 acres. For the Flora and the Fauna of the state, see AUSTRALIA.

Agriculture and Stockraising.—The absence of water renders much of the land useless for agricultural purposes, but a large proportion is devoted to pasturage and grazing. In some places artesian wells have been introduced with good results. There is no great breadth of highly fertile land away from the river bank; but the fertility of the land on the margins of rivers is exceptional. Where liable to inundation, however, the year's harvest may be swept away in a few hours. Great reservoirs built along the river courses have greatly lessened the dangers of drought and inundation. The area under cultivation in 1915 was 4,808,627 acres, and the crops included wheat, maize, barley, oats, rye, millet, potatoes, lucerne and artificial grasses, vines, orange-trees, sugarcane, some tobacco, etc. Dairy husbandry is becoming important, and butter is exported. Native fruits are neither numerous nor valuable, but the best of those of Europe are acclimatized. So well does the peach thrive, for instance, that farmers sometimes feed their pigs with the windfalls of their orchards. Other fruits include oranges, apples, pears, apricots, nectarines, cherries, plums, figs, grapes, melons, mulberries, gooseberries, currants, etc., and in the more northern parts the banana is abundant. The rearing of silkworms on the mulberry, which might be carried to an almost indefinite extent, has attracted attention. The grapevine is successfully cultivated, as well as the sugarcane; considerable quantities of wine, brandy and sugar being made. The rearing of sheep (of which there are 32,583,000 in the state) and cattle are the chief employments of the people, 146,295 persons being engaged in agricultural and pastoral pursuits during the year ended 30 June 1915.

Commerce and Industries.—Wool is the most important article of export. The annual value of this export is not without fluctuation, but is again increasing. Wool exports in 1915 reached a total of \$61,000,000. Other important

exports comprise coal, silver ore, silver lead, gold and coin, frozen and preserved meat, butter, tallow, leather, wheat and flour. The principal imports are wearing apparel, sugar, tea and hardware. The value of the total exports in 1916 was \$204,791,580, of imports \$166,898,485.

The manufacturing industries are naturally not of much importance as yet, but they are already very varied, and help to supply a considerable share of the home demand. In 1915 there were 4,188 miles of railway open, nearly all constructed by government, which has spent over \$350,000,000 upon the railways.

Government.—The constitution of New Wales vests the legislative power in a parliament of two houses, namely the Legislative Council and the Legislative Assembly. The former consists of not less than 21 members nominated by the Crown (52 in 1916), originally for the term of five years, but, subject to certain conditions, for life at the expiration of that period; and the latter of 90 members chosen by the same number of constituencies. Members of the Assembly receive \$1,500 per annum, and they are entitled to travel free by rail or tram in the state. As electors require no property qualification there is virtually universal suffrage. The executive consists of a governor nominated by the Imperial Parliament, assisted by a Cabinet composed of Premier and Colonial Treasurer, the ministers for lands, public works, mines, labor and industry, agriculture, education and justice, and the attorney-general. The parliaments last for three years. Unless local acts supersede them the imperial laws are enforced. No enactment of the state legislature becomes law till sanctioned by the governor, and in some cases by the sovereign. The state sends six representatives to the federal senate, and 27 to the federal house of representatives. For defense see AUSTRALIA.

Population.—The population is 2,101,968, of whom 1,072,424 are males and 1,029,544 females, chiefly British-born subjects. The aborigines number about 2,012 and the Chinese 6,105. Sydney (population, including suburbs, 955,900) is the capital, and other urban centres are Broken Hill, Newcastle, Parramatta, Goulburn, Maitland, Auburn and Bathurst.

Religion and Education.—There is no established religion. Among the religious sects the Church of England, Roman Catholics, Presbyterians, Wesleyan and also Methodists, hold the chief places. The Church of England has 734,000 adherents, the Roman Catholics, 412,013; the Presbyterians, 182,911; and the Methodists, 151,274. Education has been since 1880 controlled by a minister of public instruction. The public schools are classified as public primary schools, superior public schools in the chief centres of population, evening schools, high schools for boys, and high schools for girls. Primary education is compulsory, and in state primary and superior public schools is free. Among the higher educational institutions are the Sydney Grammar School, and Saint Paul's, Saint John's and Saint Andrew's colleges, and the Women's College, the colleges being all connected with the University of Sydney—an important institution, attended by 1,798 students and granting degrees in arts, medicine, science and law. Technical education is ad-

ministered by a special branch of the department of public instruction. In 1915 there were 17 high schools, 1,992 public primary schools and 520 provisional schools with 265,446 pupils. In addition there were 718 private schools, with 78,619 pupils and 3,682 teachers.

History.—New South Wales was discovered by Captain Cook in 1770, and founded as a penal settlement (at Botany Bay) in 1788, the convicts being employed in road-making and preparing the soil for agriculture. One of its early governors was the notorious Captain Bligh, who was deposed by the colonists in 1808. The most important events in its history since convict immigration ceased in 1840 are the establishment of representative institutions in 1843; the erection of Victoria into a separate colony in 1850; the discovery in May 1851 of extensive gold tracts; the rush to the diggings, with consequent great increase in population and prosperity; and the incorporation of the colony in the Australian commonwealth in 1901. The first railway, from Sydney to Parramatta, was opened in 1855. Among more recent events are the Sydney Exhibition held in 1879, and the Intercolonial Conference held at Sydney in 1883. The colony celebrated its centenary in January 1888, and a special series of stamps of elaborate design was issued in commemoration of the event. On 1 Jan. 1901 Sydney was the scene of the inauguration of the first governor-general of the new commonwealth, Lord Hopetoun. (See AUSTRALIA; AUSTRALIAN FEDERATION). Consult Griffin, 'New South Wales, Her Commerce and Resources' (1888); Hutchinson, 'New South Wales; the Mother Colony of the Australias' (1896); 'Official Year Book of New South Wales'; David, T. W. E., 'New South Wales' (London 1912).

CHARLES LEONARD-STUART.

Editorial Staff, 'Encyclopedia Americana.'

NEW SWEDEN, or NEW SWEDELAND, a name given in the 17th century to land lying between the Dutch colony of New Netherlands and the English colony of Virginia. It included territory in what is now Delaware and New Jersey. It was settled in 1638 by a colony from Sweden; and in 1655 it was taken possession of by the Dutch.

NEW TESTAMENT. See BIBLE.

NEW TESTAMENT CHRONOLOGY, the approximate dates of the events recorded in the gospels and other books of the New Testament summarized according to the findings of the best scholarship of recent years. The unity in diversity of the different texts of the evangelists is synchronized by chapter and verse references to related incidents. Allowing for the preparatory incidents which led early chroniclers to approximate the beginnings of the Christian Era at 9-8 B.C., the principal events may be outlined as follows:

- B.C. 9-8.—Zacharias, priest at Jerusalem, husband of Elisabeth received a prophecy that he would be the father of John the Baptist, Luke i, 5-25. At Nazareth, Mary espoused to Joseph of the house of David, received a prophecy that she would be the mother of the Messiah, Luke i, 26-29.
- B.C. 7.—Elisabeth, Zacharias' wife, made a similar prophecy to Mary, when the latter visited her for a stay of three months in a hill town of Judea, Luke i, 39-56.
- B.C. 6.—John the Baptist was born, Luke i, 57-80.
- B.C. 5-4.—The census at Jerusalem; the birth of Jesus at Bethlehem, Matthew i, 18-25, Luke ii, 1-7. The vision

and visit of the shepherds to the manger, Luke ii, 8-20. The circumcision of Jesus at Bethlehem, and his presentation in the temple at Jerusalem, Luke ii, 21-24. Simeon and Anna's prophecies, Luke ii, 25-38. The visit of the Magi to Jerusalem and Bethlehem, Matthew ii, 1-12. The warning and flight of the Holy Family into Egypt; Herod's slaughter of the innocents; Matthew ii, 13-18; Luke ii, 39-40.

- B.C. 3-2.—Sojourn of Joseph, Mary and Jesus in Egypt and return to Nazareth, Matthew ii, 19-23.
- A.D. 1-7.—Jesus accompanied his parents when they "went to Jerusalem every year at the feast of the Passover," Luke ii, 41.
- A.D. 8.—"Jesus tarried behind in Jerusalem" without his parents' knowledge, and they returning "after three days found him in the temple, sitting in the midst of the doctors, both hearing them, and asking them questions," Luke ii, 41-50.
- A.D. 9-26.—Jesus lived with his parents in Nazareth "and was subject to them . . . and Jesus increased in wisdom and stature, and in favor with God and man," Luke ii, 51-52.
- A.D. 26.—John the Baptist son of Zacharias, received the word of God in the wilderness and went "into all the country about the Jordan preaching the baptism of repentance for the remission of sins," Luke iii, 3; Matthew iii, 1-12; Mark i, 1-8; John i, 1-28; Acts i, 5.
- A.D. 27.—The baptism of Jesus by John in the Jordan, Matthew iii, 13-17; Mark i, 9-11; Luke iii, 21-22; John i, 29-34. The temptation of Jesus in the desert of Judea, Matthew iv, 1-11; Mark i, 12-13; Luke iv, 1-13; Jesus gains disciples at the Jordan and in Galilee, John i, 35-51. The marriage at Cana in Galilee, John ii, 1-12.
- A.D. 28.—Jesus drives the traders out of the temple at the Passover, John ii, 13-25. Nicodemus a ruler of the Jews, confers with Jesus, John iii, 1-21. Jesus leaves Jerusalem but remains in Judea and baptizes: Further testimony to Christ by John the Baptist, John iii, 22-36. John is imprisoned, and Jesus departs into Galilee and "from that time began to preach," Matthew iv, 12; xiv, 3-5; Mark i, 14; vi, 17-20; Luke iii, 19-20; iv, 14; John iv, 1-3. Jesus goes to Samaria, discourses with the Samaritan woman; and many Samaritans acknowledge "that this is indeed Christ, the Saviour of the world," John iv, 1-42. Jesus teaches publicly in Galilee, Matthew iv, 17; Mark i, 14-15; Luke iv, 14-15; John iv, 43-45. Jesus again visits Cana, where he heals the son of a nobleman lying ill at Capernaum, John iv, 46-54. Jesus returns to Nazareth "where he had been brought up; and, as his custom was he went into the synagogue on the Sabbath day and stood up for to read," then he began to preach and all "wondered at the gracious words;" but as he proceeded "they were filled with wrath" and would have killed him "but he passing through the midst of them went his way and fixed his abode in Capernaum," Luke iv, 16-31; Matthew iv, 13-16. The call of Simon Peter and Andrew, of James and John the sons of Zebedee, and the miraculous draught of fishes on the Sea of Galilee near Capernaum, Matthew iv, 18-22; Mark i, 16-20; Luke v, 1-11. The healing of a demoniac in the synagogue at Capernaum, Mark i, 21-28; Luke iv, 31-37. The healing of Peter's mother-in-law and others, Matthew viii, 14-17; Mark i, 29-34; Luke iv, 38-41. Jesus goes with his disciples from Capernaum throughout Galilee, Matthew iv, 23-25; Mark i, 35-39; Luke iv, 42-44. The healing of a leper, Matthew viii, 2-4; Mark i, 40-45; Luke v, 12-16. The healing of a paralytic at Capernaum, Matthew ix, 2-8; Mark ii, 1-12; Luke v, 17-26. The call of Matthew, Matthew ix, 9; Mark ii, 13-14; Luke v, 27-28.
- A.D. 29.—Jesus goes to Jerusalem and at the pool of Bethesda, heals the infirm man. Jesus subsequent discourse, John v, 1-47. The Pharisees censure the disciples for plucking ears of wheat on the Sabbath day, Matthew xii, 1-8; Mark ii, 23-28; Luke vi, 1-5. Jesus heals the withered hand on the Sabbath day in the synagogue of Capernaum, Matthew xii, 9-14; Mark iii, 1-6; Luke vi, 6-11. Jesus arrives at the sea of Tiberias, followed by multitudes, Matthew xii, 15-21; Mark iii, 7-12. Jesus retires to the mountain near Capernaum and chooses the 12 disciples; multitudes follow him, Matthew x, 2-4; Mark iii, 13-19; Luke vi, 12-19. The Sermon on the Mount, Matthew v, 1-13; Luke vi, 20-49. The centurion's servant at Capernaum is healed, Matthew viii, 5-13; Luke vii, 1-10. The raising of the widow's son at Nain, Luke vii, 11-17. John the Baptist in prison sends disciples to Jesus, Matthew xi, 2-19; Luke vii, 18-35. The testimony of Jesus concerning John and the marvelous works of the day, Matthew xi, 20-30. Jesus eating by invitation with a Pharisee is anointed by a repentant sinful woman. The parable of the two debtors, Luke vii, 36-50. Jesus and the 12 disciples make a second journey around Galilee, Luke vii, 1-3. The healing of a demoniac; The Scribes and Pharisees blaspheme; Matthew xii, 22-37; Mark iii, 19-30; Luke xi, 14-15; 17-23. The Scribes and Pharisees seek a sign Jesus' comments, Matthew xii, 38-45; Luke xi, 16; 24-36. Jesus declares that the true disciples of Christ are his nearest relatives, Matthew xii, 46-50; Mark iii, 31-35; Luke viii, 19-21. Jesus prophesies woes against the

Pharisees and others at a Pharisee's table, Luke xi, 37-54. Jesus discourses to his disciples and the multitude, Luke xii, 1-59. The slaughter of certain Galileans; parable of the barren fig tree; Luke xii, 1-9. Parable of the sower, Matthew xiii, 1-23; Luke vi, 1-25; Luke viii, 4-18. Parable of the tares and other parables, Matthew xiii, 21-53; Mark iv, 26-34. Jesus crosses the Lake of Galilee; incidents; the tempest stilled; Matthew viii, 18-27; Mark iv, 35-41; Luke viii, 22-25. The two demons of Gadara, Matthew xiii, 28-34; ix, 1; Mark v, 1-21; Luke viii, 26-40. Levi's feast; Discourse on fasting; Matthew ix, 10-17; Mark ii, 15-22; Luke v, 29-39. The raising of Jairus' daughter; the woman with an issue of blood; Matthew ix, 18-26; Mark v, 22-43; Luke viii, 41-56. Two blind men healed, and a dumb spirit cast out, Matthew ix, 27-34. Jesus visits Nazareth and is again rejected, Matthew xiii, 54-58; Mark vi, 1-6. The third journey around Galilee; the 12 disciples instructed and sent forth; Matthew ix, 35-38; x, 1, 5-42; xi, 1; Mark vi, 6-13; Luke ix, 1-6. Herod perplexed, believes Jesus to be John the Baptist who had been beheaded at his command "for Herodias' sake," Matthew xiv, 1-12; Mark vi, 14-29; Luke ix, 7-9. The 12 disciples return, and Jesus retires with them across the lake; 5,000 people are fed; Matthew ix, 13-21; Mark vi, 30-44; Luke ix, 10-17; John vi, 1-14. Jesus walks at night on the Sea of Galilee-Genesareth, Matthew xiv, 22-26; Mark vi, 45-56; Luke vi, 15-21. Jesus' discourse to the multitude in the synagogue at Capernaum; many disciples turn back; Peter's profession of faith, John vi, 22-71. Jesus' discourse relating to eating with unwashed hands; Pharisaic traditions; Matthew xv, 1-20; Mark vii, 1-23. The daughter of a Syrophenician woman is healed, Matthew xv, 21-28; Mark vii, 24-30. A deaf and dumb man healed and several others; 4,000 people fed; Matthew xv, 29-38; Mark vii, 31-37; viii, 1-9. The Pharisees and Sadducees near Magdala again require a sign; Matthew xv, 39; xvi, 1-4; Mark viii, 10-12. The disciples on the northeast coast of the Sea of Galilee warned against the Pharisees and Sadducees; Matthew xvi, 4-12; Mark viii, 13-21. A blind man healed at Bethsaida, Mark viii, 22-26. Near Caesarea Philippi, Peter and the other disciples again profess their faith in Christ, Matthew xvi, 13-20; Mark viii, 27-30; Luke ix, 18-21. Jesus foretells his death and resurrection, and the trials of his followers, Matthew xvi, 21-28; Mark viii, 31-38; ix, 1; Luke ix, 22-27. The transfiguration and the vision of Moses and Elias; Jesus' discourse with Peter, John and James; Matthew xvii, 1-13; Mark ix, 2-13; Luke ix, 28-36. The healing of a demoniac, whom the disciples could not heal, Matthew xvii, 14-21; Mark ix, 14-29; Luke ix, 37-43. Jesus again foretells his death and resurrection, Matthew xvii, 22-23; Mark ix, 30-32; Luke ix, 43-45. The provision of the tribute money at Capernaum, Matthew xvii, 24-27. The disciples contend who should be the greatest; Jesus counsels humility, forbearance and brotherly love, Matthew xviii, 1-35; Mark ix, 33-50; Luke ix, 46-50. Jesus goes to the festival of tabernacles; his final departure from Galilee; incidents in Samaria; Luke ix, 51-62; John vii, 2-10. The 70 instructed and sent out from Samaria, Luke x, 1-16. Ten lepers cleansed in Samaria, Luke xxi, 11-19. Jesus at the festival of tabernacles; his public teaching at Jerusalem; Luke vii, 11-53; viii, 1. The woman taken in adultery, Luke viii, 2-11. Further public teaching of Jesus; he reproves the Jews and escapes from their hands; Luke viii, 12-59. A lawyer instructed; Love to a neighbor defined; Parable of the Good Samaritan, Luke x, 25-37. Jesus in the house of Mary and Martha at Bethany, Luke x, 38-42. The disciples again taught how to pray, Luke xi, 1-13. The 70 disciples return to Jerusalem, Luke x, 17-24. A man born blind is healed on the Sabbath; Jesus' subsequent discourses; John ix, 1-41; x, 1-21. Jesus at the Festival of Dedication in Jerusalem; he retires beyond the Jordan, John x, 22-42. The raising of Lazarus at Bethany, John xi, 1-46.

A.D. 30.—The counsel of Caiaphas against Jesus; he retires from Jerusalem to Ephraim, John xi, 47-54. Jesus is followed by multitudes beyond Jordan; he heals the infirm woman on the Sabbath; Matthew xix, 1-2; Mark x, 1; Luke xxi, 10-21. Jesus goes teaching and journeying toward Jerusalem; Pharisees warn him against Herod; Luke xiii, 22-35. Jesus dines with a chief Pharisee on the Sabbath; incidents; Luke xiv, 1-24. What is required of true disciples, Luke xiv, 25-35. Parables of the lost sheep; the prodigal son; etc.; Luke xv, 1-32. Parable of the unjust steward, Luke xvi, 1-13. The Pharisees reproved; parable of the rich man and Lazarus; Luke xvi, 14-31. Jesus inculcates forbearance, faith, humility, Luke xvii, 1-10. The coming of Christ will be as sudden as the lightning, Luke xvii, 20-37. The parable of the importunate widow; the Pharisee and the publican; Luke xviii, 1-14. Jesus' teachings regarding divorce, Matthew xix, 3-12; Mark x, 2-12. Jesus receives and blesses little children, Matthew xix, 13-15; Mark x, 13-16; Luke xviii, 15-17. The rich young man; parable of the laborers in the vineyard; Matthew xix, 16-30; xx, 1-16; Mark x, 17-31; Luke xviii, 18-30. Jesus for the third time foretells his death and resurrection, Matthew xx, 17-19; Mark x, 32-34; Luke xviii, 31-34. James and John make their ambitious

request, Matthew xx, 20-28; Mark x, 35-45. The healing of two blind men near Jericho, Matthew xx, 29-34; Mark x, 46-52; Luke xviii, 35-43; xix, 1. The visit to Zaccheus the wealthy chief of the publicans at Jericho; the parable of the 10 pieces of money; Luke xix, 2-28. Jesus arrives in Bethany six days before the Passover, John xi, 55-57; xii, 1, 9-11. Jesus' entry into Jerusalem amid public rejoicings, Matthew xxi, 1-11, 14-17; Mark xi, 1-11; Luke xix, 29-44; John xii, 12-19. The barren fig tree; the cleansing of the temple; Matthew xxi, 12-13, 18-19, Mark xi, 12-19; Luke xix, 45-48; xxi, 37-38. The barren fig tree withers away, Matthew xxi, 20-22; Mark xi, 20-26. Christ's mission questioned; parable of the two sons; Matthew xxi, 23-32; Mark xi, 27-33; Luke xx, 1-8. Parable of the wicked husbandman, Matthew xxi, 33-46; Mark xii, 1-12; Luke xx, 9-19. Parable of the marriage of the King's son, Matthew xxi, 1-14. Insidious questions of the Pharisees and Herodians; tribute to Caesar; Matthew xxi, 15-22; Mark xii, 13-17; Luke xx, 20-26. Insidious question of the Sadducees; the resurrection; Matthew xxi, 23-33; Mark xii, 18-27; Luke xx, 27-40. A lawyer questions Jesus; the two great commandments; Matthew xxi, 34-40; Mark xii, 28-34. Christ is the son of David by the Holy Ghost; Matthew xxi, 41-46; Mark xii, 35-37; Luke xx, 41-44. Warnings against the evil example of the Scribes and Pharisees, Matthew xxiii, 1-12; Mark xii, 38-39; Luke xx, 45-46. Woes prophesied on the Scribes and Pharisees; Lamentations over Jerusalem; Matthew xxiii, 13-39; Mark xii, 40; Luke xx, 47. The widow's mite, Mark xii, 41-44; Luke xxi, 1-4. Greek visitors at the feast request through Philip of Bethsaida to see Jesus, John xii, 20-36. Comments upon the unbelief of the Jews, John xii, 37-50. Jesus on taking leave of the temple foretells its destruction and the persecution of his disciples, Matthew xxiv, 1-14; Mark xiii, 1-13; Luke xxi, 5-19. Christ's advent to be signalized by the destruction of Jerusalem and the overthrow of the Jewish state, Matthew xxiv, 15-42; Mark xiii, 14-37; Luke xxi, 20-36. The final hour of the coming of Christ; Exhortations to watchfulness; The parables of the 10 virgins; and of the 10 talents; Matthew xxiv, 43-51; xxv, 1-30. Scenes of the judgment day described, Matthew xxv, 31-46. The rulers conspire against Christ; the supper at Bethany; the treachery of Judas; Matthew xxvi, 1-16; Mark xiv, 1-11; Luke xxii, 1-6; John xii, 2-8. Preparation for the Passover at Bethany and Jerusalem, Matthew xxvi, 17-19; Mark xiv, 12-16; Luke xxii, 7-13. The Passover meal; contention among the 12 disciples; Matthew xxvi, 20; Mark xiv, 17; Luke xxii, 14-18, 24-30. Jesus washes the feet of his disciples; John xiii, 1-20. Jesus indicates the traitor; Judas retires; Matthew xxvi, 21-25; Mark xiv, 18-21; Luke xxi, 21-23; John xiii, 21-35. Jesus foretells the denial of Peter and the dispersion of the 12 disciples, Matthew xxvi, 31-35; Mark xiv, 27-31; Luke xxii, 31-38; John xiii, 36-38. The Last Supper, Matthew xxvi, 26-29; Mark xiv, 22-25; Luke xxii, 19-20; 1 Corinthians xi, 23-25. Jesus' last discourse with his disciples, comforting them, promising the Holy Spirit, foretelling persecution, and assuring them of joy and peace, John xiv, 1-31; xv, 1-27; xvi, 1-33. Jesus' prayer with his disciples, John xvii, 1-26. The agony in the Garden of Gethsemane, Matthew xxvi, 30, 36-46; Mark xiv, 26, 32-42; Luke xxii, 39-46; John xviii, 1. Jesus betrayed and made prisoner, Matthew xxvi, 47-56; ix, 43-52; Luke xxi, 47-53; John xviii, 2-12. Jesus taken before Caiaphas; Peter denies him thrice; Matthew xxvi, 57-68, 69-75; Mark xiv, 53, 54, 66-72; Luke xxii, 54-62; John xviii, 13-18, 25-27. Jesus before Caiaphas and the Sanhedrim, is condemned and mocked, Matthew xxvi, 59-68; Mark xiv, 55-65; Luke xxii, 63-71; John xviii, 19-24. The Sanhedrim lead Jesus away to Pilate, Matthew xxvii, 1, 2, 11-14; Mark xv, 1-5; Luke xxiii, 1-5; John xviii, 28-38. Jesus before Herod, Luke xxii, 6-12. Pilate seeks to release Jesus; the Jewish rabble demand the release of Barabbas the thief; Matthew xxvii, 15-26; Mark xv, 6-15; Luke xxiii, 13-25; John xviii, 39, 40. Pilate yields Jesus to be scourged and mocked, Matthew xxvii, 26-30; Mark xv, 15-19; John xix, 1-3. Pilate, after again seeking to release Jesus, delivers him to be crucified, John xix, 4-16. Judas in remorse hangs himself, Matthew xxvii, 3-10; Acts i, 18-19.

Friday 7 April, 30 A.D.—The Crucifixion, Death and Burial of Jesus Christ, Matthew xxvii; Mark xv; Luke xxvii; John xix. The Resurrection of Jesus Christ, Matthew xxviii; Mark xvi; Luke xxiv; John xx. Christ's subsequent appearances. He is seen by Peter; then by two disciples on the way to Emmaus, 1 Corinthians xv, 5; Mark xvi, 12-13; Luke xxiv, 13-35. Jesus appears in the midst of the apostles at Jerusalem, Thomas being absent, 1 Corinthians xv, 5; Mark xvi, 14-18; Luke xxiv, 36-49; John xx, 19-23. Christ again appears, Thomas being present, John xx, 26-29. The apostles go to Galilee, Jesus appears to nine of them at the Sea of Tiberias, Matthew xxviii, 16; John xxi, 1-24. Jesus appears to the apostles and a gathering of about 500 brethren on a mountain in Galilee, Matthew xxviii, 16-20; 1 Corinthians xv, 6. Christ is seen of James, then of all the apostles, Acts i, 3-8; John xv, 7. The Ascension at Bethany, Mark xvi, 19-20; Luke xxiv, 50-53; Acts i, 9-12.

CHARLES LEONARD-STUART,
Editorial Staff of *The Americana*.

NEW TESTAMENT PROBLEMS. If the importance of a writing be estimated by the influence it exerts and has exerted on the mind of men and on the history of the human (more particularly the Caucasian) race, *Homo Europæus*, and there seems to be no other standard nearly so just, then it must be admitted that the New Testament writings so far transcend all others as to form a class of their own. This affirmation need not be argued; it is undisputed. Hence it becomes a matter of supreme interest to understand these writings, from which modern no less than mediæval history takes its start, its form, its color, and, in great measure, its inspiration. But no understanding is final or satisfactory that is not historical. The question of Zoölogy is not, "What use have cattle for their horns?" but rather, "How did cattle get their horns?" So, too, the primary query with the critic is not, "What does the New Testament teach?" (this question is left to the divine and the theologian), but, How did these Scriptures come into being? Who wrote them? When? Where? Under what circumstances? And for what ends? The whole body of knowledge thus far attained, and, still more, the whole body of investigation touching these inquiries are comprehended under the title of New Testament Criticism. This latter has therefore, in first line, nothing to do with questions as to the truth or falsity of any teaching of the Scriptures, nor with any matters of doctrinal or dogmatic interpretation, except in so far as these latter may be bound up with the conclusions concerning the genesis of the Scriptures themselves. This criticism, then, is essentially a discussion of origins, and not of values. However, it need not be disguised that doctrinal values, or at least estimates, may often be seriously affected by our determination of origins. In case of some scientific verity or method, as of the Pythagorean theorem or the use of zero in numerical notation, it may be quite indifferent whether the source be found in Greece or in Egypt, in Babylon or in Japan; but in case of some article of faith, some doctrine regulative of life but beyond the reach of proof or disproof by experiment or by argument, it is by no means indifferent whether it be the dictum of some supramundane personality or some theosopheme of a sect of mystics, the utterance of an inspired Apostle or the refinement of some ancient Babylonian myth. The interest of New Testament Criticism is not, then, merely academic; it does not appeal solely to the cognitive faculties, to the civilization-making instinct for knowledge as knowledge: its secondary and derivative but hardly less important interests concern our active natures as well and bear upon the whole front of our practical and institutional life.

The first inquiry that meets the student of any document concerns the text itself. Is this latter an original, or is it a copy? Or per-

haps the copy of a copy? In either case, has it suffered any corruption, or is it a faithful transcript? In case there be many discrepant copies — the case actually presented — there will arise many questions as to the comparative age and authenticity of these copies, as to their relations to each other, and it will perhaps be necessary to reconstruct the supposed original from the contradictory attestations of these witnesses. Such is, in general, the text problem of New Testament Criticism, one of the most highly complex that ever challenged the efforts of the human understanding.

The testimony, which is enormous in amount, exists in the form of manuscripts, both uncials and cursives in the supposedly original tongue (the Greek), of translations, as Latin, Syriac, Æthiopic, Armenian, Gothic, of citations by the early Christian writers, of lectionaries arranged for liturgical use, of capitulations and versifications or divisions into chapters and verses, and so on. The problem of sifting and evaluating such a mass of evidence and striking the golden mean of truth would seem too difficult for human intellect, especially as there is no secure foothold at any point, nor any sure way of testing our results as we proceed. In the end there is no court of final appeal, and the whole case must be left undecided. Under such circumstances the marvel would seem to be that there should be any agreement at all, that there should not be as many minds as critics.¹ However, extremely numerous as are the points of diverse judgment, where adjudication seems hopeless, the number of agreements is still far greater, where critical opinions rest harmonious and undisturbed. Now it might be thought that this harmony would be extended and perfected by the discovery of new testimony, which of late years has proceeded apace, and by the deeper and minuter study of the long familiar evidence. But the fact is exactly the reverse. Accumulation of depositions and profounder investigations have confirmed some critical judgments, but have shaken many others and completely overthrown not a few. The problem is indeed becoming not less but more complicated with advancing knowledge, and the textual uncertainty was never before so great as it is now.

True it is that the last generation has witnessed the most brilliant attempts² yet made to construct the most highly probable text. Those masterly scholars, Bishop Westcott and Dr. Hort, thought they might, by a careful study of the genealogy of the various witnesses, attach a coefficient of value to each one singly and in combination, and thereby determine the original text in the overwhelming majority of cases with a close approach to certainty. Plausible and seductive as was their argumentation, and thoroughly accepted even now in many high quarters, it was yet fatally defective at many points and for several reasons, and can no longer command scientific assent. The "neutral" text which they posited as best represented by the great Vatican MS. B, is a figment of the imagination. The deference paid to certain great

¹ So Jerome's aphorism: *tot enim sunt exemplaria pene quot codices*, in his Preface to the Gospels, addressed to Pope Damasus.

² As by Tischendorf, Westcott and Hort, Weiss, von Soden.

uncials was unwarranted. The testimony of the Fathers and the versions was undervalued. The depreciation of the so-called Western text was undeserved. The rash assumption that F was a copy of G was unfortunate.¹ Closer study has shown decisively that at crucial points the witnesses upon which Westcott and Hort relied most confidently might all be misleading, and the MSS. most lightly esteemed might present the older reading. Even as the shepherd boy of old laid low the giant, so at any time may some neglected cursive or version or citation by the Fathers overthrow the most venerated uncial. Thus, the all-important word *Ρουμ*, in Rom. i, 7, 15, is attested by nearly all the best authorities; none the less it is an interpolation (Smith, J B L, 1901, Part I, p. 3 ff, Harnack, 'Preuschen's Zeitschrift,' 1902, I, p. 83 f). So, too, the position of the Doxology at the end of Rom. xvi is witnessed by N B C D and the best versions; nevertheless the position at the end of xiv is certainly the older. The Epilogue (xv and xvi) is given by nearly every authority, but, in spite of all, it is proved to be a later addendum; the Amiatinian and Fuldensian capitulations clearly point to its earlier absence.²

These examples also correct very usefully a prevalent notion that textual variations are after all merely trifles, like the fading line between Imperfect and Aorist or the impalpable refinements of Greek syntax. On the contrary, they are sometimes blinding in their illumination, in their revelation of the primitive structure of our Scriptures.

Thus, the textual facts just stated involve a complete reconstruction of our notions about *Romans*, which now seems to be no Epistle and not addressed originally to Romans, but to be a compilation of moral and theological essays, first addressed to "all those in love of God," afterward fitted out with Prologue and Epilogue as it now stands.

So, too, the extremely important F and G variant in Rom. ix, 22, unnoticed even by the best commentators (as Godet, Sanday, Weiss, Lipsius, Hofmann), indicates clearly the pure Judaic original of this famous chapter; the Christian hand has been laid on lightly and deftly but transfigures into a cosmic theory what was at first only a Jewish patriot's explanation of the delay of divine vengeance upon "vessels of wrath," the Pagan oppressors of his people—an observation more fatal to theological libraries than the torch of Omar. Consult 'The Hibbert Journal,' 1, 2, pp. 328, 329.

Still another notion must be corrected. Let no one imagine that all or nearly all the variants are mistakes or due to mistakes; very many are visibly intentional. It was the ancient habit, particularly of the Oriental, to compile and recompile, to edit and re-edit and re-edit again, and with sacred books this habit became almost an inviolable rule. No one disputes this fact in case of the Old Testament and the Apocrypha and the extra-canonical early Christian writings. It would be well-nigh miraculous if the New Testament Scriptures should offer exceptions. Before the establishment of the Canon no sacred awe in-

vested the canonics, there was no apparent reason why the favorite Scriptures should not be systematically modified to keep pace with the developing Christian consciousness, very much as our creeds are altered nowadays.³

It is notorious that the Old Catholic heresy-hunters charged upon their opponents, Marcion, Valentinus and the rest, that these latter had corrupted the Scriptures to suit their own heresies. The charge may often have been well-founded in the sense above defined, but it might undoubtedly have been retorted and was retorted with equal justice by the heretics upon the Orthodox. The great master, Hort, has himself said, in speaking of the "Doxology": "Indeed, 'copies corrupted by Marcion' need mean to us no more than 'copies agreeing in a certain reading with Marcion's copy.' . . . On the whole, it is reasonably certain that the omission is his only as having been transmitted by him, in other words, that it is a genuine ancient reading." Wetstein's great word holds good: "Various readings, almost all, are due to the zeal, ingenuity and guesswork of transcribers." Tischendorf admits: "It can not be doubted that in the very earliest days of Christianity there were multifarious departures from the pure Scripture of the Apostles, wherein to be sure there entered naught of dishonesty or guile." Under the deeper probing of Von Soden and others the original "neutral" B-text of W.-H. turns out to be only a very learned revision; the fault of the great Vatican is that it has considered "too curiously."⁴ It is impossible to blink the fact that all manuscripts of all parts of the New Testament abound in readings that are plainly second thoughts. Our most ancient and revered codices reproduce only deformed, transformed and highly elaborated originals. It is extremely noteworthy that the heretical readings are slowly coming to their rights, to be recognized as often more primitive, less subtly reflective forms. Thus in John i, 3 the Gnostics read: "And without him was made not one (thing). What was made in him was life," putting the full stop after *ἐν*, instead of after *ὑγιονεν* (was made); and their punctuation is at last adopted by W.-H. and Von Soden. In a word, it can no longer be doubted that Scripture was made from Dogma, not Dogma from Scripture.⁵

There is little reason then to hope for the establishment of a Received Text—the *ignis fatuus* of textual criticism, though not to despair of it be the last infirmity of noble minds. If such did not exist in the beginning, neither will it exist in the end. The discovery of new manuscripts, the collation of a few hundred more, will not bring the chaos to order but will make confusion worse confounded. Witness the publication of the Sinaitic Palimpsest in Syriac and the turning of attention to the famous Bezae Codex, called D: they have merely raised

³ In the same spirit King James' Translators, in their 'Address to the Reader,' wrote wisely and well.

⁴ As Holsten was led to observe—Holsten, the *Doctor subtilissimus* of Protestantism, the matchless master of exegesis, whose imposing reconstructions of Paulinism, by their very perfection, constitute the *reductio ad absurdum* of the premises and methods he employs.

⁵ It is indeed plain on its face that a doctrine must in general antedate its literary expression, and when we find this expression in a highly composite, apophthegmatic form, we may be sure it has been forged on the common anvil beneath the alternate strokes of more than one hammer.

¹ Smith, 'The Pauline MSS. F and G,' *Am. Jour. of Theo.*, July and October 1903.

² Smith, 'Unto Romans,' J B L, Vol. XXI, 1902, Part II, pp. 117-169.

new problems, not settled the old. It is perfectly just, then, and highly significant when Blass no longer quotes critical editions of the New Testament, but quotes the manuscripts themselves, never presuming to say what is the "true text." Such in theory at least is the position to which criticism must finally come. The critic's text, no matter how ingeniously or plausibly "berichtigt," is only the critic's text, not the "true text," after all.

And is such a mouse-like conclusion the only issue of the mountainous labors of centuries? Shall we know from year to year less and less what was the original autographic legacy, "the pure Scripture of the Apostles"? True. But this "less" is yet in a higher sense infinitely more. For we now come to recognize clearly the prime error of our assumptions thus far, and immeasurable is the progress involved in this recognition. It has, in fact, been everywhere and in every age tacitly assumed that there *was* in each case a unique autographic original, and that the problem of textual criticism was to discover that autograph, restore that original, and explain the manifold deviations therefrom. It is no reproach to criticism to have made this assumption and upheld it for centuries. No other was so natural or so plausible; none the less, it has proved unsatisfactory. In the face of the widening and multiplying diversities of the text-tradition, we can no longer range the Gospels and Epistles side by side with the Greek histories and the Letters of Cicero and ask how did Luke or Paul write it, just as we ask how did Thucydides or Plutarch or Pliny phrase it? In the Greek and Latin classics we recognize the works of the individual consciousness, here and there marred or corrupted, but each, in the main, single, solitary, self-consistent. Not so in the New Testament Scriptures. There we are confronted less with an individual than with a collective and communal consciousness. This consciousness is not always the same. By no means. It varies widely from the Synoptics to the Johannines, from the Paulines through the Catholics, to the Apocalypse. But it is nowhere individual, nowhere unital, nowhere self-consistent¹; it is everywhere communal, everywhere complicate, everywhere harmonistic. Indeed, Syncretism is by all odds the most conspicuous and impressive phenomenon it presents, a syncretism without a parallel in literature, unless in the Old Testament. In the latter the attempt has been made bravely and instructively, even if prematurely, to separate the components, to disentangle the "manifold wisdom" and distinguish the threads by colors. The time is not yet ripe for such an essay in the New Testament, but we may be sure that more than the seven primaries will be needed. The widely varying testimony of the manuscripts greatly complicates the problem, while lending some aid in its solution. Perhaps it may be well to illustrate the state of the case by a few examples. Let us pass by such long familiar facts as the omission or varying position of the paragraph anent the Adulteress (John vii, 53—viii, 11), or the absence of the conclusion of Mark (xvi, 9-20), and many others, and fasten our eyes on the more massive fact that the variations in Acts are so extraordinary and

omnipresent that the great master, Friedrich Blass, has been driven to the assumption of two originals, an α -text and β -text. The remarkable peculiarities of the Bezae Codex (D) had been noted by F. A. Borneman as early as 1848, but critics did not follow him in regarding it as presenting the older text; its eccentricities were ascribed to the copyist, who, like the villain in the play, was thought capable of anything. Tischendorf, Westcott-Hort, and Weiss base their texts of Acts essentially on B N A C. It remained for Blass to show that this D was only one of many witnesses to a distinct Occidental text very widely ramified. It was as when one tugs mightily at some exposed root of a tree: the earth begins to stir everywhere on that side of the tree. Blass was led to think that two manuscripts proceeded originally from Luke, one a memorandum (or draft) which he himself filled out into a book (the α -text or Antiochian form) for Theophilus. The draft, he thinks, remained as the β -text, at Rome, where it was elaborated into the Occidental text (*forma romana*). This theory of Blass has not maintained itself; it is naive at many points, and it wrecks on many textual and other facts; but it has proved extremely valuable as bringing clearly to light the systematic differences of the manuscripts and showing how a critic with ultraconservative leanings (Blass dates Acts from 57-59 A.D.) is yet forced to the assumption of two primitive texts. Let one citation indicate the interval between them.

Acts xxvii, 1 (α -text): "And as it was determined for us to sail unto Italy, they were delivering both Paul and some other prisoners to a centurion by name Julius, of the Cohort Augustan."

(β -text):

"So therefore the governor decided for him to be sent to Caesar, and on the morrow, having summoned a certain centurion of the Cohort Augustan, by name Julius, he delivered to him Paul with the remaining prisoners."

It remains to add that Blass has found it necessary to distinguish two texts, α and β , in Luke's Gospel as well as in Acts.

The criticism of this eminent philologist, though not quite attaining the goal proposed, may be said to mark the beginning of the end of well-meant efforts to reconstruct the unital autographic originals of the New Testament Scriptures. The notably complex character of these latter comes out daily more and more clearly. The Baurian criticism had left the Apocalypse and the four chief Paulines as the primary and irresolvable literary records of the Apostolic Age, by which all others were to be measured and appraised. Of this sacred pentagram it was the analysis of Völter and Vischer that dissolved the first corner. These critics, especially the latter, have exhibited the Apocalypse as primarily a Judaic composition, itself highly composite, which has been interpolated and Christianized by one or more Christian hands. The still deeper digging of Gunkel, Bousset, Zimmern and Jeremias has brought to light a considerable amount of exceedingly primitive, even Babylonian, mythical material which had been cast into the alembic of the Apocalyptic. On the other hand, the extremely complex character of 'Romans' has come clearly into evidence. Spitta has found it

¹ Unless, perhaps, in the unicapitulars, as Philemon, Jude, 3 John.

necessary to break it up into two Epistles; the great Lightfoot, while rejecting the crude attempt of Renan, found himself constrained to propound a theory of a Shorter Recension. Völter surrendered the unity unconditionally, and Van Manen the Paulinity in his elaborate work on *Paulus*, though he had defended it against Loman. Steck also in his widely read and very readable *Galaterbrief*. More piercing was the analysis of Pierson and Naber in their remarkable *Verisimilia*, which in spirit and principle is the most advanced of European critical productions. Independently of the foregoing, and following other methods, the present writer has exposed the concretionary structure of Romans in a series of monographs, with sufficient clearness. It can hardly be doubted that similar results await the application of similar methods to Corinthians and Galatians. Indeed, it was said years ago in the *Theol. Jahresb.*, "The 2 Cor. Letter will no longer hold together."

In Romans the presence of a large body of ancient Judaic originals seems now made out. The conservative, J. Rendel Harris, perceives that the list of sins (Rom. i, 29-31) is based upon an ancient Jewish Vidui (Confession for the day of Atonement).¹ The same must, of course, be said of the similar list in 2 Tim. iii, 2-5. The searching analysis of Spitta and Massebieu shows clearly that the Epistle of James is almost wholly Judaic, Christianized by a few insignificant interpolations.

The problem of discovering the original elements, often Jewish, of the New Testament compositions, has been propounded only recently and has not yet advanced far toward solution. But the progress already made is most encouraging. That way lies truth — of this the day for doubt seems gone forever.

Closely connected with this quest is another, for the sources of the Scripture quotations attributed to the Gnostics by the Fathers. Thus far it has been held unsuspectingly that the Gnostics quoted from our Canonics or from parallel, still later sources. Inasmuch as the matter is of fundamental importance, it has appeared well to the writer to subject it to a minute and exhaustive investigation, which should include primarily Hippolytus, Irenæus, Tertullian, and Clement of Alexandria. As a result of this investigation, though not yet completed, it may be declared that no evidence has yet come to light that the Gnostics ever used our Canonics; on the contrary, it appears certain that the Gnostics derived largely from sources now lost but certainly presenting much of our present 'canonic' matter in a cruder, more primitive, less elaborate form. By every token these sources contained this matter in far more natural connection than it appears in at present. The new light that is thus thrown upon the anharmonies and asyndeta of the New Testament is often surprising. The transformations are often complete and effected in queerly ingenious manner. We now begin to feel the force of the oracle in Matt. xiii, 52: "Every scribe disciplined for the kingdom of the heavens is like unto a householder that brings forth from his treasure things new and things old." A few examples must here suffice. In Matt. xiii, 3-9, Mark iv, 3-9, Luke viii, 5-8, we read the Parable of the Sower. In Matt. xiii,

19-23, Mk. iv, 14-20, Luke viii, 11-15, it is carefully expounded. The seed is declared to be "the Logos of God," the Sower is not interpreted, but is left to be understood of the Jesus or indeed of any preacher of the Gospel. Critics, even the keenest, as Koetsveld, Jülicher, Bugge, have never yet been able to satisfy even themselves concerning the interpretation, still less concerning the expressed design of the parables, to blind the hearers. Jülicher declares this latter to be impossible, especially for Jesus, and puts the dilemma sharply: "Either the Evangelists or Jesus." No solution is found in the New Testament, but on turning to Hippolytus (*Philosophumena*, v. 8) we find given as a "saying" of the oldest pre-Christian Gnostics, the Naassenes, the following *Allegory of Creation*: "Forth went the Sower for to sow: And some fell by the wayside and were trodden down; and some upon the stony places and sprang up (he says), and through not having depth were withered and died; and some fell (he says) upon the earth the fair and good and made fruit; some a hundred and some sixty and some thirty. Who hath ears to hear, let him hear." . . . Here the Sower is none other than God himself; the seed is the Logos, the *spermatic Logos*, the seminal Reason of the Stoics; the three classes are the elsewhere familiar Choics, Psychics, Pneumatics (all known to the New Testament), otherwise named the Captives, the Called, the Chosen. (A paper read by the writer before the Society of Biblical Literature and Exegesis, New York, 28 Dec. 1904; "Der vorchristliche Jesus," 107-135).

In the Gospels the phraseology has been expanded and enlivened, the Hebraism "in his sowing" (*ἐν τῷ σπέρσειν αὐτοῦ*) has intruded itself from the Lucan source, a 4th class has been inserted in the 3d (by Justin in the 2d) place, and the application made is entirely new.

In Matt. vii, 13, 14, we read the famous exhortation as to the gates: "Enter ye in by the narrow gate: for wide (is the gate), and broad is the way, that leadeth to destruction, and many be they that enter in thereby. For [how] narrow is the gate, and straitened the way, that leadeth unto life, and few be they that find it." The passage is quite unconnected with its context; there is never any hint as to interpretation; it is a mystery even to Zahn; it is impossible in its present setting. But in Hippolytus (op. cit., v, 8) we find the Eleusinian doctrine of the two gates: the one into the lower common life of flesh and soul, through which all enter at birth, the other into the higher life of spirit, through which only the initiates may fare; then is given as a saying of "the Saviour" the following: "Concerning these (he says) expressly hath spoken the Saviour, that narrow and straitened is the way that leadeth into life, and few are they that fare in into it; broad though and wide the way that leads unto destruction, and many are they that thorofare through it." The doctrine of the "Two Ways" was a favorite of antiquity but no nobler interpretation than this has yet been found. It must not be supposed that the use of the term "The Saviour" (*ὁ Σωτῆρ*) presupposes the Gospel or Christianity. The word is not a New Testament favorite, occurring (save in Luke i, 47, ii, 11, Acts v, 31, xiii, 23) only in the so-called later Scriptures (19 times, 6

¹ *The Teaching of the Apostles*, pp. 83-87.

times in Titus); it has been shut out, then, from the Gospel tradition, perhaps as a current heathen designation of gods or even kings. With the Gnostics it was greatly preferred, while the Fathers substitute for it the name Lord (*Kύριος*, *Dominus*). Its Greek use goes back at least to Æschylus and Pindar, and in its technical sense it was pre-Christian. The battle-cry of the Greeks at Cunaxa was "*Zeus Σωτήρ καὶ Νίκη*" (Xen. Anab. I, 8, 16).

Again, the doctrine of judging the tree by its fruits finds large space in the Gospels. Thus Matt. vii, 16, "Do they gather grapes from thorns or figs from thistles?" and Luke vi, 44, "For of thorns they gather not figs, nor of bramble harvest grapes." Here is an excellent answer to the oft-recurring question, which of two or more forms is the original? Plainly, both—and neither. They are variants upon an aphorism repeatedly met with in the classics. Says Plutarch, "We do not expect the vine to bear figs nor the olive clusters," *οὐκ ἐκ τῆς ἀμπελὸς σκα φέρειν οὐκ ἄξιον μὲν οὐδὲ τὴν ἐλαίαν βότρυς* ("De Tranquillitate Animi," XIII (472, F). Ovid, too, 'Aro Amatoria,' I, 747.

*Siquis idem sperat, jacturas poma myricas
Speret: et in medio flumine mella petat.*

"If any hopes this, let him hope tamarisks will bear apples, and let him search for honey in the river's mid."

These classic parallels suggest the important question: How much of the New Testament exists under other form in profane literature? The question has not yet received complete answer, which could hardly fail to prove very illuminative.

From all of the foregoing it appears that we must not judge the New Testament by the same standards we apply to the products of individual genius. It is the life of ages and of whole peoples that is concentrated in that volume. It is the gradual precipitate of the moral, religious and philosophic consciousness of three and a half centuries—a time and two times and the dividing of a time—that is stratified in that wonderful book. To this slow deposit nearly the whole circum-mediterranean region would seem to have made contribution. Certain it is that Rome and Athens and Ephesus and Antioch and Alexandria will bear honorable mention by the side of Palestine and Jerusalem, not yet to include Persia and India.¹ It is the mighty Mother, it is Universal Humanity, that has brought forth this prodigious birth through the long travail of a third of a millennium.

The new aspect under which the critical problem now appears effects a remarkable transvaluation of values. The great critical movement may be said to have begun, ineffectually to be sure, in the great year 1792 with *The Dissonance of the four generally received Evangelists, and the evidence of their respective authenticity examined*. By Edward Evanson, A.M.—Ipswich. Evanson was bold enough to reject Matthew, Mark and John, along with

many of the Epistles, for reasons never sound but not always unworthy of serious attention. Of course, he held the spurious Scriptures to be later in origin. In 1820 'Probabilia de Evangelii et Epistolarum Joannis, Apostoli, indole et origine eruditorum judiciis modeste subiecti Carolus Theoph. Bretschneider.' The author concludes at the end of 224 well-reasoned pages that the fourth Evangelist was "certainly neither John the Apostle, nor a companion of Jesus, nor a Christian sprung from Palestine and living there, nor a born Jew, but some other Christian skilled in Alexandrine doctrine, a presbyter (as he himself professes in later epistles), who in writing it (exarando) made use of both tradition and a written book. Most probably he lived in Egypt." The author, who so modestly submitted this book to the judgments of the learned, afterward still more timidly recanted; nevertheless it brought "eternal honor to his name." His arguments were repeatedly answered in detail, hardly in their entirety. But before and beside these two negative judgments as to the sources, there had spread itself an all-embracing skepticism as to the miraculous contents of the New Testament story. In the hands of the English Deists it took the form of mere mockery, of contemptuous denial or disproof, with little or no attempt to understand them genetically, and beyond this stage it has in many cases not advanced even to this day. But the tenderer, more sympathetic, German spirit sought earnestly to interpret the miraculous narratives, to show how they arose, to make clear what forms of religious consciousness had produced them. In this striving there was a possible basis for a steadily progressive intelligent critique and ultimate understanding of the New Testament, while in the brutal English negation there was none.

This German Rationalism had not gone to such alarming lengths without deadly violence no less to the spirit than to the letter of the sacred narratives, but it had been so insidious as to have remained almost unconscious of itself. It was Strauss who in his 'Leben Jesu kritisch untersucht' (1835) rather roughly tore away the mask and showed the "very Age and Bodie of the Time, his forme and pressure." But the criticism of Strauss touched almost solely the contents of the Gospels, the profounder question of the sources it did hardly moot. Hence there was not only place but imperative call for Baur and the Tübingen School, with whom New Testament criticism in the more modern sense may be said to have begun.

The influence of their penetrating researches was clearly seen a generation later in Strauss' second 'Life of Jesus for the German People' (1864), less so in the brilliant romance of Renan, 'La Vie de Jésus,' in which keen sympathy, lively fancy and perfect style vainly strove to supply the place of exact scientific criticism. Meantime another great voice in theology, Albrecht Ritschl's, had in his 'Entstehung der altkatholischen Kirche' (1857) openly renounced the Baurian two-term formula, Paulinism versus Petrinism, as unequal to the expression of the facts of early Christianity, and had founded the Ritschlian School, whose leaf even in the fifth decade is still green.

Practically all of this high argument, stretching through 70 years, has turned upon questions

¹ For Persia the monumental work of Cumont is fundamental and exhaustive. Leaving aside the surmises and parallels of Seydel and Hopkins ("Christ in India," in his 'India Old and New,' 1901), compare the circumspect dissertation of Van den Bergh van Eysinga, 'Indische invloeden op oude Christelijke verhalen' (1901), and articles by Oldenberg in the *Theologische Literaturzeitung* and the *Deutsche Rundschau*. Consult Edmunds' "Buddhist and Christian Gospels" (1905).

of date and authorship. The gravamen of the Tübingen contention consisted in referring the bulk of the New Testament to the 2d century and construing it as pseudepigraphic and in some sense born of the Paulo-Petrine controversy, reflecting it, or solving it, or smoothing it away. On the other hand, the Conservatives, largely aided by Ritschlians, held more or less firmly to the traditionary first century dates and authorship and minimized the antagonism between Jewish and Gentile Christianity.

All this has now been greatly changed. Dates and authors are not indeed unimportant, but they are no longer of prime significance. This follows at once from the principles already enunciated. If these much-debated compositions be really so highly compounded, then their dates and authors are not precisely determinable. Even if it were possible to discover the ultimate or the penultimate reviser, the question would remain as to the extent of his own contribution to the final whole; the fact that he wrote 150 A.D. might very well consist with the fact that some or most of his material appeared even in written form 150 B.C. Thus the units of the New Testament compound seem dissolving under our hands like an atom of radium, but without apparent loss of energy. With this regard the large enterprises of such as Volkmar and Zahn and Hilgenfeld are alike turned awry. At the same time, from this higher viewpoint we can see the partial justification of opposing theories, the half-truth in each term of the contradiction. Radicalism has been right in detecting indications of late origin in many or all of these canonic Scriptures; Conservatism has been equally right in emphasizing the presence of more far older elements. But neither the one nor the other has been justified in any inference from one part to its neighboring part, much less to the whole. Side by side in the faulted and folded strata of a mountain range we may find fossils separated by many thousands of years. Though the apocalyptic prophecies of Mark xiii be written before the catastrophe of Jerusalem, nothing follows as to the rest of the Gospel, which may have been written much later. Why may they not have been written at least in part, a hundred years earlier? They are not foretelling a second coming, but only *The Coming* of the Son of Man. Again, even if part of the parallels in Matthew and Luke do presuppose that catastrophe, which quivers still here and there in Matthew (Harnack, Chron., p. 654), it remains none the less true that these vivid pencillings may be only later touches of a revising hand. The body of the picture may still be generations older. In studying these Scriptures we are exploring the tossed ruins of a world, and each fragment must stand on its own merits. Questions then of age and authorship must still present themselves continually, but not under the old familiar forms.

There are two elements in the New Testament that are especially subject to considerations like the preceding: the philosophic, or rather theosophic,¹ and the gnostic. These are present in large measure, even in portions mainly personal and narrative. With respect to

both it seems reasonably certain that the age is often very great. The theosophic doctrines repeat themselves under endlessly varying forms in Gnosticism. This latter phenomenon is now referred with increasing positiveness and definiteness to the first Christian and even pre-Christian century. Its wide-reaching roots stretch themselves away back into the alluvium of the Tigris and the Euphrates (see Anz, 'Ursprung des Gnostizismus'). As an offshoot or outgrowth or "acute secularization" (Harnack, D. G., I, 232) of Christianity, it is wholly inconceivable. The great historian of dogma himself annuls his own contention by recognizing a boundless extent of *Vorstufen* (op. cit., p. 226, 231 f.) for his secularization. These prestiges were confessedly pre-Christian, or at the very latest syn-Christian, and since they contained demonstrably and indisputably in this form or in that nearly the whole body of New Testament theosophism and much more, it follows irresistibly that the derivation of Gnosticism from Christianity is in every sense impossible. The two historical products were practically synchronous; since many of the Gnostic central thoughts were certainly centuries pre-Christian, it may be possible to regard Christianity as emerging from Gnosticism, but it is surely impossible any longer to regard Gnosticism as diverging from Christianity. To this general state of case there is explicit testimony in the book of Acts in chapter viii, 9-24, where Simon Magus is represented as an elder contemporary of Peter and Philip. The first preaching of the Gospel in Samaria found him already preoccupying the ground, for many years he had been amazing the Samaritans, proclaiming some doctrine about the "Power of God, that called Mighty," which we know to be a Gnostic slogan. Now this Simon figures in the Fathers as the well-head of Gnostic heresy; and it was both the habit and the dogmatic necessity of the Fathers to post-date, never to predate, the Heresies. Harnack admits the historicity and antiquity as well as the epic grandeur of Simon's attempt at universal religion. Strangely he regards this heresiarch, who had at the first preaching of the Cross for a "long time" been so omnipotent among the Samaritans as to be considered by them a god — this precursor of Peter he regards as a "counterpart to Jesus" (Gegenbild zu Jesus). That Simonism was the elder is clearly indicated in Acts viii, 13, where Simon accepts the preaching of the Gospel, believes, is baptized and attaches himself devotedly to Philip *προσκαρτεροῦν* (τῷ Φίλιππῳ). The close affinity of Simon's preaching with Peter's is unmistakably hinted in the disclaimer of Peter (viii, 21), "There is not for thee part or lot in this Word." Moreover, we know from Origen (C. Cels. V, 62) that *Simonians* was, at least with the Gentiles, one of many names for Christians. This is not nearly all, however. We learn from Hippolytus that Simon was far from being the fountain-source of Gnostic heresy, at least of Gnosticism. He appears as only fifth in the chronological list. The first, antedating Gnosticism itself, and only later called Gnostics, are the all-important Naassenes, whence all the rest (Hip. Phil. v, 6). Compared with Naassenism, Simonism is visibly and palpably a much later development. Hence Naassenism is thrown back beyond the begin-

¹ But we speak divine wisdom (θεοῦ σοφίαν) in mystery, 1 Cor. ii, 7.

ning of our era. There is no evading this argument *a fortiori*; witness the utter bewilderment of Bunsen in his *Tabulation* ('Hippolytus and his Age,' I, p. 236), where he says the Gnostics (Hip's, I-IV) originated 70-99 A.D., but the later Simon belonged to the first age (27 to 65)!! With this early dating, and only therewith, do all the phenomena correspond. Now in this archaic pregnosticism we find already present, however inchoate, a goodly company of the most important and characteristic New Testament ideas: the Son of Man (Humanity=*bar-nasha*), the Man from Heaven, Citizen of Heaven, the Father, the new Jerusalem, the Choics, the Psychics, the Pneumatics, the Captives (Luke iv, 18; Rom. vii, 23), the Called, the Chosen, the Perfect, the Spirit, the new Birth, the Christ, he Jesus—all of these and more march in proud procession through the pages of Naassenism. The name *Jesus* for the Son of God is used in one of their hymns, which we have no reason for supposing post-Christian, being Harnack and Preuschen declare to be "ein naassenischer jedenfalls alter Psalm" ('Die Ueberlieferung und der Bestand der alchristlichen Literatur,' p. 168).

The momentous fact confirmatory is that all these notions are used in the New Testament as perfectly familiar, needing no explanation. This presupposes that these notions already had a history lying behind them. We may be perfectly sure that they had been formed and defined and bandied about in frequent discussion long before they became encysted in apophthegms of the earliest Christian literature.

With respect to the gnomic element the case is quite as strong. The starry words of the New Testament are evidently stones that have been polished to perfection by the attrition of ages. That this literary peculiarity is due to the personality of Jesus cannot be maintained. For since he must have spoken in Aramæan, not in Greek, the forms we have could be only translations. As reproducing words actually used by him, the renderings of Dalman and others have little value. Jesus and the Baptist are thought of as strongly contrasted, almost antipodal; but the style of the one is hardly distinguishable from the style of the other. Both denounce the Pharisees as "generations of vipers" (Matt. iii, 7, xxiii, 33), both use precisely the same words about the Tree and the Fire (Matt. iii, 10, vii, 19). The variations found in the synoptic reports are precisely what might be expected in such anthologies. Let any one compare corresponding proverbs in sister languages or even different forms in the same language, for example, as given in Bartlett's 'Dictionary of Quotations,' and he will find almost exactly the same phenomena presented.

At this point the recent papyrus finds, with their new 'Sayings of (the) Jesus,' are of striking interest.¹ Clearly they are but *dissecta membra* of a once imposing organism. Such Logoi (not Logia) undoubtedly existed in that elder day in countless number. Oblivion has swallowed them up, as it has swallowed up so much of ancient literature. Here and there some few have escaped and are seen *rari nantes in gurgite vasto*. The salvage of our canonic

is like the Seven Tragedies of Sophocles—7 out of 80! We may rejoice, however, in the belief that what has survived is the best—not all of it the best, nor all of the best,—but on the whole the most worth saving. The Christian consciousness has sifted and resifted, has tested the spirits whether they be of God; it has polished and refined, has set and reset the precious stones, until the great citadel of its faith gleams and flashes like the bejeweled gates of the New Jerusalem.

Examples of the long-continued process of perfectionment lie open to behold in our Gospels. Thus, in Luke vi, 17 the Jesus descends into a plain and teaches a great multitude eagerly pressing upon him. But in Matt. v, 1 he withdraws from the multitude into "the mountain" (of new legislation) and teaches "the disciples" only. In Luke vi, 20 he declares, "Blessed the poor, for *yours* is the kingdom of God"; but in Matt., "Blessed the poor *in spirit*, for theirs is the kingdom of the heavens." In Luke, "Blessed they that hunger now, for *ye* shall be filled"; but in Matt., "Blessed they that hunger and thirst for *righteousness*, for they shall be filled." In Luke, "Blessed they that weep now, for *ye* shall laugh"; but Matt., "Blessed they that mourn, for they shall be comforted." So, too, Matthew omits the "Woes" in Luke, supplying other beautiful beatitudes. That the Lucan form is older and has been immensely spiritualized in Matthew is too plain for argument, though it is not affirmed and not probable that Matthew has derived directly from Luke. Notice, too, that "they that mourn," "the meek shall inherit the earth," "they that thirst," "the pure in heart" are all Old Testament gems (Is. lxi, 2, Ps. xxxvii, 11, Is. lv, 1, Jer. xxxi, 24, Ps. xxiv, 3, 4) gathered into a new brilliant. Compare also Ps. cix, 28, cxxvi, 5, 6 for the Lucan contrasts of weeping and laughing, cursing and blessing.

The primary form of the angelic song (L. ii, 14), it is now admitted, was "Glory on high to God, and on earth peace among men of (His) good will," that is, His people Israel. Surely it is not hard to forgive the scribe who, by the omission of a single letter, *ε*, of the last word, transformed it into "Glory on high to God, and on earth peace, among men good will."

Once more, the zenith of moral sublimity, before which Rousseau justly exclaimed, "Socrates died like a philosopher but Jesus like a God," is attained in the prayer on the cross: "Father, forgive them, for they know not what they do." Nevertheless, it is now bracketed by Lachmann and Westcott and Hort as a "Western" interpolation. Finally, mark how the Lord's Prayer as given in Luke (xi, 2-4) has been expanded and ennobled in Matthew (vi, 9-13).

Such examples, which may be multiplied indefinitely, may teach us how erroneous it is to suppose that the extra-canonic "Sayings" are less primitive, because less perfect in form and substance; on the contrary, their comparative crudity far more reasonably argues their comparative originality; "first blade, then ear, then full corn in the ear" (Mark iv, 28).

We come now still nearer the heart of the matter. In most of the foregoing we may hope for the general concurrence of critics, save such as Nösgen of Rostock. Few of the enlightened

¹ The formula "(The) Jesus says" seems to stand on precisely the same footing as the Old Testament parallels, "Thus saith Jehovah," and the like. Against Soltau.

would now deny that the general mind of "the Church" has been largely formative of our present Scriptures. The more advanced would concede that it has even taken an active part in shaping the canonical "Biographies" of Jesus. The recent powerful and convincing work of Wrede admits no doubt on this point. Hear some of his emphasized conclusions: "To write a Life of Jesus meant for Mark not to report something about Jesus, it meant rather quite simply to narrate a life full of Messianic manifestations" ('Das Messiasgeheimnis in den Evangelien,' 1901, p. 125). Again, p. 129: "The evangelic research of to-day proceeds throughout on the supposition that Mark in his historical narrative has the actual circumstances of the life of Jesus before his eyes, approximately distinctly, if not uninterruptedly. It presumes that he thinks outward from the Life of Jesus, that he motivates the individual features of his history according to the real circumstances of this life, according to the real thoughts and feelings of Jesus, that he concatenates in historic-psychologic sense the events that he sketches. In accord herewith it interprets, and in accord herewith it criticises the Gospel in detail. It assumes, to be sure, chronologic displacements, inaccuracies as to fact, alterations in the verbiage of utterances ascribed to Jesus, also an addendum of later dogmatic conception. But yet it operates everywhere with the psychologic necessities and probabilities that held for the personal actors in the given situations, it motivates in accordance therewith, it supplements the accounts with the consequences that flow therefrom naturally, and so covers with flesh the skeleton of dry dates. *This view and this procedure must be recognized as false in principle.* It must be said openly: *Mark has no longer any conception (Anschauung) of the historical Life of Jesus.*"

This is certainly one of the most important deliverances of recent criticism. The characterization of the prevailing investigation of the Gospels is perfect, but it is unfortunate that Wrede has contented himself with a bare negation, however unshakably established. "Herewith I will by no means prejudge the historic character of the materials, which I have not investigated. These materials may here be disregarded entirely" (p. 129). The same prevalent attitude has been clearly stated by Pfleiderer, though in much broader outline, when he declares with Strauss (against Ullmann) "the Christ of the Gospels is a creation of the faith of the church, but this faith is an effect of the person of the historical Jesus." Again, "Historical science, which is concerned to understand Jesus as the originating source of Christianity," Harnack, while strenuously maximizing the trustworthiness of the Gospels in *der Hauptsache*, admits that, "however, here and there are mirrored even in them the conditions of the original community and the experiences through which it passed in later times" (p. 15). In other words, the later apostolic Christian consciousness transfigured more or less the primitive "Life of Jesus." Harnack would perhaps use still stronger language after reading Wrede. So we might go on quoting Feine, Bousset, Weiss, Keim, Jülicher, Holtzmann, Weizsäcker, Gunkel, Meinhold and the rest. Enough. The transforming activity of the

early Christian consciousness they do not deny; how high it is to be rated is yet unsettled; but after Wrede's work it will never again be rated so low as before.

Nevertheless, all these critics up to this time are harmonious on one point, however discordant as to others; they will all agree with their great spokesman, Pfleiderer, that the end and aim of the historical science of the New Testament "is to understand Jesus as the originating source of Christianity." How seriously historical science has taken this problem is above all evident in the great number of works, by men of first-class ability and intensely in earnest, bearing the title *Life of Jesus* or *Life of Christ*. 'Das Leben Jesu' was the title of the great apocalypse of David Friedrich Strauss. Since then we have had Renan's, and Keim's, and Weiss's, and Hase's, and Holtzmann's and Réville's, and the like, not to mention Farrar's, and Geikie's, and Edersheim's. Even Volkmar, who, in his 'Marcus,' had, along with Hoekstra and Loman, broken the path since trodden by Wrede, resolving so much of the biography into symbolism, *Lehrgedichte*, and the like, even Volkmar must yet write his, *Jesus Nazarenus*, sounding often like a recantation.¹ More than one of these works was of signal ability. Keim's was pre-eminently able. But even where no formal 'Life' was written, if the writer attempted any construction or interpretation of primitive Christianity, it was uniformly in terms of the Personality of Jesus. The consciousness of the Christ — that was the oldest Christianity, and, barring the acknowledged imperfection of the means and agents of transmission, that was the content of the Gospel as to us transmitted.

Here at least there is nothing in debate. Surely the problem has been clearly and definitely conceived; it has been firmly and resolutely grasped; the materials for solution are not lacking in abundance; the expenditure of the widest, deepest, exactest learning, of zeal and abilities of the highest order, has been prodigal, and the methods employed have been infinitely varied; — what then, we may and we must ask, has been the net result? The answer can not be doubtful: absolutely *nil*! There is no exaggeration in this statement. Thus far it has been found utterly impossible to rationalize the Life of Jesus. Certain negative critical results have obtained more or less general recognition in critical circles, but they do not, however, apparently, help us in the least "to understand Jesus as the originating source of Christianity." On the contrary, they tend rather to make such understanding less and less possible. The theories developed in such capital works as Pfleiderer's 'Das Urchristentum,' or Harnack's 'Das Wesen des Christentums,' or Heinrich's 'Das Urchristentum,' or Réville's 'Jésus de Nazareth,' or McGiffert's 'The Apostolic Age,' or the cognate treatises of Schürer, Hausrath, Weizsäcker, Votaw and others, though lasting monuments of erudition, though brimful of

¹ A like remarkable refluence of critical consciousness made itself known in Loman, the Tiresias of the North, especially in controversy with Scholten. These keen critics, beside whom must be named their unhappy master, Bruno Bauer, had strange forebodings, extraordinary glimpses of the truth — they saw visions, they dreamed dreams. But their glittering structures lacked the solid foundation of scientific fact. No wonder then that they have sunk in a heap.

ingenuity and sagacity, though widely illuminative and always pressing out further and further the bounds of our knowledge—all such are none the less disappointing as regards the capital point. In the last resort they are all equally impotent to make the Christian movement comprehensible or credible as an emanation from a personal focus, as a reaction from the Life and Death of the Man Christ Jesus. We might illustrate this fact by abundant citation, but there is no need to carry owls to Athens. Not one but must in the end beg the whole question, must abdicate the whole task, by assuming some uniqueness in this Personality, some absolute disparateness and incomparability with all other humanity. In other words, when under their inexorable analysis every trace of the miraculous¹ has vanished alike from Gospels and Acts, from Epistles and Apocalypse, there remains unshaken in tremendous majesty the one supreme Miracle of Miracles, the Heart of Heart in the New Testament, without Whom all other miracles are vain and contradictory, with Whom they acquire consistency and awful significance. The crumbling away of these outer parapets but lifts aloft into still bolder relief the impregnable strength of this inmost citadel.

The case then stands thus:

If Jesus be such a unique Personality as everywhere demanded by critical theory, in last analysis incomparable with the sons of men, then He was in some sense superhuman, it makes no difference in what sense, and neither His words nor His deeds are to be measured by the standard of men. Hence His miracles, one and all, remain miracles but cease to be wonders. We know of no reason why He should not have been born of a virgin, and walked on the waves, and raised the dead, and ascended into heaven, and endowed His disciples with any desirable spiritual gifts, and transmitted the Power of the Keys to an endless series of infallible viceregents. Nay, it becomes antecedently highly probable that He would and did do all this and much more; we should reasonably expect such a unique extra-natural being to do unique extra-natural things. We have no ground at all, then, for extruding or slurring or minimizing the non-natural element in the Scriptures, but every ground for retaining and accenting and even magnifying it. Accordingly, the strictly orthodox view appears alone consistent and rational, the liberal theology must ultimately commit suicide, however skilfully it may postpone the dénouement to the last page of the last chapter. The unescapable question, "What think ye of the Christ?" must sooner or later precipitate the catastrophe. Greatly then as we admire and applaud the most enlightened scholarship of Europe and America, we must admit that at this critical pivotal point it has no standing before the bar of logic. This yea-and-nay criticism has now for years been bankrupt.

When so many wingéd hounds of Zeus thus find that their quarry forever eludes them, the suggestion is inevitable that there is something radically wrong in their method of pursuit, that

in some way their finest sense has betrayed them. We hold that the nature of their error is now at length an open secret. They have sought to explain Christianity as an emanation from a single individual human focus, as the reaction upon history and environment of a single human personality, they have sought "to understand Jesus as the originating source of Christianity"—they have failed and they must forever fail: for no such explanation is possible, because no such origination was real. Over against all such attempts we oppose the fact that every day comes to clearer and clearer light, that now flashes continually into evidence around the whole horizon of investigation, the fact that was perceived nearly a decade ago, but whose effective proclamation called for the publication of a series of preparatory investigations, the fact that the Genesis of Christianity must be sought in the collective consciousness of the first Christian and immediately pre-Christian centuries, that in the Syncretism of that epoch of the amalgamation of faiths, when all the currents of philosophic and theosophic thought dashed together their waters in the vast basin of the Roman circum-mediterranean empire, was to be sought and found the possibility and the actuality of a new faith of Universal Humanity, that should contain something appealing to the head and the heart of all men, from slave to emperor, a faith in which there should be no longer male and female, Jew and Greek, bond and free, but all should be one by virtue of a common Humanity of the ageless, timeless, spaceless Son of Man.² It is only as the outcome of this Syncretism, as the final efflorescence of the Judæo-Greco-Roman Spirit, of the Asiatic-European Soul, that Christianity is wholly intelligible and infinitely significant; the notion that it is an individual Palestinian product is the *Carthago delenda* of New Testament criticism.

That the drift of the most advancing thought and the most penetrating research is all in the direction indicated, can not escape the notice of the reader of the most recent works of such as Pfeiderer, Gunkel, Bousset, Zimmern, Heitmüller, Dieterich, Seeberg, Wrede, Kreyenbühl, Usener, and their peers. Such is the unmistakable trend of historico-religious investigation. But this latter is very slow, and naturally very slow, to cut loose from the ancient moorings, to weigh anchor and commit itself to seas entirely unknown. Thus even Gunkel hesitated long ("nach langem Zaudern und manchen Erwägungen") before publishing his 'Zum religionsgeschichtlichen Verständnis des Neuen Testaments' (1903). He has therein spoken out bravely the great word (p. 95), "Christianity is a syncretic religion," even as Bousset had already declared: "Judaism, however, was the retort in which the different elements were assembled" (Rel. des Judentums, p. 493).³ Nevertheless, Gunkel tells us "*all this has been transferred to Jesus*," "When then Jesus appeared in his superhuman sublimity," and it avails little to add "that the christologic problem of the present is not merely historic and can not be solved in purely historical way"; so that, after all, we are advanced hardly an

¹ Even criticism in the bosom of the Church of England spares now but two or at most but four of the miracles: The Incarnation and the Resurrection, with their "incidents," the Virgin Birth and the Ascension. Consult the controversy in 'The Nineteenth Century and After.'

² *ὁ υἱὸς τοῦ ἀνθρώπου* = Bar-nasha = Human Being.

³ Most characteristically Bousset adds: "Then resolved through a creative miracle the new formation of the Gospel."

inch beyond the elder standpoint. In the same spirit Wernle declares that "Paul's utterance concerning Jesus was at bottom a myth, a drama, to which Jesus gave the name" (329). None the less, Wernle still deduces Christianity from this uniquely but merely human Jesus.

The amazing state of case, then, is this: The most piercing criticism detects nearly the whole body of Christian doctrine and practice in the mixed religions of the day, even the sacraments themselves. None of this, it feels sure, "can be derived from the teaching of Jesus; they show us how Christianity in its infancy was drawn into the chaos of Oriental religions" (Wernle). Nevertheless, it assures us that this teaching, *this* Jesus, remains the heart's core of Christianity. When now we ask, what then was this teaching, what this Personality? the answer rendered is arbitrariness itself. Since the critic feels constrained to explain 99 per cent of Christian theory and practice as derived from Judæo-pagan sources, as merely "transferred to Jesus," he is at liberty to choose the remaining 1 per cent as he will; he makes of the teaching precisely what he thinks it ought to have been, he declares Jesus did or did not teach this or that, because it conforms or does not conform to his idea of Jesus! But whence this idea? Certainly not from the Gospels, for these are saturated through and through with "transferred" elements; the only one that professes to be based on personal knowledge, the Fourth, is exactly the one that is rejected *in toto* as history, even by such a conservative critic as Harnack ("Especially the Fourth Gospel . . . can not be used as an historic source in the ordinary sense of the word"—D. W. d. C., p. 13)! No standard, then, is left but the caprice of the critic; he makes his own Jesus and conforms the Gospel thereto! If the Gospel contains contradictory or superfluous elements, they have been imported from the surrounding "chaos"! If it omits certain necessary or desirable features, it was because the religious consciousness of the writers was not free to assimilate them, but was bound fast by the historical conditions that obtained! It is plain at a glance that nothing can ever come of such criticism, where the "poverty of the ascertained historical materials" is turned into endless imaginary wealth by "the uncontrolled power of combination and divination" (Pfleiderer). The focus, the burning point of investigation, must then be this *Personality*, which is thus the irresolvable residuum of the most inexorable analysis. But we may be absolutely sure that nothing can ever come of the arbitrary methods in vogue, all of whose airy constructions of the "Nazarene"

"Are but dust that rises up
And is lightly laid again."

Against every such theory of a unique deified Man, still more against the recent crudities of Kalthoff (Jesus merely a social-ethical Ideal!), while expressly holding important collateral questions in abeyance, it seems that criticism must now explicitly postulate the *aboriginal Godhood of the Centre of Christianity*, as appears at least from these considerations:

1. The mere human Personality, which each critic postulates according to his own convenience, makes no great figure in the early propaganda. Neither in the book of Acts, nor in the

Epistles, nor in the oldest extra-canonic literature, can the keenest eye detect the after-effect of "the Carpenter," his words, his deeds, his life, his death; the Jesus, the Christ is everywhere conspicuous, towering like the Matterhorn, but everywhere supremely as an object of worship, as an over-earthly supernal Being, as a God (*The Outlook*, 66, p. 686 f., 1900). The greatest early preacher, The Apostle, apparently cared little or naught for the earthly history of Jesus and preached him solely as a Divinity. When Harnack and the rest talk of "the impression that he made upon his disciples and which they propagated," they forget the Pauline injunction not to be wise above what is written. Certainly, any such human Person as they assume must have made and left a regulative, overpowering and ineffaceable impression; the fact then that no such impression at all is anywhere discernible, but quite the contrary, must teach us to revise their assumptions.

2. The preaching of "the Jesus" was seemingly pre-Christian. We have already mentioned the occurrence of the name and the idea in "an ancient psalm of the Naassenes" (Harnack), which we have no right to regard as post-Christian. It also occurs repeatedly, at least four times, in the 'Zauberpapyri' lately brought to light, especially at line 3120 of the great Paris Papyrus edited by C. Wessely, in a long "Hebraic Logos" which shows no trace of Christian influence, which is expressly attributed to "the pure men," and which the great master, Dieterich, positively ascribes to the (pre-Christian) Essenes. At line 3119-20 we read ὁρκίζω σε κατὰ τοῦ θεοῦ τῶν ἑβραίων Ἰησοῦ . . . "I adjure thee by the God of the Hebrews, Jesus."

As the end of controversy on this point we cite Acts xviii, 25, where of the learned and eloquent and zealous Apollos of Alexandria it is said, "He was wont to speak and teach accurately the doctrine of the Jesus (ἐλάλει καὶ ἐδίδασκεν ἀκριβῶς τὰ περὶ τοῦ Ἰησοῦ), knowing only the baptism of John." The phrase italicized excludes all possibility of biographical reference to the Jesus of the Gospels, and shows incontestably that the cult of the Jesus was fervently propagated far and wide in ignorance of any earthly Life of Jesus.

3. The Epithet "Nazorean" (Ναζαρηαίος, Ναζωραῖος, Ναζαρηνός) is not derived from Nazareth, a seeming topographic fancy, but is a divine appellative derived from the Old-Semitic stem NaSaR, meaning to keep, guard, preserve, frequent in the cuneiform inscriptions (na-ša-ru) as far back as 2250 B.C., constant in the Old Testament, where Nōšrim means *watchers*, precisely the term by which the Talmud designated the Christians (NaZoReans). The epithet Nazorean would mean then *Servator*, almost the same as *Salvator* (Jesus), which are both used to render the Greek Σωτήρ. The Syriac form Našaryā suggests, but does not prove decisively, that the termination refers to the divine name Yah. So that Našaryā would mean *Servator*—Yah. Consult *The Monist*, January 1905, pp. 25-45, "Der vorchristliche Jesus," 42-70.

4. The "Našaraioi" were certainly "before Christ" and "knew not Christ," to quote Epiphanius (Pan. Haer. xxix, 6). The name is the same as Našaryā (Syriac for Nazarene) and indicates that they worshipped God (Yah) un-

der a particular aspect or *Person*, namely, as Protector, Preserver (N—S—R). The notions of Servator (*Nasap*—*αὐός*) and Salvator (*Ἰσῶς*), being hardly distinguishable, we naturally get the double title Jesus Nazarean. The fusion of this notion of *Saviour* with the more orthodox notion of *Messiah* (Chrestos)¹ gave rise to the slogan of Paulinism, *the Jesus—the Christ*; this fusion was perhaps distinctively the work of Paul.

5. *Primitive Christianity seems not unifocal but multifocal in origin and development.* It does not emerge full-fledged at Jerusalem and encompass the Mediterranean with the flight of an eagle. The "astoundingly swift" (Heinrici) spread of the Gospel seems only apparent. In reality it seems everywhere in the air, a divine contagion. It springs up almost simultaneously in Jerusalem, in Antioch, in Damascus, in Alexandria, in Rome, in Crete, in Libya, in Ephesus, in Corinth—wherever in the Dispersion the seed was sown. The book of Acts makes two attempts to explain this multifocal fact in accord with its own unifocal theory. It assembles at Pentecost "in Jerusalem, dwellers, Jews, devout men from every nation that is under heaven," who, "each one in his own dialect, heard them (the Apostles) speaking." The other is found in the mighty persecution that arose against the Church in Jerusalem after Stephanos was crowned with martyrdom. "All were dispersed except the Apostles." But these were really the only or at least the principal offenders, the very ones that would have been dispersed first of all. Immediately after, the Church had peace, was builded up and multiplied (Acts ix, 31), and, not many years after, the believers in Jerusalem number many myriads, all zealous for the law (Acts xxi, 20). The fact of multiplicity is clearly implied in these abortive attempts to trace it back to a higher unity. The other evidences are strewn through the book of Acts; they are scattered and broken lights, but gathered up and focused by the lens of criticism they glow with surprising brightness.

These results, set forth and grounded in 'Der vorchristliche Jesus' (1906-11), were reinforced and greatly extended in 'Ecce Deus' (1911-12), in which it was maintained ('Zweifellos mit Recht'—M. Dibelius in Harnack's 'Theologische Literaturzeitung') that:

6. Proto-christianity was a protest against idolatry, a crusade for Monotheism, the "Eternal Gospel," "Fear God and give Him glory" (Rev. xiv, 6, 7), and as such swept round the Mediterranean in triumph. It was also held that:

7. Primitive Christianity was esoteric, heard in the ear, and only later proclaimed on the housetop.

8. Its language was largely parable and allegory and expressive symbols, representing the pagan world as a leper or blind or lame or deaf or even dead, or still more as possessed by demons (which symbolize heathen gods), and most pathetically as a sinful (adulterous) but repentant woman.

9. In the Gospel, sin is pre-eminently idolatry with its attendant vices; repentance is return "from the polytheistic error," and faith is the belief in and the worship of the one true God.

Around these positions there has raged (since 1911 at least, till the outbreak of the World War) a very lively strife and there has grown up an extensive literature mainly in continental Europe, without, however, making any large addition to our knowledge. By odds the most notable volumes are the 'Kyrios Christos' of Prof. W. Bousset, reviewed in the *Monist* under the title 'Polyxena Christiana,' and the 'Agnostos Theos' of Prof. E. Norden, both of which, under disguise of "controversy," go far toward confirming the positions enumerated.

This later conception of Proto-christianity lifts it entirely out of the domain of mere morality into which the well-meant liberalism of the 19th century had sunk it, and restores it, under wholly new auspices, to its elder rank as the greatest, and in its central aspect, the final religious revolution of the ages.

So far the investigation has been carefully made, and so much appears "very probable." Still other kindred inquiries are in progress, but of these the results must be awaited. Enough, however, seems established to show that the "hopeless confusion" of Rationalism, in its century-old essay to interpret Christianity from the *Man Christ Jesus* as the assumed sole human personal animating centre, must remain forever confused and hopeless, for no such interpretation can ever be correct. On the contrary, this most interesting and most important of all historic phenomena is comprehensible and must be comprehended as a total product of the totality of historic-religious-philosophic-ethic conditions prevailing around the Mediterranean, as a phenomenon which itself came not with observation, so that no man could say "Lo here!" or "Lo there!" but which emerged to view from the fermentation of three centuries and lightened like the dawn of a polar day round the whole horizon from the East even unto the West. This prodigy, this heir of all the ages, appeared at first under many forms, with many slogans and battle-cries, of very varying degrees of worth. It was the work especially of the second century to rally the straggling and sometimes contending arrays under one banner, to select and unify and communicate what was best in each, and to reject and excommunicate what was bad or irreconcilable. The organic result was the Old Catholic Church—as its name implies, the *totalization* of a host of originally more or less independent elements. Here, however, we are brought to the borderland of theology, and here we must pause, for that border we dare not cross. Many important consequences seem to present themselves naturally, but these must be left for the reader to recognize. If the deep-eddying stream of criticism, whose swift descent we have followed through the century, has now at last surmounted and surpassed every bulwark of tradition, we need only reflect that it is a cleansing and a fertilizing flood, the river of the waters of life, which has been poured abroad over exhausted fields, and that

¹The earlier form, see Blass *Gram. & nt. Gr.* § 27, 4. Compare also Ps. xxiv, 8, quoted by Clem. Alex., *Adm. in Genl.* 56 C. Syll., "taste and see that Christos is God," where the Septuagint has *Chrestos* (good) is the Lord.

²As is proved by microscopic scrutiny of Acts.

the inundated plains will blossom and brighten anew with abundant blessing.

Tulane University, New Orleans.

NEW TESTAMENT CRITICISM.

Triple Evidence.—Logicians distinguish between metaphysical, physical and moral evidence for the things we know. Metaphysical evidence is based on the unchangeable essences of objects or on the analysis of our concepts; for example, the whole is greater than its parts. Physical evidence is based on the conditional stability of the laws of nature; for example, the sun rises in the east and sets in the west. Moral evidence is based on the testimony of a witness; it implies that we have the genuine words of the witness, and that the witness is endowed with the necessary knowledge and veracity. The New Testament does not furnish us either metaphysical or physical evidence; we have to be content with moral evidence. And even this is not of the highest order. We do not listen to the words of eye-witnesses, but we have only a number of historical and doctrinal writings to consult. Again, we do not possess a single autograph of these writings; our New Testament text has been copied and copied again, edited and edited again, so that at present not a single verse reads exactly alike in all copies and editions. The very words of our witnesses seem to have become uncertain. Moreover, doubt has been raised as to the knowledge and the veracity of our New Testament writers; their evidence has been pronounced unreliable even in those passages in which their words are practically certain.

Criticism.—For these reasons the principles of criticism must be applied to the books of the New Testament. Lower or textual criticism

will inquire into the genuineness of each verse and of every word of the New Testament. Higher criticism will investigate the authenticity of the entire New Testament books, and will test their reliability. Meanwhile, let not the metaphysician and the scientist under-rate the evidence furnished by the New Testament writings. It is the evidence on which history is built; even the abstract thinker is content with this kind of evidence as soon as he leaves the region of speculation and enters into practical life.

Lower or Textual Criticism.—Lower or textual criticism strives to restore the original text of the New Testament. Its method consists generally in a reversal of the process by which false readings have penetrated into the text. The original readings are suggested partly by the ingenuity of the critic, partly by the text of early manuscripts or of patristic quotations or again of early versions.

Original Manuscripts.—The original copies of our New Testament books must have been lost very early. No early Father appeals to the original manuscript in defense of his own peculiar reading of the text. Tertullian (de præscript. 36) and Peter of Alexandria (de pasch. vii; Migne, P. G., xviii, 517, 520) are no exceptions. Tertullian's words concerning the Pauline Epistles do not necessarily imply the existence of the original copies; and Peter's testimony is based on late authority. Neither can it be said that a fragment of Mark's original Gospel is still kept in Venice (Baron., Annal. ad ann. 485), and that the copy of Matthew's Gospel written by Barnabas is still extant in Constantinople (Assem., Biblioth. orient., ii, pp. 81 ff); for both relics are spurious.

Early Variations.—Some of the early ecclesiastical writers are of opinion that the New Testament text was corrupted intentionally by the heretics. This view is expressed by Irenæus (c. hæ. i, 27; Migne, P. G., vii, 638), Dionysius of Corinth (Eus., H. E., iv, 23; Migne, P. G., xx, 388 ff.), Tertullian (c. Marc. v, passim), Eusebius (H. E., v, 28 Migne, P. G., xx, 516), and Epiphanius (hæ., xlii, 9 ff.; Migne, P. G., xli, 708). We do not deny that heretical writers may have introduced one or another variant, but they cannot be held responsible for the great bulk of different readings. Nor are we at a loss to account for the early appearance of variations. (1) Oral tradition was prized higher in the earliest time of the Church than the written word. (2) The dogma of inspiration was not sufficiently well developed to demand a special amount of accuracy on the part of the copyists. (3) Most copyists did not work as official scribes of the Church, but transcribed the text for the use of private persons. (4) It must also be kept in mind that the scientific accuracy of later days was not a characteristic feature of the first centuries. (5) Finally, the copyists were fallible men, and as such they were not exempt from the various sources of accidental error to which all scribes are subject.

Earliest Witnesses for Variations.—Among the earliest witnesses for the existence of variants in the New Testament text must be reckoned Polycarp, Hegesippus, Papias, the Elders of Irenæus, Justin, Theodotus, the churches of Vienne and of Lyons, Marcion,

Ptolemæus, Heracleon and Tatian. Nor can the variants, for the existence of which they testify, be regarded as mere accidental slips of memory. Polycarp's quotation of Acts ii, 24 (ad Philipp. 1, 2) disagrees with nearly all Greek codices and early visions, but it agrees with cod. D, the Vulgate, and several other versions. The double reading of this passage must then have existed even in his day. Irenæus (adv. hæ. 30, 1; Migne, P. G., vii, 1203) appeals to ancient and accurate manuscripts in defense of a certain reading. Clement of Alexandria, too (Strom. iv, 6; Migne, P. G., vii, 1252), cites variants of certain passages. Various readings must therefore have been quite common in the 2d century. In the 3d century Origen complains of the great diversity in the codices (in Matt. xv, 14; Migne, P. G., xiii, 1293), and during the course of the 3d century Jerome attests that the evil grew rather than diminished (ad Dam., præf. in evang.). After the 4th century the occurrence of variants is attested by existing manuscripts, patristic quotations and faithful translations.

Incipient Stability.—It has been believed that Origen was the author of a revised text of the New Testament. But this opinion can hardly be reconciled with Origen's own words (in Matt. xv, 14; Migne, P. G., xiii, 1293). On the other hand, many learned men did not consider it below their dignity to aid in the transcription of the sacred text. Eusebius and Jerome (H. E. VI xxxii, 3; de vir. ill. 75) testify that Pamphilus had transcribed certain texts. Jerome again (ep. 34; al. 141) tells us that the priests Acacius and Euzoius had been engaged in transcribing the sacred text in the library of Cæsarea. In other passages Jerome shows his esteem for the manuscripts written by Adamantius and Pierius (in Matt. xxiv, 26; in Gal. iii, 1; Migne, P. G., xxvi, 181, 348), the latter of whom was one of Origen's successors in the presidency of the Alexandrian school; but neither Jerome nor Eusebius can be cited as a witness for a text revision by either of Jerome's favorites (cf. Eus. H. E., vii, 32; Migne, P. G., xx, 732). True text revisions appear to have been edited by the Egyptian bishop Hesychius and the Antiochian priest Lucian. It is true that Jerome's words (ad Dam., præf. in evang.; de vir. ill. 77) are not as clear and definite as one might desire. Still they show that Hesychius and Lucian had paid considerable attention to the problem of the New Testament text. Hug, Eichhorn and W. Bousset have ventured to suggest that the work of Hesychius has been preserved in the so-called Alexandrian group of New Testament variants, while that of Lucian is variously connected with the Byzantine or the neutral group. But no proof for either view has thus far been advanced. It cannot be denied, however, that from the 4th or 5th century onward the variants in the New Testament crystallize into several types or forms, differing according to the country in which the respective manuscripts were written, the versions were made and the citations were employed.

Causes Which Effectuated the Stable Text Groups.—We have said that the different groups of variants were more or less attached to their place of origin. But loyalty to the customs of particular places was not the only cause of the incipient text stability. The following considerations will suggest additional reasons:

(1) The local ecclesiastical authorities naturally insisted on having the transcriber copy the text current in each particular Church. (2) After the Church began to enjoy the blessings of peace under the reign of Constantine, the bishops had better opportunities to regulate the interior affairs of their respective dioceses (cf. Sozom., H. E. i. 11; Migne, P. G. lxxvii, 889). (3) Owing to Diocletian's decree concerning the destruction of sacred books, many copies of the New Testament had been destroyed during the late persecution, so that the number of the model texts was greatly reduced (Eus., H. E. viii, 2; Migne, P. G. xx, 745). (4) Finally, the Emperor Constantine charged Eusebius with the transcription of 50 new codices which were donated to the various imperial foundations and thus became the model text for innumerable other copies (cf. Eus., Vit. Constant., iv, 34, 36, 37; Migne, P. G. xx, 1181 ff.). Here we have an explanation of the fact that the so-called Syrian or Byzantine group of texts attained such an overwhelming popularity.

The Written Text from the 4th to the 16th Century.—Though from the 4th century onward the particular churches had their own peculiar groups of variants which they propagated in preference to other readings, it must not be imagined that the lines of demarcation between these text-families are mathematically accurate. Suppose we denote by 1 the text peculiar to the Church A, by 2 that current in the Church B, by 3 that peculiar to the Church C, etc., then the text peculiar to the Church Z will not be entirely new, but in all likelihood it will be a mixture of 1, 2, 3; and the text of the Church Y will be a mixture expressed by 3, 2, 1, and similarly the text of the Church X will be the mixture of 2, 1, 3. And while the codices were thus propagated, fairly faithful reproductions of parts of the text were kept for us by Eusebius, Athanasius, Epiphanius, the two Cyrils, Basil, the two Gregorys, Chrysostom, Theodoret and Ephræm. To these illustrious men must be added Andrew of Cappadocia for the 5th century, Venerable Bede, John Damascene and Alcuin for the 8th, Photius for the 9th, Suidas and Arethas for the 10th, Theophylactus, Ecumenius and Euthemius for the 11th and 12th, the Correctoria for the 13th and Laurentius Valla for the 15th. And this is by no means an exhaustive list of men and works important for textual or lower criticism.

New Testament Codices.—Greek manuscripts are divided into uncials and cursives or minuscules. In uncial writing all the letters are large and divided. The other class of manuscripts is called minuscule, because its letters are small; it is called cursive, because its letters are linked together in a running hand. Broadly speaking, the manuscripts written before the 10th century are uncials; those written between the 10th and the invention of printing (1454 A.D.) are minuscule or cursive. Not counting eight manuscript psalters containing the text of the hymns found in the third Gospel, the New Testament uncials number 114; two of these belong to the 4th century, 15 to the 5th, 24 to the 6th, 17 to the 7th, 19 to the 8th, 31 to the 9th, 6 to the 10th. But only one of all these contains the complete text of the New Testament; four others contain the greatest part of it. Besides these five, there are 81 gospel manu-

scripts (12 complete or nearly so, 14 partial ones and 55 fragmentary), 13 of the Book of Acts (five complete or nearly so, eight more or less fragmentary), five of the Catholic Epistles (four more or less complete, one fragment), 20 of the Pauline Epistles (seven more or less complete, 13 fragmentary). There are four complete manuscripts of the Apocalypse, and one defective one. Of the cursive manuscripts more than 1,200 contain the Gospels, more than 400 the Book of Acts, more than 500 the Pauline Epistles, more than 180 the Apocalypse. Besides, textual criticism knows more than 260 lectionaries with fragments of the Book of Acts and of the Epistles, and more than 950 evangelistaria, about 100 of which are uncial manuscripts. The investigation into the origin and the relationship of the various cursive manuscripts is far from being complete. To facilitate reference, the uncial manuscripts were denoted by capital letters, either Latin or Greek or even Hebrew, while the cursives were indicated by Arabic figures. H. Fr. von Soden has changed this notation considerably. On the list arranged according to this improved plan, not merely the identity of Soden's 2,328 manuscripts is indicated, but also their age and contents ('Die Schriften des Neuen Testaments in ihrer ältesten erreichbaren Textgestalt hergestellt auf Grund ihrer Textgeschichte'; Bd. i.).

The Printed Text.—It was in 1516 that Erasmus published the first printed edition of the Greek New Testament text. He based his work on six manuscripts at most; of these none was complete and only one valuable. New and improved editions of the Erasmusian text were issued in 1519, 1522, 1527 and 1535. Meanwhile, the polygot edition of Cardinal Ximenes, which had been prepared with much greater care and had left the press on 10 Jan. 1514, was published in 1522 (perhaps in 1520); but being limited to 600 copies, it never reached a large circulation. Not to mention other reissues of these two main editions, Robert Estienne or Stephanus repeated in his third and fourth editions (1550, 1551) almost the pure Erasmusian text, adding in the margin variants based on 15 manuscripts and the polygot of Ximenes. The English *Authorized Version* and the so-called *Received Text* current in England follow the third edition of Stephanus. His fourth edition is the first Greek text divided up into verses. Among its numerous re-editors, Th. Beza and the Elzevir Brothers deserve the first rank. The preface of the second Elzevir edition, which appeared in 1633, contains the words "*textum habes nunc ab omnibus receptum*." Hence the reprints of this text, and there are more than 170, are simply called the *Received Text*. In brief, then, the *Received Text* is the text of the second Elzevir edition, which appears to be a repetition of the Bezan text. This latter is the fourth edition of Stephanus corrected according to several notes of Henry Stephanus, some ancient versions and the Codex Claramontanus. In its turn, the Stephanus edition is a repetition of the fifth Erasmusian edition, and the latter is based on cod. 1 and 2 for the text of the Gospels, on code. 4 for the text of Acts, on cod. 7 for the Pauline Epistles, on cod. 1 for the text of the Apocalypse, in such a way, however, that the successive reprints of this highly composite text were slightly emended according to a few other text sources.

Critical Apparatus.—Robert Estienne (c. 1546) and Th. Beza (c. 1565) are rightly considered as the pioneer collectors of an apparatus for the textual criticism of the New Testament. Br. Walton (c. 1657) and John Fell also cooperated at the building up of such an apparatus, but they were far surpassed by Mill (c. 1707), who collected about 30,000 variants out of more than 100 sources. Bengel (1687–1752) first divided the various readings into groups. He distinguished between an African and an Asiatic or Byzantine type of variants. Semler (c. 1740) and Griesbach (1745–1812) distinguished three text groups: the former called his divisions the Alexandrian, the Occidental and the Oriental or Byzantine family; the latter named his groups the Alexandrian, the Occidental and the Constantinopolitan. Eichhorn (c. 1820) and Hug (c. 1840) agreed with Griesbach, but Scholz (c. 1850) returned to the double division into Alexandrian and Byzantine readings. Tischendorf (1815–74) acknowledged four different types of text, an Alexandrian, a Latin, an Asiatic and a Byzantine; Tregelles (1813–75) favored again a dual division of texts, naming them the Constantinopolitan and the Alexandrian group. Finally, Westcott and Hort introduced four text families: the Syrian, the Occidental, the Alexandrian and the Neutral. The Syrian text is the vulgate text in the Greek Church since the middle of the 4th century. It is supposed to be a revised edition of a pre-Syrian vulgate text. This latter exhibits three peculiarities: one group of its variants is remarkable for paraphrases, interpolations, amplifications and omissions; this text constitutes the Occidental group. Another group of variants is peculiar for its grammatical and scholastic emendations, and this is called the Alexandrian. A third set of variants, though pre-Syrian, shows neither the diffusiveness of the Occidental text, nor the nicety of the Alexandrian; it is, therefore, called the Neutral group. Now, since the Syrian text figures as the vulgate of the Greek Church after the middle of the 4th century, and since about a century must be allowed for the rise and passing away of the Occidental and the Alexandrian families, the Neutral type of variants must have been the common text during the course of the 2d century. But it cannot be maintained that these premises and conclusions are admitted by all textual critics.

Critical Editions of the New Testament.—

After the *Received Text* had become the current Greek text, it began to be regarded as quite sacred. Mill, Bengel and Wetstein collected various readings differing from the *Received Text*, but they did not dare to introduce them into the body of the New Testament. It was Griesbach who first changed the *Received Text* according to the authority of various manuscripts; but not even Griesbach had the full courage of his conviction. Besides, he was not acquainted with some of the oldest manuscripts discovered after his time (c. 1777). We need not delay over some of the less important editions published by Mace, Harwood, Matthæi, Alter, Scholz, Schott, Knapp, Tittmann, Hahn, Theile and others.

Lachmann (1793–1851) was the first who endeavored to construct a new text out of the oldest manuscripts known to him. Believing it impossible to restore the original text, he tried

to reconstruct the readings that had been current in the Church during the course of the 4th century. For this purpose he confined his study to a few of the oldest manuscripts, together with a few of the Fathers, and the best codices of the Latin Vulgate. He simply counted the authorities in favor of each reading and then followed the majority. Though the text thus prepared is far better than the *Received Text*, it is based on too small a number of witnesses, on too slight a knowledge of the few manuscripts actually used and on too mechanical a method of using them.

Tischendorf's services in the publication of manuscripts have probably done more to establish textual criticism on a sound basis than anything else. Besides, he published at least eight (according to another method of reckoning, 21) editions of the New Testament. It is to be regretted that he did not use his material more consistently and scientifically. Between 1841 and 1849 he differs considerably from the *Received Text*; between 1849 and 1869 he approaches quite closely to it; but after 1869 he again diverges from it. His last, or eighth edition (1864–72), still remains the standard collection of evidence for the Greek text. The prolegomena (1884–94) to this edition are the work of Gregory; they give an account of the manuscripts, the versions and the patristic quotations.

Tregelles (1831–75) published two manuscripts and collated many others with great accuracy, thus preparing his material for a revised Greek text. He based his edition exclusively on the most ancient authorities, but he used a larger number of them than Lachmann had done. Like his predecessors, he did not follow the principle of grouping in his new edition, so that the choice of his readings depends somewhat on personal preferences. Alford, Lightfoot, Weiss and others also have devoted a good deal of study to the New Testament text, but more with a view to its proper interpretation than its emendation.

Finally, Westcott and Hort have given us a new edition of the New Testament text based on the principle of grouping as explained under the preceding number. By adhering to the Neutral readings, they believe they reproduce the text current in the Church during the course of the 2d century. This edition has met with determined opposition, especially on the part of Scrivener and Burgon. These two scholars maintain that in the reconstruction of the Greek text all available authorities must be considered, and the most ancient must not be given the sole right of being heard. J. B. McClellan, too, based his English version of the Gospels (1875) on a revision of the Greek text, in which internal probability is taken as the most trustworthy guide in the selection between variants. Other good editions of the Greek text have been published by Weymouth, Gebhardt, Nestle, Bandscheid and Hetzenauer.

Recent Discoveries.—In recent years quite a number of discoveries have been made which have an important bearing on the textual criticism of the New Testament. The Arabic text of Tatian's 'Diatessaron' has come to light and was edited by Ciasca in 1888. The so-called second Epistle of Clement was discovered by Bryennios in 1875. In the last-named manuscript was also contained the Teaching of the

Apostles, but it was not made known till 1883. A fragment of the Gospel of Peter was discovered in 1886 by members of the French Archaeological Mission, who conducted excavations in the cemetery of Akhmim, in Upper Egypt. The Sinaitic Syriac manuscript was discovered by Mrs. Lewis and Mrs. Gibson in 1892, during their visit to the monastery of Saint Catharine, on Mount Sinai. Part of the Codex Purpureus was brought to light in 1896 in the neighborhood of Cæsarea. Finally, some Sayings of our Lord were discovered by Messrs. Grenfell and Hunt in 1896 and 1903 on the site of the ancient Oxyrhynchus, in Egypt.

Results.—Confining ourselves to general statements, we may derive the following conclusions from what has been said: (1) The material for the textual criticism of the New Testament is constantly growing. (2) In Mill's time the number of variants in the New Testament was estimated at 30,000; in 1874 Scrivener counted at least 120,000; Schaff stated in 1892 that they did not fall much short of 150,000. (3) There are more variants than words in the New Testament; in fact, there are about 20 variants to each single verse and they increase with each new discovery. (4) Lower criticism shows that we need not be alarmed at the number of these variants and that the substance of the New Testament is absolutely certain. (5) Dr. Hort, who is surely good authority in this question, tells us that "the amount of what can in any sense be called substantial variation . . . can hardly form more than a thousandth part of the entire text." (6) Kaulen enumerates only four passages in which the variants touch matters of faith: Mk. i, 1; Acts xx, 28; 1 Cor. xv, 51; and 1 Tim. iii, 16. But our faith is not affected by these variants; the revealed truth contained in these four passages is sufficiently certain from other texts of the New Testament. (7) Our classical scholars are satisfied that we possess the true text of those classical works of antiquity that have come down to us, though our knowledge of these works depends on a mere handful of manuscripts, while the manuscripts of the New Testament are counted by hundreds and even thousands. (8) The fact that our New Testament variants differ only in form, not in substance, excludes the hypothesis that it is the result of syncretism. The very defenders of this hypothesis seem to feel the difficulty; hence they declare that the New Testament presents "a syncretism without parallel in literature, unless in the Old Testament." (9) The number of manuscripts, of ancient versions, and of patristic quotations, is so great that it is practically certain that the original text of the New Testament is preserved in some one or another of these ancient authorities. This cannot be said of any other book of antiquity.

Higher Criticism.—The name Higher Criticism (q.v.) implies that it deals with problems more important than those of the textual or lower criticism. These problems are the questions concerning the integrity, the authenticity, the literary form and the trustworthiness of the various books. In the case of profane writings, these topics have been considered by a science called Literary Criticism. The higher critic ought to employ in his work not only the evidence of the literary work itself, but also external evidence that may be at his command.

The internal evidence comprises the style of the book, the views of its authors, allusions to past or contemporary events, geographical and chronological data, religious, moral and political principles, grammatical forms, lexicographical peculiarities; in fact, all the details that offer a solid basis for comparing the work under consideration with other literary products of the same period of time or by the same author. After all these elements have been considered, the actual work of comparison can safely be undertaken.

Faults of Higher Criticism.—We do not say that all higher critics are sophists, nor do we imply that sophistry occurs more frequently in higher criticism than in any other branch of human science; we wish only to point out some faults that higher critics have actually committed in their process of reasoning. (1) Many higher critics begin their work with a prejudiced or biased mind. While the orthodox inquirer cares very little whether he has to admit a supernatural fact more or less, and is therefore free to follow objective evidence, the unbeliever is pledged *a priori* not to admit any supernatural fact, seeing that a single fact of this kind would upset all his theories. If Christianity, they say, originated from Jesus, then he must have been superhuman. But nothing superhuman must be admitted at any cost. Hence Christianity must be considered as the syncretism of its age, the last efflorescence of the Judæo-Greco-Roman spirit. And all this vague terminology blinds them to the fact that this hypothesis involves a greater miracle than they have sought to avoid. (2) The higher critics often infer *a passe ad esse*; they imagine that a certain fact *can* be explained according to a given hypothesis, and forthwith that hypothesis is upheld as the only explanation. History and common sense may go against their inference, but all this cannot make them change their point of view; *stet pro ratione voluntas*. (3) The higher critics often change the degree of certainty of their contentions as they go along. First, something *may* be true; next, it is *probably* true; again, it is *certainly* true; finally, they actually refer back to their preceding statement with the words, "we have *proved* this to be so." (4) The argument of silence, too, has been highly favored by certain higher critics, though no regard was paid to the conditions under which alone this argument is of any value. (5) Again, higher critics are apt to pronounce judgment on topics outside their sphere of study. They claim to give an opinion on matters theological, philosophical, historical, scientific without the least hesitation; they even feel aggrieved if their criticism is criticised.

First Beginning of Higher Criticism.—The name higher criticism is of comparatively recent origin, but its principles are very old. In the last century before Christ, Dionysius of Halicarnassus won great renown by his critical acumen. In the early days of the Church, too, the books of Scripture were defended against the attacks of a Porphyry and a Celsus by men like Clement of Alexandria, Origen, Eusebius and Jerome by an appeal to the principles that are employed by our present-day higher critics. It is true that during the course of the succeeding ages our great Christian scholars were imbued with too great a reverence for the inspired books to subject them to

the critical process applied in the case of profane literature. Still, there were notable exceptions even to this rule. The introductory treatises to the Bible as a whole or to its several books were applications of critical principles. Richard Simon (1638-1712) applied the same in a pre-eminently masterful way in his famous work, *Histoires Critiques du Vieux Testament, du Texte et des Versions du Nouveau Testament.* The erudite works of Dom Calmet, too, give evidence of skilled critical inquiry.

The Age of Scoffers.—Though railery is no longer the equivalent of argument, it is instructive to review the attempts made to undermine the authority of the Scriptures by means of this weapon. Among the scoffers Voltaire holds a pre-eminent place. The tradition that he copied his difficulties against the credibility of the Bible out of Dom Calmet's works without either adding their solution or indicating his sources is too well known to need repetition. In his wake followed the French encyclopædists. A panegyrist calls Voltaire the king who succeeded Louis XIV, and who handed the royal sceptre over to Napoleon. Among his ministers figure such celebrated men as Diderot, D'Alembert, Buffon, Helvétius, D'Holbach, D'Argens, Lamettrie, Turgot, Condorcet, and in a way also Rousseau and Montesquieu. The king himself had learned his trade among the Deists of England, whither he was forced to withdraw in 1726, and where he remained for about two years. Cherbury, Toland, Tindal, Woolston, Collins, Bolingbroke, Chubb, Whiston, Shaftesbury, Whitey, Somers, Wharton, Shrewsbury and Buckingham figure among the principal apostles of English Deism.

Rationalism.—In Germany three forces had been at work to prepare the minds of the people for disbelief in the New Testament: First, the Wolfian philosophy had freed the mind from the strict letter of the Bible; secondly, the New Testament editions of Westein and Griesbach had shaken the readers' confidence in the inspired text; thirdly, Bengel and Crusius had modified the current notion of inspiration, insisting more on the active part of the inspired instruments than on their passive condition. The public was thus ready to appreciate Lessing's publication of the *'Fragments of Wolfenbüttel,'* the work of his deceased friend Samuel Reimarus (d. 1768). The first part of this work published in 1774 inculcated tolerance for the Deists; the second part appearing in 1777 was a general attack on revelation; the third part published in 1778 was directed against Jesus and his apostles, practically representing them as so many deceivers.

But this attack on the reliability of the New Testament was too brutal to become popular. Hence Paulus (1761-1851) proposed a hypothesis which removed the supernatural element from the New Testament as effectively as Reimarus had done, and at the same time saved the veracity of the inspired writers. In his *'Leben Jesu'* (1828) he distinguishes two kinds of supernatural elements in the Gospels; one kind is carried into the Gospels by the interpreters against the intention of the inspired writers; another kind is really intended by the sacred text. The former is removed by a proper method of interpreting the Bible; the latter must be regarded as the result of the subjective impression of the evangelists. They were rude,

uncultured fishermen and judged of the extraordinary phenomena in the life of their Master in a way that was neither scientific nor rational. In brief, according to Paulus, the writers of the New Testament are no longer deceivers, but they were incompetents.

The reliability of the New Testament fared still worse in the *'Leben Jesu'* published (1835, 1864, 1874) by Strauss (1808-71). He apparently saves both the veracity and the competency of the sacred writers, but he declares their work to be a mere collection of myths. The storm raised in Germany by this work is too well known to need further description.

Strauss had studied only the contents of the Gospels without paying due attention to the Gospels themselves. Ferdinand Christian Baur (1809-82) perceived this weak point in the work of his pupil, and endeavored to strengthen it. He believed that he had discovered the key to the history of early Christianity in the romance of the so-called Clementine Homilies. The opposition between Peter and Paul and their respective parties he traced back from these homilies into the books of the New Testament, in which the opposition between Petrinism and Paulinism was said to be either reflected or harmonized or again considered as past. Only the Apocalypse of John, the Epistles to the Galatians, to the Romans and to the Corinthians were admitted as genuine; all the rest of the New Testament was pronounced pseudonymous, and relegated into the 2d century. Here we have the tenets of the Tübingen school.

Anti-Tübingen Movement.—Baur made several vital mistakes in his assumptions: (1) His fundamental thesis concerning the great opposition between Paul and the other apostles cannot be proved (cf. Weber, *'Katholik,'* 1898, pp. 193 ff.; 1899, pp. 45 ff.). (2) Baur's preference for the four great Pauline Epistles was merely personal; subsequent negative criticism has not spared their genuineness (cf. Bruno Baur, *'Kritik der paul. Briefe,'* 1850-52; Steck, *'Der Galaterbrief nach seiner Echtheit untersucht,'* 1888; Pierson, *'Der Bergrede,'* 1878). (3) Baur was wrong in his utter neglect of early Christian tradition. The testimony of a Clement of Rome, an Ignatius, a Justin, a Marcion, an Irenæus and a Tertullian should not be set aside at the bidding of merely subjective considerations. Hilgenfeld, in his *'Historisch-kritische Einleitung in das Neue Testament'* (1875), acknowledged the genuineness of several New Testament books rejected by Baur; Reuss, in his *'Geschichte der heil. Schriften d. N. T.'* (1842), restores the origin of the whole New Testament, excepting 1 Pet. to the 1st century. Similar conclusions were reached by Ewald, B. Weiss, Hofmann, Schulze, Godet, Zahn, Harnack and other writers. On the whole, our most recent critics admit that early Christian tradition ought to be respected, and though the defenders of the general genuineness of the New Testament books encounter still strenuous opposition, as has been seen on the occasion of the publication of Zahn's *'Einleitung,'* they are no longer charged with lack of scientific method.

Syncretism.—There are critics who maintain that the striving to understand Jesus as the originating source of Christianity must prove abortive. They believe that "the most enlightened scholarship of Europe and America

has no standing before the bar of logic." The genesis of Christianity, we are told, "must be sought in the collective consciousness of the first Christian and immediately pre-Christian centuries; in the amalgamation of faiths when all the currents of philosophic and theosophic thought dashed together their waters in the vast basin of the Roman circummediterranean empire." But how can organic unity develop out of heterogeneity? How can concord develop out of discord and opposition? The material elements which compose the plant or the brute beast exist before either plant or beast begin to live; but who will imagine that a horse or a cow will be the result of the dashing together of their respective material elements? Moreover, Monsignor Batiffol (*Revue biblique*, January 1903) has shown that between 120 and 140 A.D. Marcion wrote a treatise proving that an opposition exists between the Law and the Gospel; at that early period, therefore, the Gospel was considered as possessing paramount authority. Again, Marcion appealed to Saint Paul in proof for the absolute newness and independence of Christianity. At Marcion's time, therefore, there existed a Canon of the New Testament books. And why should the faithful have esteemed the Gospels and the Pauline Epistles higher than the Epistles of an Ignatius, unless they were convinced that these canonical writings contained the exact teaching of the Master? The authority of Christ's word had preceded the authority of the canonical books.

What is Christ?—Higher critics distinguish between the Christ of history and the Christ of Christianity. Harnack, Wrede and Staerk may be said to simply rob Christianity of its Christ. Schmiedel, O. Holtzmann, Bousset and Schürer endeavor to link the Christ of history together with the Christ of Christianity, but their explanations are unsatisfactory. The Abbé Loisy, too, distinguishes a triple Christ; first, the views of Christ concerning himself; secondly, the faith of the early Christian community concerning Christ; thirdly, the Christology of the New Testament. And if you ask on what the faith of Christianity is based, if not on the facts of history, there will be as many different answers as there are writers. So that we rightly urge against our present-day higher critics the dilemma: Christ is either God, or what is He?

Bibliography.—A fairly complete list of the older literature belonging to this subject may be found in Reuss, 'History of the New Testament' (Vol. II, p. 367 f.); O. von Gebhardt adds to the preceding a fairly complete list of the pertinent literature down to about 1896 in his 'Urtext und Übersetzungen de Bibel,' which is a reprint of his articles on 'Bibel-text und Bibelübersetzungen,' contributed to the 'Realencyclopædie,' pp. 16, 54 ff. A reference to the contemporary literature may be found in the numbers of the *Ecclesiastical Review* under the heading "Recent Bible Study." Besides, the reader may consult Rose, 'Studies on the Gospels' (authorized English translation by Mgr. Robert Fraser, 1904); Lagrange, 'La Méthode Historique' (Paris 1904); Lagrange, 'Études sur les Religions Sémitiques' (Paris 1905); Chauvin, 'La Bible depuis ses Origines jusqu'à nos jours' (Paris 1903); Chauvin, 'L'Enfance du Christ d'après les Traditions Juives et Chrétiennes' (Paris 1904);

Chauvin, 'Le Procès de Jésus-Christ' (Paris 1904); Calmes, 'Comment se sont formés les Évangiles' (Paris 1904); Fonsegrive, 'L'Attitude du Catholique devant la Science' (Paris 1903); 'Jésus-Christ, Est-il resuscité' (Paris 1901); Chauvin, 'Histoire de l'Antéchrist' (Paris 1901); Chauvin, 'Au Golgotha' (Paris 1905); Méchineau, 'L'origine apostolique du Nouveau Testament' (Paris 1903); Méchineau, 'L'Autorité humaine des Livres Saints' (Paris 1903); Colomer, 'La Bible et les Théories Scientifiques' (Paris 1904); Saubin, 'La Synagogue Moderne' (Paris 1903); Vallet, 'Les Miracles de l'Évangile' (Paris 1905); Saubin, 'La Dogme Chrétien dans la Religion Juive' (Paris 1900); Saubin, 'Le Talmud et la Synagogue Moderne' (Paris 1900); Paulus, 'Les Juifs et le Messie' (Paris 1904).

ANTHONY J. MAAS,
Professor of Hebrew and Sacred Scripture,
Woodstock College.

NEW TESTAMENT THEOLOGY, that branch of theological science which has for its peculiar task to state, arrange and compare the theological doctrines and conceptions found in the New Testament. While it might be combined with Old Testament theology under the name Biblical theology, yet the differences in dates, language, style and contents between the Old Testament and the New are such that their respective theologies have usually been treated separately, although their methods are necessarily identical. It is also possible to state the doctrinal teachings and theological conceptions of any individual author and even those found in any single work of any author, and such contributions to Biblical theology have often proved exceedingly valuable; but the historic unity of the New Testament renders it practically important that the teachings and views of the various New Testament authors should be so presented and compared as to give but a single impression of the whole.

Character and Relations.—New Testament theology is strictly a historical science, neither attacking nor defending the conceptions which it finds, but merely stating, arranging and comparing them. As a historical science it is connected with Ecclesiastical History and might be considered the first volume of the History of Christian Doctrine. But it demands such a mastery of the results of the sciences of Isaagogs and Exegesis, on which it depends, that it is usually associated rather with interpretation, of which it might be reckoned the crown. It also presupposes and builds upon Old Testament history and the history of the world in New Testament times, and in its turn it provides much material for Dogmatics.

History.—The name Biblical Theology, which had earlier been employed to designate such a system of dogmatics as was based upon the Scriptures rather than upon either creeds or reason, was first used in its modern sense by Gabler in 1787, since which time the science in its application both to the Old Testament and the New has gradually developed. The first American work in the sphere of New Testament theology was published in 1870, and the first lectures in any American theological school are said to have been given in 1883. Since then it has received a steadily increasing amount of attention.

Difficulties.—The task of the New Testa-

ment theologian presents peculiar difficulties. It is impossible for him to increase the amount of the material with which he deals, however helpful for supplementing or verifying his conclusions such increase might be. All expression of thought is defective, and most of all is this true in theology, where upon words derived from the earthly and the human is laid the burden of declaring the heavenly and the divine. Further, the teachings to be considered come in a form due to ancient ages, tongues and conditions, and accordingly accurately and adequately to restate in modern form thoughts which have thus come down in ancient garb cannot be easy. Then, since with few exceptions the theological thoughts contained in the New Testament found expression solely for ends then immediately practical, it follows that the statements are often partial and incomplete, and the emphasis upon certain aspects of truth is only relative, and these statements must be read with constant reference to the thought of the age and the details of the local situation to which they belong. Hence only with difficulty can the incomplete expressions of practical religious thought be fitted together to reconstitute such systems of doctrine as may be credibly attributed to the various New Testament authors.

Grouping of the Books.—There is general agreement as to the grouping of the New Testament books according to the types of thought which they exemplify. The teaching of Jesus demands attention first, if not as a standard for the rest or as of superior authoritative-ness, as at any rate prior in time to the other New Testament teachings and as presupposed by them. The records of Christ's teaching are necessarily subdivided into the Synoptic and Johannine reports. The second group of documents represents the type of Christian thought which developed among Christians of Hebrew descent and consists of the first part of the book of Acts, the letters of James and Jude, the two letters of Peter (which, however, show that there had been a development considerably beyond the primitive conceptions current in the Church), and such traces of apostolic or other early doctrine as may be noted in the Gospels. In the Pauline section the Epistles attributed to this Apostle fall naturally into four groups, which differ in theme and matter as well as in date and style. If any of these letters should not be held to be Pauline in origin, they are yet so distinctly in harmony with Paul's views that this would not change their place in the general classification, while the Epistle to the Hebrews is a natural pendant to the writings of Paul. The fourth group of New Testament writings consists of the books attributed to the Apostle John, consisting of his letters, of so much of the Fourth Gospel as is not the teaching of Christ and of the Revelation.

Teaching of Jesus in the Synoptics.—In the Synoptic reports Jesus began his teaching by echoing the proclamation of his forerunner, John the Baptist: "The kingdom of heaven is at hand." While from the beginning of this preaching he seems to have recognized that he himself was to be the head of the promised kingdom, yet his own conception of the character and work of the Messiah was so different from the popular conception, so much loftier and purer, that he could not present

himself at once and unreservedly as the Coming King, for, had he immediately and unmistakably advanced his claim, political enthusiasm would have forestalled religious faith, and even on the part of true followers earthly ideals, expectations and plans would have obscured and neutralized heavenly, as, indeed, to some extent actually occurred in spite of caution and reserve. The name kingdom of heaven or of God, however, remained prominent throughout the teaching of Jesus, but in the latter part of it with an altered meaning. Convinced that he had nothing to hope from the leaders of the nation or the people whom they controlled for the kingdom of prophecy, which was intended to reach its spiritual ends through a local, national, political organization, Jesus necessarily substituted individual submission to the sovereignty of God, and retaining the name without the form, the kingdom which he strove to establish became in his teaching universal and spiritual.

While the state of individuals and society which he would establish thus took a new form in consequence of his rejection by his nation, the conditions of entrance, as well as the ultimate ends to be attained, remain unchanged. The first demand upon each and all is for repentance. As a morally transformed and thus fit nation should have met its King come at last, so only a soul turned from evil to good can receive the spiritual blessings which Jesus bestows. More and more clearly as antagonism gave renewed opportunity, Jesus denounced sin and demanded from all without exception penitence and reformation, although in serene consciousness of sinlessness he ever held himself apart from all confession of any evil on his own part.

With repentance as a reversal of moral tendency must come acceptance of himself as Supreme Master and absolute submission to him. His demand for self-denial is a demand for complete self-abjuration; his invitation, "Come unto Me," is not only an invitation, but no less the presentation of himself to the world as the one fountain of spiritual blessing; to receive him he says is to receive God himself, and personal service to him is regarded as proof of sins forgiven; devotion beyond all other loves is required, and so absolutely supreme is the relation of the soul to him that on confession or denial of him he makes the issues of the future life to hinge. This relation is made still more significant by the few but clear and emphatic teachings as to his death, by virtue of which as a ransom salvation would be rendered possible for men.

The fourth element in the teaching of Jesus which the Synoptists record relates to God. This teaching is almost never metaphysical, only religious and practical. The chief thought in it is God's love. This love, which exceeds that of any earthly father for his child, is shown in the rising of the sun on the evil and the good alike and the coming of the rain on both just and unjust, and in care for sparrows, ravens and lilies, and finds its crown of perfectness in kindness to the unworthy. The climax of this teaching appears in the parables about rescue of the lost, in the third of which, usually called the "Parable of the Prodigal Son," this tender love of God is so winningly presented that it has given a very common name

for the love of God, so that all Christ's teaching is said by many to be dominated by the thought of God's "Fatherhood," a view which should be so held as to include the other conceptions of Jesus as to God's special relation of fatherhood to believers and his unique fatherhood to Christ himself.

Teaching of Jesus According to John.—In the Gospel of John the teaching of Jesus is presented with a superficial dissimilarity at first sight striking, but in essential consistency with the Synoptic reports. As the place of the ministry reported is largely the city of Jerusalem instead of the open country of Galilee, as we have often hostile Pharisees for interlocutors instead of disciples for reverent auditors, so of the four chief elements of the Synoptic teaching, the Kingdom, Repentance and Faith, his own unique supremacy and the fatherly Love of God, the kingdom is scarcely mentioned, repentance is ignored and faith given a different aspect and the paternal kindness of God is much less emphasized, while Jesus insists even more upon his own pre-eminence and shows it in new lights.

The two foci of the teaching reported in the Fourth Gospel are, as might be expected from the author's own statement of his purpose as stated at the end of his writing, the deity of Christ and the duty of Faith. All the discourses in the Gospel are selected with a view to showing Christ's self-revelation to the world on the one hand and to his disciples on the other. While his Messiahship is not here emphasized, there is presented instead a conception of a sonship based on a unique unity with God, combined with hints of pre-existence, suggestions and implications of divinity and, finally, a welcome by Jesus to the assertion of his deity.

The proper relation on the part of his disciples, and, indeed, of all men, toward this personality who thus presents himself is not mere acceptance of statements about him and of truths relating to him, but further spiritual union with him by entering into relations to him, appropriation, in a word.

Judaic Teaching.—The earliest Apostolic teaching and the type of doctrine which seems long to have prevailed among the churches which were of Judaic origin and cast was only to a very slight degree dogmatic and brought on no enlarged or corrected doctrines touching the nature of God or the character of men. Indeed, no New Testament authors ever approach these themes as if intending to communicate fresh truth, but rather to confirm and apply truth already commonly apprehended. The chief thought of the primitive Church was the place and rank of Jesus, and here even the earliest teaching of the Apostles is developed in many respects beyond that of Jesus himself, a fact which is not surprising when it is remembered on the one hand that we cannot rightfully suppose that he exhausted the contents of his consciousness in even his frankest disclosures to his disciples, and on the other hand he himself promised that the guidance of the Spirit whom he would send from God would result in larger knowledge than his own instructions had brought. While the name of the kingdom is dropped at once and permanently out of use, at the same time the Messiahship of Jesus is asserted, and it is insisted

upon that by his coming forth from the tomb re-embodied, which was the resurrection to which his Apostles testified, his Messiahship and Lordship were fully confirmed. While it was constantly recognized that Jesus was no less man than other men, he was regarded as distinguished from other men, not only by his character of unique holiness, but also by his Messianic rank which gave him universal sovereignty and Lordship and, further, he was given the title Lord, which had been a familiar substitute for the most sacred of all the divine names. Theological discussions as to the nature, basis and conditions of salvation are not to be expected in such documents as represent Judaic Christianity, but it is plain that it was thought of as release alike from the consequences and the power of sin, provided, especially in the former aspect, by the death of Christ, and to be obtained by repentance.

Pauline Teaching.—The teachings of Paul are much fuller than those of the other Apostles, and in many places, owing to the doctrinal controversies which evoked them, they approach somewhat closely to dogmatic form, while such was the diversity of the occasions out of which the letters arose and of the situations of their first readers, that they cover nearly the whole field of Christian thought. Paul's conceptions of the nature and attributes of God, of his sovereignty and his love, and of the ruined condition of sinful men, while frequently brought out with great distinctness, were in no sense peculiar to himself. His special topics are, besides the rank of Christ, his saving work, the duty of man in relation to it and the activity of the Holy Spirit in completing it. While Paul implies a general knowledge of the life and teachings of Jesus, he looked to Christ as far transcending in nature and rank what might be inferred from these facts. In Paul's mind the unique fact of the resurrection of Jesus at once certified to his unique nature and relation to God and opened to him the way to supreme exaltation and universal dominion which would become fully his when he should return in glory to earth. He shared the divine essence; in his activities before his birth of a woman he created the universe and continues to uphold it, and to him worship is rightfully paid. The life and especially the death of Jesus were a part of the divine plan for the rescue of men from the state into which their sin had brought them. The death of Christ was clearly set forth by Paul as provided in the love of God as a basis indispensably prerequisite for the favorable treatment which he gives to every penitent: the blood of Christ was to Paul the ransom and propitiation by virtue of which redemption and reconciliation are secured for men. Paul was led by controversy to insist with peculiar urgency that Divine forgiveness and favor are conditioned on faith alone, that is, that salvation does not primarily depend on the behavior of a man, but on his acceptance of God's gracious gift, but while faith alone is the condition of entrance on the Christian's state, yet the Christian life in its ideal involves nothing less than the perfect performance of every duty and this ideal is practically attained only by the aid and power of the Holy Spirit, whom he regards as possessing personal, divine

attributes, who is imparted to every believer and permanently dwells in him.

Teaching of the Epistle to the Hebrews.—

The letter to the Hebrews makes no contribution of special novelty to the theology of the New Testament. While somewhat unlike the thought of Paul in that it presents the Mosaic system as helpful preparatory to Christianity which supersedes it, the views which it presents of the transcendent rank and sacrificial death of Christ are in fullest harmony with Paul's. That Christ is a "high priest," that is, a representative of men before God, and that faith is an unyielding grasp on the invisible, are thoughts which are peculiar to the author of this Epistle.

Johannine Teaching.—The teachings of John relate themselves proportionally more to God himself than those of any other New Testament teacher, but his conceptions of the deity, like theirs, are mainly dynamic and ethical, rather than metaphysical. His thought seems to sum itself up in three words, life, light and love, which suggest that God is the constant source of all power and joy; that he is spotlessly holy and tends unceasingly to manifest himself as such in and to his universe, and that his most central, essential and characteristic attribute is kindness and beneficence, unceasing and all-embracing. In the teaching of John the eternal Logos, or expression of God, became incarnate in Jesus, and thus presents God to men; and in turn by his death he became the "propitiation" in virtue of which forgiveness is promised on condition of penitence and confession. The privilege and duty of Christians is fellowship with God, that is, by refraining from all sin to share his spotless holiness.

DAVID FOSTER ESTES,

*Professor of New Testament Interpretation,
Colgate University.*

NEW THEOLOGY, a term which has come into general use since 1875 to designate a movement inaugurated by the faculty of Andover Theological Seminary and of which the principles were set forth in 'Progressive Orthodoxy' (1886). At present the term has acquired a wider and deeper significance, comprising that body of theological thought which seeks to embody in divinity the accepted results of modern philosophical thought and more especially seeks to co-ordinate the evolutionary theory with theological interpretation. The new theology, therefore, accepts evolution both in spiritual and material things, applies the methods of the higher criticism to the Bible, of which it rejects a verbal inspiration. Dogma cedes its place to ethics and sociological study and the miraculous is minimized or excluded altogether. The movement is general throughout Christendom, but there is much difference between its advocates and in general it might

rather be termed a tendency of theological thought rather than a school with fixed and avowed principles. Consult Campbell, R. J., 'The New Theology' (London and New York 1908).

NEW-THOUGHT, an idealistic or metaphysical movement in the United States, a direct successor of New England transcendentalism, but much more practical and democratic. The older idealisms were seclusive, but this one is preached and practised on the high-roads and carried into the minutiae of daily life, often assuming the forms of religion and philosophy. It boasts of being the greatest healer the world has yet seen and scorns the idea of being mere speculation. It is claimed that New-Thought will not create any new religion or creed and that it will not formulate any new system of metaphysics. As regards religions, it is said by the representatives of New-Thought, that they are not desirable, because they are based on will, not on thought, and because they demand obedience. As regards metaphysics, no system is wanted because life and thought cannot be confined in a system. The world needs illumination and freedom, not limitation.

The first apostles of New-Thought were P. P. Quimby of Portland, Me., Dr. W. F. Evans and their immediate disciples. The first preached it orally, the other by the pen. None of these, however, are its parents in any sense, nor are they quoted as authorities by any present-day followers or teachers. New-Thought is the modern expression of an inherent self-affirmation of the soul as old as the soul itself. New-Thought self-affirmation is intensely individualistic and has found its philosophy in Emerson's 'Self-reliance.' In the Emersonian extreme and in Tennyson's

"Self-reverence, self-knowledge, self-control,
These three alone lead life to sovereign power."

Ænone.

may be found its first principles. New-Thought people, however, identify the self with the "Oversoul" and commonly prefer to quote the Biblical "*I am* (that I am)" as their motto and foundation. The revealed secrets of the "*I am*" are to be read upon every page of their hundred and one serial publications. These "revelations" resound with mystic refrains of the Oriental *tat twam asi*, "That (namely the 'Universal Self') art Thou!" and they run into the high notes of Promethean self-deification and rebellion. "The Song of the Soul Victorious" is of freedom, of our being centres; of concentration and self-assertion, human divinity, ideal suggestion, the souls' prerogative to rule and of "vibrations" which are the redemptive forces of existence. In strong contrast and as a jarring note in this solemn and highflowing song one reads immediately afterward that the publisher does healing, "absent treatment, a specialty," at so much or so much per contract, if the reader promptly forwards the money.

New-Thought ontology teaches "oneness of life," that "all life is one," but the student searches in vain for any scholastic definition of these axiomatic teachings as also for the theological dogma "God is omniscient, omnipotent and omnipresent." This last, the omnipresence of God, is taught to the exclusion of all other attributes. The bearing of these two doctrines

leaves, however, no doubt about their being inherently pantheistic in character, and implying a pantheism in the direction of the Hegelian pan-logism. To New-Thought life, God and all other categorical terms are swallowed up by Mind or "the limitless self." New-Thought epistemology is in harmony therewith: "all knowledge is one," it declares with much force, but without argument, the popular understanding being that human knowledge is one with divine knowledge.

New-Thought is often confounded with Christian Science, but their difference can clearly be seen by their cosmology. The latter holds the Oriental doctrine that the world and its things are illusory, products of "the mortal mind," but New-Thought asserts the reality of the world and considers it an expression of God, the two being related as cause and effect. The central doctrines of New-Thought lie in psychology. They consist in asserting the supremacy of mind over all other energies and in identifying it with the perennial stream of energy which permeates existence at large. Our mind is identical with the supreme mind, it makes us what we are and creates our conditions and environment; by inherent love it overcomes all hatred, malice and sickness; by inherent law it establishes itself as the world's law and by inherent order it rules everywhere. It keeps itself alive in love, law and order by constant affirmation of itself: "I am, that I am!" In ethics, the New-Thought is of a decided optimistic tendency. Its program is the Emersonian "don't bark against the bad, but chant the beauties of the good." Evil is not real, but only an imperfection which illumination dissolves. New-Thought is not iconoclastic, but fulfils the ends of creation in "peace and good will." If others do not know Reality and only worship "an unknown God," New-Thought people do not think it right to use violence or even persuasion; growth and experience will bring truth.

New-Thought is intensely practical. It professes to heal sickness and to remove the sting of death. Sickness is error and is cured by right and wholesome thinking, and death is but a transition, a "passing out" into another condition. If we always stood fast in right thinking we should never die, but simply transform ourselves.

New-Thought "circles of healing" are very common. They are found in every State in the Union, and in most cities followers of the cult can be found. It is estimated they exist by the million. The cult and its teachings have spread to Australia, Canada, England and many places on the Continent, especially France and Germany. The circles are not churches, but "bethels" or "houses of thought" for instruction and meditations. Services on Sunday often begin with the singing of "Omnipresence, Omnipresence, Omnipresence, manifest Thyself in me!" by a few minutes of meditation for the concentration of mind before the discourse is given. Speakers are chosen without regard to creed or race, etc. Their main qualification lies in their experience of oneness with the Great All. At the circles, rooms are set apart for daily noon-hour meditation. In the rooms are also private classes for instruction, etc. The circles are maintained by voluntary contributions, but

no teachers, excepting private class teachers, are paid.

New-Thought healers are many, but New-Thought teachers are many more. Experience has shown that no man or woman can heal for more than a very limited period of their lives. When they can heal no more, they teach others the method. The methods of healing run through the whole scale of impressing the "new" thought by suggestion, hypnotism, faith or simple rationality. Healing is done also by "absent treatment" or telepathy.

A New-Thought convention was held in Chicago, 17-20 Nov. 1903, attended by many thousands. The following "progressive" declaration of principles was adopted:

1. The New-Thought is the new interpretation of universal and eternal Truth.
2. God — Universal Spirit, Mind, Principle — is omnipresent, omniscient and omnipotent.
3. Man is the individual expression of God, possessing inherently and capable of manifesting all the aspects of God.
4. Man unfolds to a continuously expanding consciousness and manifestation of these aspects, through right thinking and right living.
5. The consciousness of harmony is Heaven, here and now; in the realization of which abide peace of mind and health of body.
6. The essentials of the New-Thought are suggested by the words — Unity, Co-operation, Freedom, Brotherhood and Individuality.

Since then many attempts have been made upon forming a bond tying the various societies together. Many still stand apart, but *The International New-Thought Alliance*, with James A. Idgerton as president, has been formed and its purpose, as published in *The Nautilus* of November 1915, is as follows: "To teach the Infinitude of the Supreme One; the Divinity of Man and his Infinite Possibilities through the creative power of constructive thinking, and obedience to the voice of the Indwelling Presence, which is our source of Inspiration, Power, Health and Prosperity."

C. H. A. BJERREGAARD.

NEW ULM, Minn., city, county-seat of Brown County, on the Minnesota River, and on the Minneapolis and Saint Louis and the Chicago and Northwestern railroads, about 80 miles in direct line west by south of Saint Paul and 25 miles west by north of Mankato. It was settled in 1854 by a German land company, incorporated in 1870 and chartered as a city in 1876. It was the scene of an Indian massacre in 1862. A monument has been erected to the memory of those who fell in the massacre. It is in a productive agricultural region in which there is considerable attention given to stock-raising. Its chief industrial establishments are flour-mills, breweries, cigar factories, a creamery, a cooperage, machine-shops, a pottery, green-houses, organ works, electric appliance works, shirt factories, brick and lumber yards and grain elevators. It has an extensive trade in farm products and livestock. There are several churches, and the educational institutions are public and parish schools, Dr. Martin Luther College, Saint Michael's Academy, a public school library and the Turnverein Library. The banks have a combined capital of over \$200,000, and the annual business exceeds \$15,000,000. The government, under a revised charter of 1891, is vested in a mayor, who holds office two years, and a council. The electric-light plant and the waterworks are owned and

operated by the city. The majority of the inhabitants are German or of German descent. Pop. (1920) 6,745.

NEW WAY TO PAY OLD DEBTS, A.

— Though he wrote one play that has lasted to succeeding times, Massinger was not a dramatist of first rank. Coming to London 20 years after Shakespeare, he fell into the confusion of influences of the most tangled period of English theatrical history. Of these the chief was always that of Shakespeare. But this was subjected to the heavy pressure of Ben Jonson, a dramatist who had better repute for some years after Shakespeare's death than Shakespeare himself. 'A New Way to Pay Old Debts' is the best regarded of Massinger's plays. The theme of the knave outwitted is one which Jonson might have used himself; it has indeed some points of similarity to Middleton's 'A Trick to Catch an Old One.' The characters are the well-known Platine types, snobs, sycophants, cheaters, usurers and gluttons. Instead of incorporating this as would Jonson in a form of railing and ridicule, Massinger adapts himself to the school of Shakespeare as modified by Fletcher. Judged by itself, the style is excellent. It is lucid, flowing, eloquent. The construction is simple and well-fashioned. This does not disguise the fact that the method does not fit the theme. Of psychology there is none. The characters are symbols of mental traits handled to an arbitrary moral conclusion.

The play lives in memory for one of the chief acting characters of the old drama, the figure of the usurer, Sir Giles Overreach. Like Barabas in 'The Jew of Malta,' Sir Giles is a double-dyed villain, who sets no limits to his avarice, treachery and blood-lust. The author permits him to escape due retribution, if such were possible, by going mad after a fashion dear to the hearts of play-goers of the day. This part is said to have been modeled upon life. All the other characters are profiles only.

'A New Way' was produced about 1625; it was published seven years later. Garrick revived the play in 1748, though he did not play Sir Giles. The rôle was played by Edmund Kean in 1827. The play has been at least twice translated into German.

THOMAS H. DICKINSON.

NEW WESTMINSTER, Canada, city in the province of British Columbia, situated on the north bank of the Fraser River about 16 miles from its mouth in the Gulf of Georgia, on the line of the Canadian Pacific Railway, Canadian Northern and the Great Northern Railway, of which it is the northern terminus, 12 miles from Vancouver and 75 miles from Victoria on the island of Vancouver. It is connected with Vancouver and surrounding district by an electric railway. The climate is mild and pleasant. The Fraser River Bridge connects the city with United States lines by way of the Great Northern Railway and with the south bank of the Fraser and its farming, poultry-raising, fruit and vegetable interests. The chief industries are lumbering, the salmon fisheries and their 40 canneries up the Fraser, oatmeal and woolen mills, machinery and boiler shops, foundry, furniture factory, fruit canning factory, cold storage works, carriage works, creameries, shingle mills and car shops. The steamers ply up and down the river. There is deep

water (30 to 40 feet) all the way and large ships are loaded at the mills with lumber for all parts of the world. There is an Anglican and a Roman Catholic cathedral, and the educational facilities include Columbia College. There is a free library. The electric-light, water and street railway systems are municipally owned. The city was founded in 1859 by Colonel Moody, and was the first capital of the colony of British Columbia, with the early designation of Queenborough. In 1860 municipal government was established. In 1873 New Westminster was incorporated as a city. There was a widely destructive fire in September 1898. Pop. about 20,000.

NEW YEAR'S DAY. The observance of the first day of the year is of very ancient origin. The Romans on this day were accustomed to exchange greetings and make presents. New Year's under the Cæsars was a great source of profit to the emperor and quite burdensome to his subjects. The Church at first prohibited Christians from having anything to do with it, but at last made the day a Christian festival, the Feast of the Circumcision. The Julian or Old Style Calendar was abandoned in favor of the Gregorian or New Style Calendar in 1582 in Catholic countries; but it was not until 1752 that the change was made in Great Britain. In Persia the year is supposed to begin on 21 March, and the day is one of universal rejoicing. In Japan the new year is a season of much festivity and innocent mirth. Every portal is decorated, and each object of which the decoration is composed has a symbolic meaning. The usual form of the decoration is a green arch. Among the Chinese the day is the greatest festival of the year, and in France, French Canada and Scotland it is observed more than Christmas. The custom of bringing in the New Year is the occasion of much festivity in Germany and Scotland. A custom similar to that of making New Year's calls is the sending of cards to one's friends on the day. After the restoration of the Bourbons it became fashionable in Paris to send bonbons on New Year's day, and in 1822 a thousand tons of them were sold in the two days preceding the festival.

The day was more or less observed among the American Indian tribes. The Moqui celebration, called So-yal-u-na, is largely a presentation of a singular and elaborate mythic drama, divided into two parts, in which offerings are made to effigies of the great plume-headed serpent, the enemy of the sun, followed by a sun dance, in which the conflict between the sun and the inferior hostile gods is admirably portrayed by Moqui men personifying the various deities.

In the United States it has always been the custom of the Presidents to receive on New Year's day. In 1790, when New York was the seat of government, Washington held a reception between the hours of 12 and 3 and was visited by all the home and foreign dignitaries. He expressed the hope on that occasion that whatever change might take place in the manners and customs of the city, the observance of New Year's day might never be given up. In New York and other cities there are watch-night and services in many churches and receptions in many clubs and drawing-rooms. The

formal custom of receiving New Year's calls has nearly become obsolete in our larger cities, it having been superseded by the regular afternoon and informal evening receptions, to which gentlemen take more kindly than to the old-fashioned New Year's party. The good old Knickerbocker custom is still maintained by some families. Some give formal dinners, and in the country carriage loads not infrequently go round from house to house making merry calls, picking up additions to the party and finally ending with supper at some hospitable house and in an evening with games, refreshed by apples, roast chestnuts, plum cake and sweet cider. The day was not observed in Colonial times with the formality which has marked its observation in later years. After the colonies had adjusted business affairs to the new date, the first of January grew in importance and in course of time became a legal holiday. (See CALENDAR). Consult Chamber's 'Book of Days.'

NEW YORK (the "Empire State"), a State in the northeastern part of the United States, lying between lat. $40^{\circ} 30'$ and $45^{\circ} 1' N.$ and long. $71^{\circ} 50'$ and $79^{\circ} 46' W.$; bounded on the north by Lake Ontario, Saint Lawrence River and Canada; on the east by Vermont, Massachusetts and Connecticut; on the south by the Atlantic Ocean, New Jersey and Pennsylvania; on the west by Pennsylvania, Lake Erie and the Niagara River. Lake Ontario is west of the northern part of the State and New Jersey is west of the southern part of the State. Lake Champlain is on the boundary between New York and Vermont. The extreme length of the State from north to south is 312 miles; and from east to west 326 miles, or 412 miles including Long Island. The area is 49,170 square miles, of which 1,550 square miles are water surface. The State contains 30,476,800 acres of land, of which in 1910 22,030,367, a decrease from 1900, were in farms. It ranks in area the 26th among the States of the Union.

Topography.—About one-half the boundary of the State, exclusive of Long Island, is water. The chief inlet is New York Bay. Long Island, southeast of the mainland of the State is separated from New Jersey by Staten Island Sound; Staten Island, southwest of the mainland, is separated from New Jersey by Staten Island Sound, Arthur Kill and Newark Bay. Both these islands have inlets along the coast, some of which are good harbors. Along the shores of Lake Champlain and Lake Ontario there are a number of small inlets. In the Saint Lawrence River, where it leaves Lake Ontario, are numerous islands, many of them well wooded and beautiful. The group is called "The Thousand Islands." These islands are favorite summer resorts. Long Island on the south is a part of the coastal plain; the greater part low; the highest elevation is 382 feet. The eastern part of the State is mountainous, the ranges extending generally northeast and southwest. The central and western parts of the State are rolling or level land. The mountains belong to the Appalachian system. In the northeastern part of the State are the Adirondacks. Mount Marcy, the highest elevation in the State, 5,344 feet, is a peak of the Adirondacks. There are several peaks from 2,000 to 4,000 feet. These mountains

are covered with forests, largely pine. The Adirondacks extend along Lake Champlain south of the valley of the Mohawk and west nearly to Lake Ontario. They are noted summer and health resorts; more people visit the Adirondacks annually for health or pleasure than any other outing place in the country. These mountains toward the south become ranges of hills which slope to the Mohawk in the east and to the lake shore plain on the west. South of the Mohawk Valley the land again rises to what is known as Catskill Mountains. Some of the peaks amid the Catskills are fully 3,000 feet high. Slide Mountain, the highest peak, is 4,205 feet above the sea. The Shawangunk Mountains, more a plateau, are south of the Catskills. The highest part of the plateau is in the west back from the Hudson from 1,000 to 2,000 feet. On the southeast and north is a limestone escarpment, Helderberg Mountain, which in some places attains a height of several hundred feet. In the western part of the State and parallel with Lake Ontario are two well-defined terraces each about 200 feet in height. The Lower Terrace, called Lake Ridge, extends from the Genesee River to the Niagara, and is from three to eight miles distant from Lake Ontario. This Lake Ridge marked at one time the southern shore of Lake Ontario, when the outlet of the lake was by way of the Mohawk Valley. The Upper Terrace, called Mountain Ridge, is about 30 miles inland, and extends east and west almost parallel with Lake Ridge. The highest part of the plain or plateau portion of the State is in Otsego County, where it attains the altitude of 2,300 feet. "Rock City," Allegany County, upon a summit 1,400 feet above the surrounding valleys, consists of a tract of 40 acres covered with rocks broken into layers forming streets and alleys.

Hydrography.—The waters of all the rivers of the State finally enter the Atlantic Ocean. They reach the ocean by way of the Saint Lawrence, Hudson, Susquehanna, Delaware and Mississippi rivers. The great valleys of the State are the Hudson and Mohawk valleys, which divide the State into three sections, one east of the Hudson and south of Lake Champlain, one in the northern part of the State, almost surrounded by water; Lake Champlain and the Hudson on the east, the Mohawk and Oswego rivers on the south and southwest and Lake Ontario and the Saint Lawrence River on the west and north. The remaining section embraces the central and western parts of the State. The main stream lying wholly within the State is the Hudson River (q.v.), which with its tributaries, the largest being the Mohawk (q.v.), has been a great aid in the development of the commerce of the State. Through the Mohawk Valley the Erie Canal extends, and beyond to the Great Lakes, thus making a continuous waterway from the ocean north to the Mohawk and thence west across the State. The northern part of the State is drained by rivers which flow direct to the Saint Lawrence. The largest are the Black, Oswegatchie, Grasse, Racquette, Saint Regis and Salmon. The Saranac enters the Saint Lawrence through Lake Champlain, and the Genesee and Oswego through Lake Ontario. The Susquehanna has its head waters in Otsego County, and the source of the Delaware is southeast of Otsego Lake. The Allegheny River, in the

western part of the State, enters the Mississippi through the Ohio River. There are a number of falls and picturesque gorges in the Genesee River in the vicinity of the points where the stream breaks through the terraces. In the Adirondack region there are a number of beautiful lakes, the waters of which are remarkably clear. Lake George (q.v.), on the south slope of the mountains, is famous for its scenery and the points of historic interest surrounding it. Lake Champlain (q.v.), on the eastern boundary, together with Lake George, belong to the Saint Lawrence River Basin. In the central part of the State are a number of lakes, long and narrow, which are called the Finger Lakes. The largest are Cayuga and Seneca, about 40 miles long, and from two to four miles wide. Oneida (q.v.) Lake is nearly circular in form. Lake Chautauqua, in the western part of the State, 1,212 feet above sea-level, is the highest navigable body of water east of the Rocky Mountains. The waters of this lake enter the Mississippi although it is only nine miles from Lake Erie. The most noted water-falls and natural curiosities in the State are Niagara Falls, in Niagara River, 2,900 feet wide and 160 feet high; Portage Falls, in Genesee River, consisting of two falls, of 70 feet and 110 feet, and a series of rapids 150 feet; Genesee Falls, in Genesee River, at and below Rochester, consisting of three falls, of 96 feet, 25 feet and 84 feet, within a distance of two and a half miles; Trenton Falls, in West Canada Creek, Herkimer County, consisting of five cascades with a total fall of 200 feet in half a mile; Taughannock Falls, in Tompkins County, 230 feet; Chittenango Falls, in Chittenango Creek, Madison County, 136 feet; Lyon Falls, in Black River, Lewis County, flowing down an inclined plane 63 feet, at an angle of 60 degrees; Kaaterskill Falls, Greene County, consisting of two falls, 175 feet and 85 feet; Baker's Falls, Washington County, consisting of a succession of falls and rapids, having a total descent of 76 feet in 60 rods; Cohoes Falls, in the Mohawk, near its mouth, with a total fall including rapids, of 103 feet; Glens Falls, Warren County, 50 feet; High Falls, in the Hudson, Warren County, 60 feet; High Falls, Ulster County, 50 feet; the Ausable Falls, in Wilmington, Essex County, 100 feet; Enfield Falls, Tompkins County, consisting of a series of cascades with a total fall of 230 feet; Buttermilk Falls, Genesee County, 90 feet; and the falls in Fall Creek, Tompkins County, consisting of five falls with a total descent of over 500 feet in a mile. In East Canada Creek, about two and a half miles from its mouth, is a series of cascades and rapids having a total fall of 75 feet in 80 rods. Upon Stone Bridge Creek, Warren County, is a natural bridge 40 feet high, 80 rods broad and 247 feet long. Dover Stone Church, Dutchess County, is a ravine 25 feet wide at the bottom, one to three feet wide at the top, about 40 feet long and 40 to 50 feet high. Near Kyserike, Ulster County, is a cave which has been explored one and one-half miles from its entrance. On Black River, at Lyons Falls, are the "Pictured Rocks"; and in Onondaga County are the "Cratean Lakes" and "Green Lakes."

Geology.—Nearly all the geological formations are present in New York. The Archæan is represented in the Adirondacks and the High-

lands of the Hudson, by gneisses, granites, ancient crystalline and metamorphic rocks. Potsdam sandstone of a kind which denotes existence in the Cambrian Age is on the north-east and west of the Archæan area of the north. The lower Cambrian rock shows in a narrow strip extending south from the head of Lake Champlain and in the vicinity of Lake George. The palæozoic constitutes four-fifths of the State and is represented by schists, slates, metamorphosed rocks in the east and by massive and hard sandstones in the Catskills. The palæozoic is represented by the Cambrian, Silurian and Devonian periods. The Adirondacks, Highlands and lands west were above sea-level in the Silurian period, but the area of the State west of this uplift remained submerged into the Devonian period. The Triassic and Jurassic are represented by Newark sandstones and shales, in Rockland County; and the Pleistocene, by glacial drift, and lacustrine and estuarine clays cover a great part of the State. The Pleistocene ice-sheet covered the entire State and accounts for many of the peculiarities of the topography.

Mineralogy.—The chief minerals of New York State are salt, iron ore, sandstone, limestone, fire-clay, marble, granite, slate, gypsum, petroleum, talc, mortar colors, natural gas and cement. The salt output of Michigan exceeded that of New York until 1893, since which year New York has ranked first as a salt-producing State. Gold in small quantities has been found in the Adirondack region, and natural gas is found near Lake Erie. Coal does not seem to exist in the State, although found in large quantities not far south of the boundary. The Catskill and Potsdam sandstone, the Hudson River bluestone and most of the limestone are valuable for building stone. The greatest deposits of hematite and magnetite are found in the Adirondack region. Rock salt is found south of Lake Ontario in the vicinity of Warsaw. The mineral springs exceed in value any other State except Wisconsin. The principal mineral and medicinal springs are the salt springs of Onondaga County; Saratoga Springs; New Lebanon and Stockport, Columbia County; Massena, Saint Lawrence County; Richfield, Otsego County; Avon, Livingston County; Clifton, Ontario County; Sharon, Schoharie County; Chittenango, Madison County, and Alabama, Genesee County.

The latest available report gives as the principal mineral productions of a year: Salt, 1,455,014 short tons, valued at \$6,505,041; gypsum, 712,665 short tons, valued in crude and manufactured form at \$6,410,221; petroleum, 1,000,000 barrels, valued at \$3,200,000; talc, 41,937 short tons, valued at \$530,154; metallic paint, 4,925 short tons, valued at \$45,050; Portland cement, 4,993,341 barrels, valued at \$9,403,015; natural gas, valued at \$2,798,000; limestone, valued at \$4,597,942; building brick, tile, etc., \$8,813,000; pottery, \$4,726,000; other clay products \$2,234,804; building sand, \$1,185,812; other sand and gravel, \$1,065,133; iron ore, 191,195 long tons, valued at \$1,049,050; sand stone, \$301,315; mineral waters, \$736,173.

Climate.—The climate of the State, as a whole, is continental; but that of Manhattan Island, Long Island and Staten Island is modified by the ocean. The average maximum temperature for the State is 100° and the minimum

is a little below zero. The Adirondack region, north of the highest point, or on the northern slope, is the coldest, having the longest and most severe winters. The mean temperature for January is, in the Adirondacks, 15°; on the coast 30°; in the western part 26°. The mean temperature for July, in the Adirondacks, is 64°; on the coast 70°, and in the western part 72°. The rainfall is copious, averaging for the eastern part of the State about 50 inches and for the western part 40 inches. The State is remarkably free from malarial conditions. The Adirondack region is noted for its freedom from conditions inducing tuberculosis.

Flora.—New York State was a densely wooded region prior to and during the early Colonial Period. As shown under the industrial interests of Forestry (q.v.), all the varieties of trees are found common to the latitudes in which the territory lies. The Adirondack and Catskill mountains are still covered with spruce, white pine and hemlock, while maple, birch, beech, basswood, ash and elm are found in lesser quantities and larch and cedar in the lake and marshland of the regions. In the western part of the State the more common trees besides pine are the hardwoods—oak, chestnut, maple, beech and hickory,—while tulip, walnut, locust, sycamore, poplar and butternut are widely spread. In the hill and mountain regions, laurel, rhododendron and whortleberry are found in profusion and shrubs of the lower plains are sumac, elder, hazel and sassafras. The native fruit plants include the berries,—strawberry, blackberry, raspberry, cranberry and huckleberry,—grapes, black and red cherries, red and yellow plums. The medicinal plants comprise ginseng, snake-root, wormwood, horehound, blue flag, tansy, wintergreen, peony-pleurisy or epilepsy-root, burdock, plantain and sarsaparilla. Conspicuous spring flowers are violets, buttercups, cowslips and anemones; in summer white and yellow water lilies; and in autumn, golden rod and asters. Different species of ferns abound and over 1,500 varieties of flowering plants besides the more popular ones here mentioned.

Fauna.—In the Adirondacks are still to be found, although in diminished numbers, the indigenous animals of the wild pre-Colonial Period. The puma or panther alone has disappeared, and the lynx is seldom seen. The gray wolf and black bear occasionally appear. Deer abound in the Adirondack region and under government protection elk, moose and beaver have increased in numbers. Mink, otter, sable and red fox are trapped occasionally; porcupine, woodchucks, skunks, weasels and muskrats are common. Deer also in Long Island, raccoon, and in southern counties opossum are found, while squirrel and rabbits are prolific in all parts of the State. Nearly 400 species of fish are found in the fresh and salt waters of the State, which now are periodically replenished from the government fish stations and hatcheries. (See paragraph *Fisheries*). The popular song birds are the robin, chickadee, song-sparrow, warbler, thrushes, orioles, vireos, wrens, bluebird, catbird and phoebe; while occasionally the acclimated English meadow lark is heard singing above the plains of Long Island. Geese, ducks, plovers, part-ridge, snipe, loons, terns, rails, grebes, woodcock and ruffed grouse are among wild game

birds, while pheasants in some parts of the State and quail on Long Island are liberated at certain seasons for the purpose of sport. A State game bird farm exists since 1909 near Sherburne in Chenango County. Shrikes and hawks and occasional golden eagles and bald eagles are the distinctive birds of prey.

Fisheries.—The oyster fisheries are the most productive, representing over half the total value of the fishing industries of the State. Next in value are the bluefish, clams and menhaden. The most valuable fisheries are on the coast of Long Island; Suffolk County ranks first. The shad and alewives are found in the Hudson; trout in the Adirondack lakes. The number of persons engaged in the fisheries has diminished from 1904. The State conservation commissioner, who has charge of the fishing industry, is pursuing a scientific system, looking to the preservation of the fish of the State.

Agriculture and Stock-raising.—The soil of two-thirds of the State is suitable for agriculture, only the rocky mountain area and some sand-belts are considered so unproductive as not to be classed with agricultural lands. All the other conditions for productive farming exist in a favorable degree. Until 1890 New York State ranked first in the value of its agricultural products; in that year some of the Western States reached first place and the farm products of each of three of them were greater that year than those of New York. As the wheat and corn output of the West has increased, the farm products and farm improvements of New York State have decreased. The average of improved land has decreased since 1880, and the nature of the crops raised has varied. The Western wheat and corn in competition has caused the decrease of wheat and corn crops and an increase in the hay acreage. Corn for forage is increasing. The annual hay forage acreage is about half the total crop acreage of the State. The 14th census reported 193,195 farms in the State with an aggregate area of 20,632,803 acres, including 13,158,781 acres of improved land. The same year the total value of all farm property was \$1,908,483,201. Market gardening, fruit growing, sugar beet raising and tobacco are the principal crops. The chief crops, with their acreage, yield and value for the year 1922 were: Corn, 798,000 acres, 28,329,000 bushels, \$23,513,000; spring wheat, 21,000 acres, 336,000 bushels, \$396,000; winter wheat, 445,000 acres, 8,678,000 bushels, \$10,240,000; barley, 158,000 acres, 4,108,000 bushels, \$3,040,000; clover seed, 11,000 acres, 28,000 bushels, \$280,000; oats, 1,059,000 acres, 31,770,000 bushels, \$16,203,000; buckwheat, 208,000 acres, 4,368,000 bushels, \$4,368,000; rye, 55,000 acres, 880,000 bushels, \$854,000; tame hay, 4,870,000 acres, 6,818,000 tons, \$96,134,000; beans, 93,000 acres, 1,302,000 bushels, \$4,948,000; potatoes, 340,000 acres, 37,400,000 bushels, \$22,440,000; tobacco, 2,000 acres, 2,500,000 pounds, \$814,000; apples, 36,000,000 bushels; peaches, 3,400,000 bushels, and pears, 3,200,000 bushels. On 1 Jan. 1923 there were in the State 510,000 horses, valued at \$58,650,000; 7,000 mules, valued at \$931,000; 1,678,000 milch cows, valued at \$105,714,000; 410,000 other cattle, valued at \$10,045,000; 532,000 sheep, valued at \$4,522,000 and 546,000 swine, valued at \$8,463,000. The wool clip of 1922 was 2,882,000 pounds. The census in 1920 placed the value of all farm crops that

Lower Saranac Lake, Adirondack Mountains

Copyright by Detroit Photographic Co.

year at \$417,046,864. The State that year was second in the production of hay and grapes. It was also second in the quantity of buckwheat grown and was second in the value of dairy products which were valued at \$756,045,942. The State also led in the value of livestock products with \$225,465,739.

High in importance of farm products is potatoes. New York State occupies a very high rank in the acreage devoted to potatoes, but in value of the crop New York surpasses Minnesota, Wisconsin and Michigan which surpass it in acreage and production. Market gardening is of considerable importance. Nearly all the farm lands of Long Island and the counties near New York City, on both sides of the Hudson, are devoted to market gardening. In 1850 the average size of farms was 112.1 acres, and in 1920, 106.8 acres. Farms occupied by tenants are 19.2 per cent of the total number. The dairy products of the State are of great importance and great value. The State ranks first in the production of milk, and second in the production of cheese. The amount produced is sometimes greater in some of the other States, but the quality in New York is the best and always brings the highest prices. The soil, vegetable and climatic conditions and the introduction of scientific methods in dairy farming have greatly improved the quality of the dairy products. The milk sold yearly brings on an average about \$159,000,000; butter, \$10,000,000. The dairy products bring about 31 per cent of the total income from the farms. Along the Hudson, especially in Ulster County and in the Genesee Valley and west there are large fruit orchards, apples predominating. In the lake region in the central part of the State grapes flourish. In production of grapes New York is second to California. New York annually produces 152,482,000 pounds with a value of \$10,673,790. Hops and tobacco are cultivated in the central part, hops especially in Franklin County. Floriculture is increasing in counties near the city markets.

Stock holdings were as follows for the years given:

	1920	1910
Dairy cows.....	2,081,074	1,508,672
Other cattle.....	63,737	812,921
Horses.....	536,171	590,150
Mules and asses.....	7,534	4,335
Sheep.....	578,726	929,547
Swine.....	600,560	665,027

Forests and Lumbering.—The original forests of the Adirondack region were composed chiefly of white pine, hemlock and spruce; near the base of the northern slope of these mountains there were large forests of maple, birch, elm, white pine, basswood, hemlock and spruce. The hard and soft woods were also found in the southern and western parts of the State. At one time New York ranked first among the States in lumbering interests. The only forests still standing in which there is much lumbering are in the northern part of the State. Spruce and hemlock now form the principal output for lumber. The pulp wood mills and paper mills are now using large quantities of timber, mostly spruce. The State now owns 1,814,550 acres in the Adirondack and Catskill areas, known as the Forest Preserve. This is under the control of the Conservation Commission under whose jurisdiction deputies work for the

prevention of forest fires and maintain tree nurseries from which they sell seedling trees at cost to private owners. Much of the forest land is still in the hands of private individuals and is subject to exploitation. The State has appropriated large sums to acquire some of it. New York State produced in 1921, 283,863,000 feet of lumber. See FORESTRY.

Manufactures.—New York ranks first among the States in the value of manufactured products. The Erie Canal was a great aid in developing many of the manufacturing industries of the State. It gave an opportunity to bring the raw material at small cost to places where there was water power, and then, still at low cost, to send the finished products to the markets. The rivers with their extensive water power have continued to hold the large share of the manufacturing even during the period when steam was the main power in many places, and now the water power is of greater importance in the development of electrical power. The enormous power of Niagara Falls is causing a remarkable increase in the output of manufactories, especially the aluminum, carbondum and machinery made at the city of Niagara Falls. The great electrical plants of the State are increasing the manufacturing power; as at Schenectady, Mechanicville and other places on and near the Hudson River (q.v.); also at Massena (q.v.) near the Saint Lawrence River and in many other parts of the State. The agricultural and mining interests of New York State are large and important, but her great manufacturing products are not only immense in amount, but of a wide and varied diversity. According to the 1920 United States census New York has held the foremost rank in manufacturing for many years, though, since 1849, when the first authoritative census of manufactures was taken, the proportion which the State has contributed to the total value of manufactured products in the entire United States has decreased somewhat. This proportion was 23.3 per cent in 1849 and only 11 per cent in 1920.

In 1849 the total value of the manufactured products of New York, including those of the neighborhood and hand industries, amounted to \$237,597,249, while in 1920, exclusive of the value of the products of the neighborhood and hand industries, it reached a total of \$8,867,005,000, or more than 40 times that in 1849. During the same period the population of the State increased nearly 200 per cent. In 1849 an average of 199,349 wage-earners, representing 6.4 per cent of the total population, were employed in manufactures, while in 1920, an average of 1,228,130 wage-earners, or over 10 per cent of the total population, were so engaged. During this period the gross value of products per capita of the total population of the State increased from \$77 to over \$800.

In 1920 the State of New York had 49,330 manufacturing establishments, which gave employment to an average of 1,524,761 persons during the year and paid out \$1,971,754,707 in salaries and wages. Of the persons employed, 1,228,130 were wage-earners. These establishments turned out products to the value of \$8,867,004,906, to produce which materials costing \$4,943,213,919 were utilized. The value added by manufacture was thus \$3,923,790,987,

which figure best represents the net wealth created by manufacturing that year.

The latest available statistics of leading manufacturing industries (census of 1920) will prove of interest. Clothing (men and women's)—Value of output for 1919, \$1,431,038,000; average number of wage-earners, 164,660. The increase in the value of clothing manufactured in New York from 1909 to 1919 was \$892,445,000. Textiles—Value of output, \$536,478,330; average number of wage-earners, 121,860. New York is the fourth State in the Union in the production of all textiles combined, third in silk and silk goods, fourth in fur-felt hats, first in the manufacture of hosiery and knit goods and of carpets and rugs, other than rag, and second in that of cordage and twine and jute and linen goods. It ranks fifth in the production of woolen, worsted and felt goods and wool hats, and 12th in that of cotton goods, including cotton small wares. Millinery and lace goods—Value of products, \$165,718,000. New York leads all other States in the Union in this industry. Fur goods—Value of products, \$134,219,000, constituting about 75 per cent of the total of the United States. Printing and publishing—Value of products, \$478,898,000. New York leads all the States in this industry as a whole and in each of its branches. Foundry and machine-shop products—Value of products, \$251,688,000, being the second State in the Union in this industry. Lumber and timber products (including logging operations, saw mills, planing mills and establishments manufacturing wooden boxes)—Value of products, \$82,508,000, giving New York ninth rank among the States in the lumber industry. Iron and steel works, rolling mills and blast furnaces—Value of products, \$100,593,000; average number of wage-earners employed, 17,901. The State ranks fifth in this industry. Paper and wood pulp—Value of products, \$129,381,000. New York leads all other States in this industry. Boots and shoes—Value of products, \$190,476,000, giving the State second place among the States. Electrical machinery, etc.—Value of products, \$179,973,000. Tobacco manufactures—Value of products, \$163,105,000, leading all States. Slaughtering and meat packing—Value of products, \$256,038,000, ranking third in this industry. Butter, cheese and condensed milk—Value of products, \$129,008,000. New York is second in this industry, Wisconsin being first. Gas (illuminating and heating)—Value, \$69,339,000, the State holding first rank. Furnishing goods (men's)—Value of products, \$53,261,000. Patent medicines and compounds—New York leads all other States with a total output valued at \$57,958,000. Chemicals—Total value, \$88,102,000. Automobiles—Total value of products, \$140,722,000, more than four times the amount reported for 1910. Sugar refining, cane—Value of products, \$268,318,000. Paint and varnish—Value of products, \$66,244,000 the largest of any of the States. Leather—New York occupies second place in this industry with products valued at \$98,095,000. Musical instruments—Total value of products, \$52,231,000, giving the State first place in this industry.

Industrial Importance of Cities.—The following table (United States census 1920) shows the average number of wage-earners and the value of products in many cities and towns of the State:

CITY OR VILLAGE	Average number of wage earners. 1919	Value of products. 1919

Transportation and Commerce.—The principal railroad systems crossing the State are the New York Central and subsidiaries, the West Shore (New York, Chicago and Saint Louis), the Erie, the Lehigh Valley, the New York, Ontario and Western, the Delaware Lackawanna and Western, the Pennsylvania and Delaware and Hudson. The great trunk lines of the country make connections with all these roads. In 1923 there were 8,390 miles of railroad in the State. The Mohawk and Hudson was the first railroad in the State; it was completed and ready for operation in 1831, extended from Albany to Schenectady and was 17 miles long. About 11 years afterward there was a railroad completed from Albany to Buffalo; next came the Erie, and then the road from New York City to Albany. In 1825 the Erie Canal (q.v.) was opened, and it has been in use in the carrying trade since that time. Other canals of the State are the Oswego, the Champlain and several branches. At the general election, in November 1903, the people voted an appropriation of \$101,000,000 to enlarge the Erie Canal and this has been added to from time to time until the total is approach-

ing \$200,000,000. The enlarged waterways system of central New York is now known as the New York State Barge Canal. (See **BARGE CANAL**). The State public service commission has general supervision of railroads, especially with reference to public safety and convenience and to any violations of the law governing the railroads of New York. New York ranks first in the Union in foreign commerce. Its exports and imports include every variety of raw or manufactured material that enters the United States. New York City ranks as the first shipping port of the world, coming ahead of London and Liverpool. The imports for the fiscal year ending 1921 amounted to the value of \$1,332,265,342 and the exports to the value of \$1,730,255,845. The exports consist largely of grain, flour, cotton, tobacco, apples and other fruits, preserved provisions, cattle and frozen meat. Most of the great railroad lines which bring merchandise from the West have their terminals on the New Jersey side of the harbor, but there are ample facilities for the transfer of goods to the docks on the eastern side by means of lighters and of barges which carry the loaded cars across. In New York State in 1923 there were 8,390 miles of railroad and 5,772 miles of electric railroad track. The canals of the State, used for commercial purposes, have a length of 638 miles, of which the Erie Canal has 340.7 miles. The commerce between the places in New York State and other points in the Union is much greater than the foreign trade of the State. Roads (highways) built by the State or with State aid aggregated in January 1921, 8,357 miles. There were in addition 80,112 miles of rural roads in the State, 17,500 of which were surfaced. The first State-aid Law for roads was passed in 1898, and up to 1 Jan. 1923, over \$100,000,000 from State and other sources have been spent on roads. In 1922 there were 1,002,293 automobiles in the State. For the year 1921, \$28,775,806 of State funds were made available for roads. In addition, the towns and counties spend several millions of dollars annually for the maintenance and construction of highways.

Banks.—In 1782 the first bank in the State was incorporated as the Capital Bank of North America. The second bank was chartered in 1791 as the Bank of New York. The privilege to establish a bank or the granting of a bank charter became a political favor after 1804, when the law was passed making it necessary to have the sanction of the legislature to establish a bank or issue currency. In 1812 there were 20 banks in the State, and in 1829, 48 banks. The charters were for a specified term of years, and various means were resorted to to secure renewals. It was deemed necessary to change the laws for the establishment and government of banks, and in 1829–30 a change was effected. The "safety fund" method was established. A board of bank commissioners was created, examinations and annual reports were established. (See **BANKS**). The system of clearing houses, now deemed essential, began in New York City. In 1854, the first year of trial for the new system, the exchange amounted to \$5,500,000,000. The total exchanges in the year 1922 were \$213,326,386,000. The conditions which govern commerce and finance make the clearing house of New York, practically, the clearing house of the United States.

Including the national banks of this State, the combined resources of banking institutions under State or Federal supervision are over \$13,000,000,000, not considering at all the enormous resources of private banks and brokers not under supervision, especially those of international reputation.

The statistics shown in tables on following page give valuable information regarding the growth of the banking system of the State.

Finance.—The State income is derived mainly from a tax for general expenses and for schools, 29 per cent; corporation tax, 25.5 per cent; excise tax, 17.5, and inheritance tax, 14 per cent. The first arrangement made for an income for State expenditures was the formation of a productive fund from the sale of public land. For a time the income derived from this general fund was sufficient for the support for the State government and the schools. In 1814 it was found necessary to increase the revenue, and this was done by forming another productive fund for school purposes. Later a direct tax was levied, but in 1826 this was discontinued. A system of public improvements was instituted in 1817, and a public debt of \$7,000,000 was incurred. The Erie Canal and other public improvements increased the debt. An effort was made to meet the new obligations by a sinking fund and by canal tolls and other means. The plan of loaning State credit to private corporations, principally railroads, was begun in 1827. In 1842 the Erie Railroad failed with a large indebtedness to the State. Other smaller creditors failed also, and this new debt, together with that of the former, amounted to \$20,310,000. A tax was imposed sufficient to meet expenses, many public improvements were stopped and outside debts were funded. The constitution adopted in 1846 inserted clauses looking to a prevention of such conditions. No debt could be contracted except for war, and then popular sanction by a referendum was necessary. A general sinking fund and a canal sinking fund were created. The constitution now in force retains the provision relative to popular sanction by a referendum. In the year 1895 the State debt was \$53,000,000. Of this amount \$30,000,000 was war bounty debt. In five years the debt was reduced to \$32,400,000; another decade saw it only \$8,988,000; and the whole debt was canceled before 1900. In 1900 a new debt was created for improvement of the Erie Canal. For the fiscal year 1920, the bonded debt was \$236,744,660, divided as follows: Canal, \$148,000,000; highway, \$80,000,000; Palisades Park, \$5,000,000; Saratoga Reserve, \$619,000. The income at present is derived from taxes on assessable property, fees from foreign corporations, licenses, taxes on certain public franchises, trusts and banks. For the year 1922 the expenditures were \$172,943,706.21, and the revenues, \$153,242,723.91.

Insurance Statistics.—In the year 1916 there were in force life insurance policies in the State of New York to the number of 8,036,874, aggregating in amount \$3,757,103,221. Premiums amounting to \$134,321,244.60 were received and claims under policies amounting to \$52,203,964.75 were paid. Fire insurance to the amount of \$7,141,805,428, and marine and

inland insurance to the amount of \$5,226,335,741 were written. In fire premiums \$51,158,907.53 were received and fire losses amounting to \$22,988,434.87 were paid. Premiums paid for policies in casualty, credit, title and other companies amounted to \$42,350,393.78 and losses paid amounted to \$18,102,251.46. Assessment life and accident associations had certificates in force amounting to \$69,070,038, and fraternal orders had \$533,362,492. Co-operative fire associations had in force insurance amounting to \$152,243,485.

Government.—The government of the State is administered in accordance with the provisions of the State constitution. This constitution may be amended by a majority vote of the house in two consecutive legislatures and adopted by popular vote of the people. It may be revised by a constitutional convention and the popular vote of the people. The last revision of the State constitution was made in 1894, and went into effect 1 Jan. 1895. This constitution provides for amendments and revisions as stated, and that the question of a

NEW YORK

1

2

1 View looking eastward from the summit of Mount Marcy with Hay Stack Mountain in the immediate foreground. Marcy is the highest mountain in the State of New York. It was called by the Iroquois Tahawus, which meant the Cloud Splitter. Around it are massed on all sides the highest summits of the Adirondacks.

2 Remarkable panorama of the Mohawk valley showing the New York Central Railroad, the Barge Canal and the river. The Mohawk was the pathway of the pioneers for a century or more before the canal was built; then came the canal and finally the railroad, both in their day great arteries of transportation.

NEW YORK

1 State plantation near the Ray Brook Hospital on State land. The hospital buildings are to be seen in the distance. This in time will be as fine a forest as are the European forests

2 A garden tree garden at Salamanca, N. Y., containing about ten million seedling tree plants. This and several other New York gardens are considered as good as there are in this or any other country. The experimental stage has been passed

constitutional convention and of a revision of the constitution must be submitted to the general vote of the people every 20 years, or more frequently if so ordered by the legislature. It provides also for a State census every 10 years. All citizens in New York State can vote, unless debarred by crimes against the law or of unsound mind. To be a citizen of New York State a man must have been a citizen 90 days, one year a resident of the State, four months a resident of the county and 30 days a resident of the town or precinct. It is also required that voters to be entitled to vote must register, but registration for town and village elections cannot be made obligatory unless by express provision of law. In the cities the holding of party primaries are regulated by law; and the way in which votes shall be cast in all parts of the State is also regulated by law. The officers of the government are the executive, the members of the legislature, the judiciary and their subordinates.

Executive.—The governor of New York is elected biennially, by popular vote at a general election held throughout the State the first Tuesday after the first Monday in November. He appoints a superintendent of public works, a superintendent of banks, of insurance, of State prisons, a council of farms and markets, a State architect, conservation commissioner, commissioner of highways, health commissioner and an excise commissioner. He has a veto right which may be used to prevent appropriations or other legislative measures; but the legislature may overrule the veto of the governor by a two-thirds vote of the members of the senate and assembly. He may pardon or reprieve criminals, and he may commute a sentence. He has power to make appointments other than those mentioned subject to approval by the senate. The officials elected with the governor and for the same number of years are the lieutenant-governor, secretary of State, comptroller, treasurer, attorney-general and State engineer and surveyor. The most important State boards or commissions are for hospitals and charities, for industry, civil service, public service, prisons and tax equalization.

Legislature.—The legislature is composed of a senate of 51 members, who hold office two years; and an assembly of 150 members, who hold office one year. The State is divided into senatorial and assembly districts. The senatorial districts, being less in number, have each a much greater population than each of the assembly districts. The lieutenant-governor is president of the senate. The members of the assembly elect their own presiding officer, who is called the speaker. The populous counties are divided into two or more assembly districts. The members of the legislature receive a salary of \$1,500 and mileage for each session. The legislature holds its sessions in the State Capitol at Albany.

Judiciary.—The Court of Appeals is the highest court in the State. It consists of the chief justice and six associate justices, each chosen by a popular vote and for a term of 14 years. Additional associate justices may be designated by the governor from among the Supreme Court justices to help out with increased business. There are 107 judges belonging to the Supreme Court, each one of whom is chosen by popular vote for 14 years.

The State is divided into nine judicial districts. Other courts provided for by law are County Courts, City Courts, Surrogate's Courts, Justice's Courts.

Local Government.—The incorporation of villages, chartering cities and organization of counties is within the jurisdiction of the legislature. The legislature decides the limit of taxation and assessment for incorporated villages and cities and restricts their power of borrowing money. Any special legislation for a city or the cities of the State shall be submitted to the cities concerned for their approval or rejection; but the legislature may later overrule the veto of the city. Cities are divided, according to population, into three classes. The first class includes cities having a population of 175,000 or more; the second class includes cities having a population of over 50,000 and less than 175,000; the third class includes all other cities in the State.

Militia.—The National Guard, a portion of the State militia, is armed, equipped and ready for service at all times. It numbered 20,243 in 1923 (officers and enlisted men). The Naval Militia is also a part of the State Militia and it also is ready for service at any time. It numbered 2,057 officers and enlisted men. There are four brigades of the National Guard. The headquarters are in Albany.

Political Divisions.—The State is divided into 62 counties. The county officers are judge, surrogate, sheriff, clerk, treasurer, district attorney, superintendent of the poor, coroners, and in some counties auditor and register. Each county, except New York, is divided into towns. The officers of the town are supervisor, clerk, commissioner of highways, assessors, collector, constables. There are 59 cities (1910), the largest of which are: New York, pop. (1920), 5,620,048; Buffalo, 506,775; Rochester, 295,750; Syracuse, 171,717; Albany, 113,344; Troy, 72,013; Utica, 94,156; Schenectady, 88,723; Yonkers, 100,176. The government of the cities is vested in a mayor, board of aldermen and the subordinate officials. Some cities are governed under a special charter. The villages are usually smaller than the cities and the government is administered by a president and a board of village trustees. There are 43 congressional districts; the State sends 43 representatives to Congress. There are State parks and reservations in the Adirondack Mountains and Catskills and others at Niagara Falls, Saratoga Springs and elsewhere. There are eight State Reservations for Indians in various parts of the State.

Religion.—All Christian denominations and the Jews have churches and large congregations throughout the State. Among Christian churches the Roman Catholic predominates in number of communicants and church attendance in the large cities, and Protestants in the smaller cities and country places. The Protestant denominations, according to number of communicants and attendance, rank as follows: Methodists, Presbyterians, Baptists, Protestant Episcopalians, Lutherans and Congregationalists.

Education.—The system of education aims to furnish free schools for all the minors of the State, and in late years a system of education for adults has been organized and put into force with success. Education is compulsory

between the ages of 7 and 16 years. The annual report of the education department (1922) gives the following statistics: Attendance.—Common elementary schools, 1,744,758; special elementary schools, 1,100; common high schools, 230,165; special high schools, 5,816; academies, 54,318; normal schools, 8,121; teachers training classes and schools, 3,543; universities, colleges and professional schools, 67,196; private schools (estimated), 275,000; Indian schools, 758; evening schools, 211,006; evening vocational schools, and trade and vocational schools, 99,644; total, 2,634,229. The number of teachers employed in elementary schools was 55,825; the net value of property, \$600,000,000, and the total expenditures average \$150,000,000. The teachers in public schools are in receipt of an average annual salary of \$1,256, and the total number employed in all departments—elementary, high school and college—averages 71,000.

Training for teachers is given in the State normal and training schools, one State college for teachers and a large number of training classes located in different villages and cities, according to the needs of the sections asking for the establishment of such schools. The system of granting certificates or of licensing teachers is by uniform examinations. The examination division of the State education department makes out the questions, assigns the time (for State examinations, the place), examines all the papers of the candidates and decides who shall or shall not receive certificates. Many of the cities have special rules regarding other examinations, and also the establishment and maintenance of city training schools and classes. The local educational officer in a city and in some of the villages is the superintendent of schools. The country sections are divided into 10,319 school districts and these are grouped in 207 supervisory districts each under a district superintendent. The State education department awards annually on the basis of an examination 750 scholarships, which entitle the recipient to \$100 a year, for four years, to attend any college in the State.

Cornell University (q.v.) is the only institution of collegiate grade in the State which awards special State scholarships by examinations. Columbia University (q.v.), founded under the auspices of the Protestant Episcopal Church, is the oldest institution of the kind in the State. Other colleges and universities are New York University, New York City; College of the City of New York; Union College, Schenectady; Hamilton College, Clinton; Hobart College, Geneva; Colgate University, Hamilton; Saint Lawrence, Canton; Fordham, New York City; Saint Francis Xavier, Manhattan and De la Salle colleges, New York City; Vassar, Poughkeepsie; colleges and universities in Buffalo, Syracuse, Rochester and Elmira; Barnard is affiliated with Columbia. There are 15 theological seminaries, 9 medical schools, 5 schools of pharmacy, 4 dental schools, 9 law schools. The State requires a certain degree of education before beginning the study of a profession, in a State school, and an examination is given at the end of the course to determine fitness and ability for graduation. The New York State Library claims to be the first public library in the State; it was founded in 1700. See LIBRARIES; REGENTS.

Charitable Institutions.—The governor and the senate appoints a State board of charities and a State hospital commission. The duties of the board of charities are to exercise an advisory supervision over charitable institutions, State and local, and over private institutions to which public charges have been committed. The institutions thus supervised number over 500, and the number of inmates in these institutions is about 60,000. The office of fiscal supervisor of State charities was created by chapter 252, Laws of 1902. He is appointed by the governor subject to confirmation by the senate, and has the general supervision over the accounts and expenditures of the charitable and correctional institutions of the State, which include reformatories, industrial schools, institutions for the mentally defective, institutions for soldiers, for the blind, orphans, crippled, deformed and treatment of tuberculosis. State charity institution buildings are contracted for under the supervision or by the approval of the governor, president of the State board of charities and the State comptroller. Among the present State institutions are a house of refuge for women at Albion, a training school for girls at Hudson, reformatory for women at Bedford Hills, soldiers and sailors' home at Bath, Craig colony for epileptics at Sonyea, home for feeble-minded women at Newark, home for orphan Indian children at Iroquois, industrial school, Industry, home for feeble-minded children, Syracuse, home for soldiers' widows, female dependents, orphans and army nurses at Oxford, hospital for crippled and deformed children at West Haverstraw, school for the blind at Batavia, hospital for cases of incipient pulmonary diseases at Raybrook. There are schools for the deaf and dumb, and many private institutions which receive State aid, but are not wholly supported by the State. There are supported annually in county almshouses during a single year about 20,000 persons with a daily average of about 7,500. In city and town almshouses a daily average of about 8,500 are supported. During the same time about 390,000 receive temporary relief. The expenditures for all the institutions supervised by the board of charities for a single year are about \$23,500,000.

The hospital commission has supervision of the State insane hospitals. They are located at Binghamton, Brooklyn, Buffalo, Gowanda, Kings Park, Middletown, New York City, Ogdensburg, Poughkeepsie, Rochester, Utica, Willard. This commission also has control over the two hospitals for the criminal insane at Matteawan and Dannemora. There are about 37,000 patients in these institutions. There are also 20 private institutions authorized by the State board to receive insane patients. The private institutions, partially under State supervision, have about 1,000 inmates. The cost for maintenance and operation of the State insane asylums or hospitals is about \$7,000,000.

Penal Institutions.—The State prisons are located at Ossining (Sing Sing), Auburn, Clinton (Dannemora). The State reformatories are at Elmira and Napanoch; one for women is at Bedford. Houses of refuge for women are at Albion and Hudson. The State penitentiaries (county institutions for short term convicts) are in the counties of Albany, Erie, Monroe,

Onondaga and Westchester. New York has numerous institutions of its own. The counties which do not have penitentiaries arrange with the penitentiary of some other county for care and support of those sentenced to such a place of detention and punishment. The following statement shows the number of convicts in the several State prisons 30 June in each of the last six years:

PRISON	1912	1913	1914	1915	1916	1917
Auburn.....	1,436	1,445	1,416	1,546	1,472	1,244
Clinton.....	1,282	1,382	1,430	1,400	1,443	1,227
Great Meadow.....	507	612	598	916	989	682
Sing Sing.....	1,421	1,281	1,511	1,539	1,582	1,356

The following are the expenditures of the State prisons for the year ending 30 June 1917, for maintenance and ordinary repairs:

Auburn prison.....	\$332,874.58
Clinton prison.....	294,735.95
Great Meadow.....	207,629.03
Sing Sing.....	334,253.03

The abolition of the fee system in many of the counties, the more general application of the law of suspended sentence, the efforts to induce prisoners to reform, all have contributed to the decrease in the number of prison inmates. The system of instruction and training employed at Elmira is resulting in practical reforms. The parole law and the indeterminate sentence are being introduced into many other prisons. Capital punishment is still in force in the State; death by electricity, since 1880, has been substituted for hanging. Murder in the first degree is the only crime for which capital punishment is inflicted.

Population.—Since 1820 the State has held first rank in population. The State receives the majority of the emigrants of whom great numbers domicile. The number of foreign born, resident in the State in 1920, was 2,786,112, or more than double the number in any other State. The population born in the State but of foreign parents was 2,844,083. There were the same year 5,503 Indians, 5,793 Chinese and 198,483 negroes. The urban population has increased and the rural has decreased. In the decade from 1890 to 1900, the rate of increase in population for the State was 21.2 per cent; the rate for the same year for the whole United States was 20.7 per cent. From 1910 to 1920 the rate of increase was 14.0. Pop. (1800) 589,051; (1810) 959,049; (1820); 1,372,111; (1830) 1,918,608; (1840) 2,428,921; (1850) 3,097,394; (1860) 3,880,735; (1870) 4,382,759; (1880) 5,082,871; (1890) 5,997,853; (1900) 7,268,012; (1910) 9,113,614; (1920) 10,385,227.

History.—As the credit for the discovery of America belongs to one Italian, Christopher Columbus, the protégé of the far-seeing Queen Isabella of Spain, the credit for the discovery of New York is linked with the name of another Italian, Giovanni da Verrazano, the Florentine, in the service of Francis I of France. Verrazano's ship, *La Dauphine*, which left Dieppe with several others in the autumn of 1523, unquestionably sailed by Sandy Hook in the middle of April 1524; proceeded as far as Raritan Bay, when by stress of weather Verrazano was forced to return to the open sea and continue his journey to the eastward. While Spain's discovery of the continent antedated the French discovery of New York by 42 years, the

French navigators anticipated the Dutch on the same lines by 85 years. The English who were the last to arrive had no part in discovering any of the land which is now known as New York, although eventually they controlled the entire territory from Florida northward.

French enterprise early determined the importance commercially and politically of the New World, although handicapped by the fierce civil wars that raged from 1560 until the accession of Henry IV in 1594. The year made memorable by the Edict of Nantes, 1598, which secured freedom of worship for the Protestants, the Marquis de la Roche obtained a commission to conquer Canada. His expedition was a lamentable failure. Five years later De Monts, who had been commissioned governor of Acadia, brought a number of colonists to Port Royal, subsequently called Annapolis by the English, but after two years of hardships the settlement was abandoned, the pioneers returning to France. De Monts' commission, which had been revoked, was revived by a company of French merchants who entrusted their fortunes to Samuel de Champlain, a man who by education, ability and perseverance was thoroughly competent to execute the responsible trust committed to him. What William Penn was to the English court, that was Champlain to the French king, Henry of Navarre. He was a soldier and sailor of fortune; a sincere and devoted Christian. To him must be accorded the imperishable honor of being the first man who set his foot in New York, as he was the first to teach religion to the Iroquois. In 1608 he founded the city of Quebec. The 12 years' truce which acknowledged the sovereignty and independence of the Netherlands by Philip II after their long and sanguinary struggle for liberty marked the beginning of a historic era in the New World. On the evening of 29 July 1609, Champlain at the head of a band of Montagnais Indians encountered a war party of Iroquois on the west bank of Lake Champlain near Ticonderoga in Essex County. The next morning the unfortunate Iroquois were introduced violently to gunpowder and the white man's sway and the white man's way opened on the Western Hemisphere.

On 3 September following, Hendrik Hudson sailed into New York Bay on the 80-ton ship *Half Moon*, with a crew of 18 men, half English and half Dutch. Hudson's son accompanied him. Hudson was an Englishman who had twice essayed to reach far Cathay by the northwest passage. The Dutch East India Company, which was the pioneer company to take advantage of discoveries of new territory and whose powers were elastic for the colonization of new empires and the government thereof, persuaded Hudson by the offer of a seductive pecuniary inducement to lend his ability and fearlessness as an explorer to their enterprise. Accordingly on the fourth day of April 1609, he sailed from Amsterdam to seek for the third time the passage to India by the north. Again he was thwarted by gigantic icebergs and impassable seas of frozen ice which blocked his way. He changed his course to the westward, passed Greenland and Newfoundland, and sailed south until he descried the promontory of Cape Cod. He designated the region beyond it New

Netherlands and for a long time the Dutch considered Cape Cod as the northeast boundary line of their territorial possessions. Continuing on his way, Hudson made Chesapeake Bay, but from letters which he had received from John Smith he understood his countrymen were in possession by right of discovery. He put about and headed to the north. He discovered Delaware Bay and river which he christened the Dutch South River. He fixed the southern boundary of New Netherlands from that point. On the second of September the Highlands of Navesink appeared over the horizon to the north. For a week Hudson loitered in the vicinity of Staten Island, which he named—an object of curiosity to the Indians as his ship was of wonder to them. September twelfth Hudson sailed into the Upper Bay and de Groote River, which was called by the natives Shatemuc or Mohicanituck, subsequently the North River, in contradistinction to the South and the East, and eventually the Hudson River in honor of the distinguished explorer who discovered it. Hudson had explored the neighborhood from Sandy Hook to Amboy, indulged in amiable converse with the aborigines and proceeded on his course in search of the northwest passage to India by the way of the Hudson River. It was only after 11 days' sail when he reached the end of navigable waters that he was compelled reluctantly to abandon the undertaking. With a deep feeling of disappointment he turned the prow of the *Half Moon* to the southward. The reports of his success, however, were forwarded to Holland and stimulated further enterprises in the way of exploring and colonization while Hudson was detained at Dartmouth, England, whither he had put in, owing to the threatened mutiny of his crew.

The following year the fur merchants of Holland dispatched another vessel to the River of the Mountains, which for the time was called the Mauritius after Prince Maurice, the stadtholder. In 1611 Hendrik Christiaensen of Cleves sailed for the same destination and returned with two young Indians, the sons of a Manhattan chief. In 1612 three Amsterdam merchants, Hans Hongers, Paulus Pelgrom and Lambert Van Tweenhuysen, sent two ships, the *Fortune* and the *Tiger*, to open up trade along the Hudson River. The *Tiger* was accidentally burned at Manhattan Island and Adriaen Block, its commander, during the winter of 1613-14, built a new vessel, the *Onrest*, of 18 tons, the first to be constructed on Manhattan Island.

Two settlements had already been started in what is now the State of New York; one by Christiaensen on Castle or Patroon's Island, on the west bank of the Hudson, a mile or two south of the present Albany, called Fort Nassau; the second on Manhattan Island, covering the space midway between the Battery and Rector street on the west side of Broadway. Block in the meantime had sailed away to the eastward in the vessel he had built, discovered the island which bears his name, drew a map of all the region and in consequence secured from the States-General a charter for the "New Netherlands Company" under which he enjoyed the monopoly of trade in that region until 1621, when the charter expired. In the latter year the Dutch West India Company came into existence, with a charter granted by the States-

General of Holland. Two years later additions were made and an act of amplification given. Under this charter, which was to endure for 24 years, the company was permitted to trade with the West Indies, Africa and "other places"; all other inhabitants of the United Netherlands were prohibited from trafficking with those countries. It was permitted to appoint governors and other officers; to determine the forms of administering justice, to make treaties and enact laws. Their first packet, the *New Netherland*—under the superintendence of Cornelis Jacobsen May—which plied her ocean trade for 30 years, brought in May 1624 over 30 families, 18 of whom established a settlement at Fort Orange near Albany under Adriaen Joris. Two years later two ships loaded with emigrants, agricultural implements and domestic animals left Holland for Manhattan Island, where the company had decided to erect a larger colony and their headquarters for New Netherlands. With the later colonists came the director-general, Peter Minuit, who the following year, 1626, purchased the island of Manhattan, containing 22,000 acres, from the Indians for 60 guilders, or about \$24.

The colony "boomed" from the beginning and the stock of the West India Company sailed upward. Under "the Freedoms and Exemptions" Act, adopted in 1628, the company gave authority to every person who should send over a colony of 50 souls above the age of 15 years, the title of "patroon" and the privilege of selecting tracts of land, except on Manhattan Island, eight miles in length along the river and as far inland as he pleased. It was obligatory for the patroon to be a member of the company. He was looked upon as a feudal prince. His possessions were exempt from taxation for 10 years. The colonists were prohibited from manufacturing woolen, linen or cotton cloth. Under authority thus conferred Kiliaen Van Rensselaer of Amsterdam, a diamond and pearl polisher, obtained, through Sebastian Jansen Krol, who had come out with Jan Huyck two years before as "a consoler of the sick," a tract of land 20 miles in length, from Baeren Island to Smacks Island, and 24 miles on either side of the river "stretching two days' journey into the interior," constituting the greater part of the present counties of Albany, Rensselaer and Columbia. Michael Pauw purchased from the Indians Staten Island and the land upon which Jersey City and Bayonne are now built. With the development of the land and trade the inevitable occurred. The patroons practically became rivals of the West India Company in the fur trade. As the business of the latter diminished the wealth of the former expanded. Minuit, unable to readjust the differences, was recalled. For two years the office was vacant. It was then filled by Wouter Van Twiller, a name that has been rendered synonymous with farce, burlesque, contempt and arrogance. Van Twiller had married a niece of Van Rensselaer and was an administrator of fair parts. He began the construction of a new fort; he built the first church edifice; a bakery; a brewery; he substituted brick for frame houses and new windmills for old. But his plans failed to mature because of his peculiar disposition. Dominie Bogardus, who had accompanied him to this country in the same ship, stigmatized him as "a

child of the devil" and threatened to "shake" him "from the pulpit as would make him shudder." Van Twiller was removed under charges in 1637 and left office, as did many of his successors, with a fortune he had accumulated in service. His successor was William Kieft, a man of slender abilities and an embezzler, whose 10 years of service were conspicuous for strife — with the English and with the Indians. Like Van Twiller, Kieft was deficient in the art of conciliation. His position was too big for him to handle. He gives a discouraging report of the condition in which he found the colony; farms were barren of tenants and of cultivation or thrown into common; trading vessels in poor shape; houses out of repair; only one saw-mill out of three was in operation; the fort at New Amsterdam, for whose repair his predecessor had received 4,172 guilders, lay in a state of dilapidation and the magazine was scarcely discoverable.

The first English flag seen in the vicinity of New York floated from the vessel commanded by Capt. Samuel Argall, the roving buccaneer, who in 1612 had captured Pocahontas and held her as a hostage for the good behavior of her father. Argall had been dispatched in 1614 on an extraordinary expedition by Sir Thomas Dale, governor of Virginia, to dispossess the unfortunate French people who had settled at Acadia. On his return from this successful buccaneering expedition, Argall paid his respects to the Dutch. He proceeded up the Hudson River to Albany, forced a surrender in the name of the English king, and sailed away. New Amsterdam likewise submitted to Argall's demand, but as soon as his vessels disappeared through the Narrows, the Dutch flag replaced the English ensign as had been done at Albany. In 1633, Jacobus Eelkens, the Dutch commissary at Fort Orange, brazenly attempted to establish English trade on the Hudson, but the scheme was crushed at its inception. The New Englanders were not satisfied with their possessions but coveted the more prosperous settlements of the Dutch to the westward. In 1638 Kieft had issued a prohibition against the English trading at Fort Good Hope near the present Hartford, which had been built in 1623. Shortly afterward, owing to the insolence of the English, an order in council was issued, to strengthen the post, to maintain Dutch supremacy. We first hear of English settlers in New York in 1640 on Long Island. They had crossed the Sound from Connecticut. When the English audaciously confiscated land, near Fort Good Hope, which the Dutch had prepared for planting and brutally chastised farmers who tried to plant, Kieft threw a detachment across the Sound in retaliation and dispersed an English settlement at Oyster Bay.

But Kieft found more trouble on his hands. The Indians of New Jersey betrayed signs of restlessness toward the governor of New Netherlands; he was threatened by the Swedes at the south; he realized the unfriendliness with which the Cavaliers of Virginia, Maryland and Delaware regarded his colony; he could expect no favors from the Puritans on the east. At this crisis he unwisely provoked a quarrel with the Indians by demanding tribute in maize and fur on the ground that the Dutch had supported them in defense of their enemies. From the day

Champlain introduced gunpowder to the savages on Lake Champlain, the red man of the forest had sedulously and successfully cultivated its acquaintance. So that when Kieft imprudently attempted to suppress the sale of guns and their accessories to the Indians, turbulence broke loose along the New York frontier. For three years the bloody strife continued, during which the Dutch in New Amsterdam were driven for protection under the guns of the fort and were reduced to much distress by the aggressive operations of the Manhattans, from the north, the Long Island Indians from the east and Delawares from the south and west, Roger Williams brought about an interview between Kieft and the sachems, but the peace which followed was of brief duration, for hostilities were resumed more savagely than ever before the end of the year. The Indians were bent upon a war of extermination of the whites. They felt their power, the force of their numbers and were thirsting for revenge. "When you first came to our shores you were destitute of food" exclaimed a sachem before a treaty council. "We gave you our beans and our corn. We fed you with oysters and fish. And now for our recompense, you murder our people."

In 1643 "the first germ" of our Federal Constitution was planted by the formation of a league for self-government and common defense by the colonies of Massachusetts, Plymouth, New Haven and Connecticut. For the time it was a powerful organization. To it, Kieft appealed in vain for aid, to carry on his Indian war. The confederacy was organized as much to make aggressions upon the thrifty Dutch as for defense against the Indians. Matters were going badly for Kieft until he solicited the support of Capt. John Underhill, a valiant warrior, under whose skill and energy an able-bodied force was raised, which encountered and defeated the Indians in several pitched battles. Peace was eventually assured in 1645 through the intervention of the Iroquois. Kieft failed to profit by the lesson. The act that led to his recall was the most infamous in Dutch colonial annals. Without the slightest provocation, he crossed to the west bank of the Hudson, with the soldiers from the fort, a mob from the streets and privateersmen and sailors from the harbor. Under cover of darkness he fell upon a band of peaceable and unsuspecting Indians at Pavonia and massacred men, women and children indiscriminately. Kieft left for home with a fortune. The ship was wrecked off the coast of Wales and governor and fortune went down together.

We now come to the much misrepresented and misunderstood Petrus Stuyvesant who arrived at New Amsterdam 27 May 1647, two years after his appointment as director-general. Stuyvesant was the son of a Friesland clergyman, who had been educated to the army and navy as well, had lost a leg in the attack on the Portuguese island of Saint Martin and wore as a substitute a wooden one, that was girdled with silver bands. He was 45 years of age, overbearing in manner, autocratic in speech, prompt and decisive in action and a devout churchman. He conscientiously attempted to carry out the instructions that directed him to guard against aggressions on the colony's boundaries, to preserve peace with the Indians

and to stimulate the growth of villages by the colonists. He found the colony much out of repair and the colonists next to demoralized. The dominating spirit that pervaded the West India Company and all that were connected with it, to the colonists themselves, was personal gain. New Amsterdam and Fort Orange, or Auranian as it was sometimes called, were flooded with an aggregation of unscrupulous merchants and traders, who robbed the Indians on one side and their customers on the other. The example was established by succeeding directors-general and the plain people emulated that example. Stuyvesant inherited the turbulence and the dissatisfaction left by his predecessor and struggled with it courageously and with a hand so firm as to incite unpopularity among many of whose plans he thwarted. A year before his arrival, Kieft had served notice on New England that the English "without provocation" had invaded New Netherlands, usurped divers places, done injuries and not given satisfaction, and that unless reparation were given "such means as God affords" shall be employed "manfully to redress ourselves." Stuyvesant for five years diligently attempted to establish pacificatory measures with the most powerful rivals of the Dutch, the English, and finally in 1650 by repairing personally to Hartford secured a treaty that fixed Oyster Bay, on Long Island, the western boundary of the New Englanders and Greenwich on the mainland.

In the meantime internecine quarrels aroused all the choler and tyranny in his nature. Without funds, the internal improvements he had in contemplation could not be carried out. He had seen how Kieft had quarreled with his "Eight Men," and as a concession for his taxation scheme he ordered an election, allowing the settlers in Manhattan, Brooklyn which had been established in 1645, Amersfoort and Pavonia, to elect 18 individuals from whom the governor and his council should select nine, who were to confer with the director on all measures tending "to promote the welfare of the commonalty and the country." Between the director and "the Nine," dissensions arose over finances. The latter refused to provide money for the repair of the fort, claiming the company was responsible for that expense. They objected to Stuyvesant's management; complained of the heavy assessment levied upon trade, and when he peremptorily refused permission for the people to assemble, they made a house to house canvass. The director ordered delegates from the militia and "the Nine" ordered a journal to be kept by one of their number, Adriaen Van der Donck, and forwarded eventually to the home authorities. Stuyvesant blazing with wrath arrested the writer, threw him in prison on the charge of libeling the government and seized the papers. The controversy was carried with more or less acrimony on both sides to Holland; petitions were dispatched across the sea complaining of the unreasonable and arbitrary exercise of power by the director. Stuyvesant in the meantime played into the hands of his enemies by his reduction of the Swedish possessions in Delaware. As the dissatisfaction of the Dutch burghers against him expanded, sympathy for him on the part of English settlers increased. He had established a weekly market in New York; in 1652 the city was in-

corporated; a year later the palisades were constructed to the north of the present Wall street from the East to the North River; four years later citizenship was created and the city was surveyed, streets were regulated and named and several of them paved.

Under Stuyvesant's administration religion was encouraged and fostered. As early as 1626, Sebastian Jansen Krol and Jan Huyck who had originally sailed to the country as "consolers of the sick" are found, on the Sabbath reading texts out of the Scripture and the creeds to persons who would attend. Two years later, in 1628, Michaelius, a minister of the Reformed Church, organized the first Dutch church in the New Netherlands with 50 communicants. In 1633 arrived Everardus Bogardus who sailed to this country on the same vessel with one governor, Van Twiller, to return home on the same vessel with another, Kieft, only to meet his fate at sea. His quarrels with both have become historical. Along in 1640 Dominie Johannes Megapolensis preached in the church which Kieft had built within the fort, before proceeding to his charge at Fort Orange, the present Albany. The Rev. Johannes Backerus, formerly a clergyman at Curaçoa, in 1647, superseded Dominie Bogardus in the pastoral charge of the Dutch church. New York had not escaped the wave of religious intolerance that had rolled over Europe during the preceding half century. An ordinance was adopted by the Dutch in 1640 that prohibited the exercise of all other religions except the "Reformed as it is at present preached and practised by public Authority" in the United Netherlands. The following year, however, this bigoted mandate was temporarily revoked. Father Jogues, the first Catholic missionary to New Netherlands, found that the colony harbored Catholics, English Puritans, Quakers, Lutherans, Anabaptists termed "Ministes" (the Mennists or Mennonites) and Dutch Reformers. He reported an order was in force denying "public worship" to all but Calvinists. In 1654 the application of the Lutherans to erect a church in New Amsterdam was refused; "no doctrine shall be encouraged in the colony" but "the true reformed," ruled the director-general. The English settlements repudiated the teachings of Megapolensis who in 1649 had succeeded Backerus and who claimed the Classis of Amsterdam in Holland exercised spiritual jurisdiction over the colony. Quakers were arrested, beaten with ropes, were fined and imprisoned for their presumption in preaching their heresies.

The outbreak of war between Holland and England called in play all of Stuyvesant's great ability as an executive officer. The city was put in a state of defense. He had established the city of New Amsterdam and appointed the burgomasters, the schepens and fiscal. He now attempted to adjust affairs with New England but in vain. Indian outbreaks excited the colony for several years. An uprising near New Netherlands was followed by massacres at Pavonia, Hoboken and Staten Island. In three days 100 Dutch colonists were killed, 150 were taken prisoners and a financial loss of 200,000 guilders, \$80,000, was sustained. Devastations at Esopus and the destruction of Wiltwyck were not the least disturbing problems he encountered in dealing with the Indians.

In the meantime the villages of Jamaica and New Haerlem had been created; a municipal court was established at Esopus, known as Wiltwyck; Arendt van Curler, long loved and trusted by the Indians as "Corlaer," had purchased the great flats at Schenectady and the colony was spreading forth like a blossoming plant, north, west and southwest of Albany.

The aggressions of the "malignant English" had been a source of annoyance to the Dutch for years. Cromwell at one time threatened to seize New Netherlands. In 1657 the commissioners of the United New England Colonies conceded Oyster Bay and Huntington to the jurisdiction of New Haven and three years later Huntington and Seatauket. In 1662 Connecticut laid claim to Westchester in spite of provisional treaty. Charles II had granted to the younger Winthrop Massachusetts Bay, including Connecticut, and to his brother James, New Netherlands; the fact that a great part of this territory was not his to give, but belonged to the Dutch, was not included in the consideration in the least. About this time John Scott appeared on the scene. He produced orders for the stringent enforcement of the British navigation laws in the colonies, claimed that Long Island belonged to the Duke of York and proceeded to place the English Long Island towns under one organization, of which he was elected "president." When he attempted to seduce the Dutch towns he encountered the strong arm and the stubborn will of the director-general. The contest was acrimoniously conducted, was protracted and only ended by the appearance, 29 Aug. 1664, in the bay, of the English fleet under Col. Richard Nicolls, who had been ordered by his royal master, the Duke, to take possession of the Dutch province, to reduce the Dutch to entire obedience, "to put them out of capacity of doing such mischief" as they had perpetrated in other quarters. It was repugnant and mortifying to Stuyvesant's courage to surrender his charge without firing a shot and, like a soldier of high spirit, he prepared to make determined resistance, in spite of the appeals of the city authorities and the clergy. "I would much rather be carried out dead," he exclaimed. Stuyvesant appealed in vain for help and for several days cleverly delayed the inevitable. He only yielded when Nicolls entered the harbor with his ships and an overpowering force, and he regretfully signed the articles of capitulation that had been agreed to by the magistrates. On 3 September, New Amsterdam became New York in honor of the Duke, the name of the fort was changed to James, also in honor of the Duke, and three weeks later Fort Orange surrendered and was called Albany, in honor of the Duke. One of the inconsistencies conspicuous in the seizure of New Netherlands by the English is that at the time peace prevailed between England and Holland.

The province received the name of New York. Its population was estimated from 6,000 to 10,000 souls. Municipal officers continued in power, but no more elections of magistrates were to be held by the people. Stuyvesant had insisted upon the guaranty of property and civil rights and freedom of worship — the Church of England service to be held in the Dutch church at New York upon the termination of the service of the Reformed Church. Court proceedings were to follow English models. The

province felt the direful effects of the next 10 years of European wars. On 30 July 1673 with war under way between Holland on one side and France and England allied, a Dutch fleet under Cornelis Evertsen and Jacob Benckes suddenly appeared off Staten Island. Capt. John Manning, in the absence of Gov. Francis Lovelace, who had succeeded the Duke of York's personal representative, Colonel Nicolls, was not disposed to offer resistance, for his soldiers refused to fight and his own people spiked his guns. He surrendered, and the name of New York was temporarily changed, and that of the fort to "William Hendrick." Anthony Colve was proclaimed governor of the province. Under the treaty of 1674 New York was restored to the English. Sir Edmund Andros, an intelligent and wise officer, was appointed governor. In 1678 he describes the province as containing 24 towns or villages with 20 churches, specifies its products and exports as provisions, tar, furs and lumber, fixes the value of estates of £150,000, and the number of men capable of bearing arms at 2,000. Under his régime the Navigation Act was enforced; friendship with the Indians was cultivated to neutralize the influence of the French; a classis of the Reformed Church was established 1679 in New York to ordain ministers, and the governor endeavored to individualize New York as "the most English in sentiment of the American Colonies." Owing to disputes with New Jersey, complaints were filed against Andros with the home authorities. He was recalled, and exonerated; in 1688 he returned under a viceregal government to consolidate the Northern colonies. In the interim the office had been filled by Thomas Dongan, an Irish soldier, a Catholic and a discreet and conservative leader. He brought instructions to issue writs for an assembly; and the people now saw in reality the culmination of hopes began during Stuyvesant's time — the possibility of popular franchise. Accordingly 17 Oct. 1683 the representatives of the people of New York met for the first time in assembly in New York City. The sessions continued until 3 November. It was ordained that assemblies should convene triennially. In 1685 a charter was granted to New York and in 1686 to Albany. The hopes of the colonists for better things were dashed to the ground; the assembly promised by the Charter of Liberties and Privileges never convened, for in February 1685, Charles II died, his brother James the Duke ascended the throne and as James the King repudiated the acts of James the Duke; the charter was vetoed, and the assembly abolished. Dongan had fallen under the royal displeasure by his failure to push forward the doctrines of the Church of Rome and was recalled.

Governor Andros was in arrest at Boston when the news arrived that James had been dethroned and the lieutenant-governor, Francis Nicholson, lacked energy and decision for the crisis. People moreover distrusted him. Wild and exciting rumors were abroad in the land. Stories were circulated that the Catholics were to join hands with the French and overturn the existing order of things. Jacob Leisler was a prosperous merchant and captain of one of the train bands. He had been born at Frankfort and had seen service in the German army. The people turned to him. But the three councillors

remained loyal to Nicholson. Leisler and his friends, fearful of the intrigues of the Catholics, proclaimed William of Orange, king. Ten members of the assembly were appointed by Leisler as a committee of safety, and Leisler was declared by them to be governor. He carried his authority with a high hand. He usurped the functions of the lieutenant-governor and claimed the title; he opened letters addressed to Nicholson and arrested and imprisoned those who refused to obey him. When French invasion upon the destruction of Schenectady in 1689 was imminent, he displayed great energy, declared himself as the acting governor and forced recognition from Peter Schuyler, mayor of Albany, who had resisted the authority of Jacob Milborne, son-in-law of Leisler, whom he dispatched up the Hudson with an armed force to subdue the thriving city. On the strife between Leisler on the one side and Capt. Richard Ingoldesby and Col. Henry Sloughter, who had been appointed governor by William and Mary on the other; on Leisler's imprudent actions, it is not necessary to dwell. Eventually he was forced to submit. Pursued by vindictive enemies, he and Milborne died as martyrs. Sloughter, stupefied with rum, signed their death warrants and they were hanged near the site of the present *World* building in New York City 16 May 1691. Leisler was unquestionably a sincere but misguided man. Four years later Parliament reversed the attainder of Leisler and his associates. Lord Bellomont, afterward the enlightened governor of the province, declared that Leisler and his son-in-law were "not only murdered but barbarously murdered."

The history of the province for the following 84 years is conspicuous for brawls between the governor and the assembly; for efforts to disseminate the doctrines of the Episcopal Church and to weaken the influence of the French and of the Catholic Church; to develop the land and the fur trade; to increase the growth of the towns; to preserve peace with the Indians; to cultivate privateering, and to wink at piracy; to reconcile differences with neighboring colonies. Much depended upon the sincerity, honesty and integrity of the governors. In the whole line of administrators from Nicolls to Tryon, under English rule not more than three governors can be cited in whom those three traits can be found. The governor's power was absolute. He not only made the laws but interpreted and executed them and when necessary unmade them. He usurped the prerogatives of the assembly and of the courts; his council were mere automatons who danced when he pulled the string. No act of the assembly was placed on the statute book without his signature, and no decision of the court was valid until he, as chief justice, passed judgment; and in this respect he exercised powers denied to the king for his majesty, while permitted to sit on the king's bench, was prohibited from expressing judgment. Time and again the governor was threatened with removal; now and then charges were preferred against him and once the grand jury was urged to indict him for high treason. It is a sad commentary on the record, that every colonial governor who took office poor left office a wealthy man. There were three notable exceptions, the Irish earl, Lord Bellomont; Robert Hunter, the friend of Addison and Swift, and William

Burnet, son of the bishop of Salisbury. The province had already become the haven of the persecuted of foreign countries. Between the years 1678 and 1696 the population of New York City had nearly doubled—from 3,400 to 6,000; that of the province had increased to nearly 30,000. The infamous practice of transporting felons to America and the degrading slave trade produced the most pernicious effects upon the cause of labor, stamping it with the stigma of disgrace in the one instance and involving a contraction of wages in the other.

Under General Hunter was tried the experiment of colonizing the Palatines. The scheme originated with English politicians who saw in it a vast profit in developing the British commercial resources, at the same time menacing French supremacy by strengthening the frontiers. Settlements were established first at Livingston's Manor, and subsequently along the Mohawk and in the Schoharie region. The experiment involved a loss of £100,000 to its projectors.

In 1732 occurred the memorable struggle between Rip Van Dam, the senior councillor, and Governor Cosby. The original cause was puerile and insignificant, and involved only a few pounds, a fraction of the salary Van Dam claimed during the 13 months he acted as governor; it culminated in one of the most glorious episodes in history and established the principles for the freedom of the press in this country for all time; through the courage of John Peter Zenger, editor, and the brilliant scholarship of Andrew Hamilton, his advocate in the famous trial for libel. Nine years later, the province was thrown into paroxysms of alarm over the so-called "Negro Plot." Several mysterious fires occurred in New York about the same time and the impression got abroad that negroes had kindled them with the ultimate determination of burning down the town. The only basis for the suspicion was the unsupported testimony of an ignorant immigrant woman who was bound out to the keeper of a disreputable resort. Every negro became a suspect and large rewards were offered for the conviction of an incendiary. Before the frenzy ended, under the judgment of the court, 13 unfortunates were burned to death, 18 were hanged and 70 transported.

For years, more or less apprehension prevailed over French invasion. The French wielded greater influence over the Indians through religion and princely presents. Settlements had been established at Oswego and at Niagara, and the governors were periodically at their wits' ends to protect them. November 1745, instigated by the French, a band of redskins rushed upon Saratoga—after Fort Hoosick had surrendered—killed the brother of Peter Schuyler and a number of others, spread destruction over the surrounding country and carried off to Canada a number of captives. The assembly of New York then followed the example set by Massachusetts and offered a bounty for Indian scalps. England had been remiss to a degree in neglecting even ordinary protection for its settlers. The home ministry permitted France to fortify and hold Crown Point, in spite of the protests from the province, whence war parties darted on their incursions of devastation, desolation and death.

Governor Clinton who succeeded Clarke as

governor in 1743 was a sailor by profession and carried into the office all the old-time martinetism of the quarter deck. He attempted to overcome England's handicap with her redskin neighbors. In August and September 1746 he held a council at Albany with the Iroquois with the intention of establishing an alliance and to counteract the marplotting of the French and the Jesuits. To strengthen the bonds of friendship and as an effective object lesson, Sir William Johnson, the English Indian agent for New York, appeared in the full garb of a savage, paint and all, and walked as an Indian chief at the head of the Mohawks. Owing to the illness of Governor Clinton, Cadwallader Colden explained to them that the French had been defeated at Annapolis; and that troops from Massachusetts, Connecticut and New Hampshire had captured Louisbourg. He informed them that the English king had sent troops enough to take Canada from the French and urged them to join the English in the undertaking. Oration was thereupon delivered, belts exchanged and presents divided; the Indians gorged and guzzled, warbled and danced and agreed to join the English procession, and the northern part of the province was overrun with war parties who scalped and spattered blood, of male and female, young and old, the strong and the helpless, with unbridled ferocity. Governor Clinton accumulated a princely fortune during his 10 years' service as governor and could well afford to quarrel with his assembly, as several of his predecessors had done, over the permanent support bill. His successor, Sir Danvers Osborne, hanged himself with his handkerchief 21 Sept. 1753, five days after his arrival in New York.

James DeLancey, lieutenant-governor, one of the best equipped men in the province for the position, succeeded him. He had been born in Albany and was the first governor to the manner born. He presided over the congress at Albany in 1754 that contemplated union among the colonies, and opposed the plan. The Treaty of Aix-la-Chapelle was a dead letter so far as the colonies were concerned, for French aggressions were more exasperating than ever. With the outbreak of the French and Indian War, Sir William Johnson, who had married the sister of the Indian chief Joseph Brant, and who never had commanded a company of troops on the field, was placed at the head of a force of 3,400, who marched to the northward. At Lake George on 8 Sept. 1755, occurred the battle which brought a baronetcy and a fortune to Johnson, deprived the officers who really won the victory of credit, led to the death of the celebrated Mohawk, Hendrick, and put to rout the French forces under the accomplished French general, Dieskau.

The main incidents in the French and Indian war were the capture of Fort Oswego by the French general, Montcalm, 14 Aug. 1756; the surrender and massacre at Fort William Henry at Lake George on 9 Aug. 1757 where Montcalm with 8,000 French and 2,000 Indians overcame the garrison of Colonel Monroe of 3,000 men; the surrender of Fort Frontenac to Col. John Bradstreet, and the surrender of Fort Niagara to the English 20 July 1759.

The birth of liberty in the State of New York practically occurred in the colonial con-

vention to consider the Stamp Act, 7 Oct. 1765. With the accession of George III, 25 Oct. 1760, a new conflict broke out between the colonists and the authorities. All commissions expired with the sovereign. It was now contemplated to permit the judges to hold office only "during his Majesty's pleasure" instead of "during good behavior." Up to 31 March 1774, when the Boston Port Bill became a law, agitation throughout the provinces had become more and more pronounced and the people more and more unsettled. The battle of Golden Hill in New York City in 1770 had inflamed the public mind to the possibilities and their representatives of the Crown in their constant collisions with the Sons of Liberty over the destruction of their liberty pole contributed naught in diminishing the drift of popular sentiment. On 23 May 1774 New York published its declaration of rights at Fraunce's Tavern in New York City. Two months later delegates were chosen for the first Continental Congress which convened in Philadelphia 17 Sept. 1774. On 1 May 1775 the committee of 100 was appointed as the successor of the New York committee of correspondence and the committee of inspection, respectively. The constitutional government had gone out of existence. The sentiment of the English party in New York City was naturally in sympathy with England; the old Dutch settlers, with their bitter remembrances of the 100 years of English rule, were almost unanimously in favor of revolution, but when the second Continental Congress convened in Philadelphia 10 May 1775, and the country had tasted all the horrors of war, there were members, especially from New York, who were still hopeful that the manifold grievances might be redressed. Grave events were happening with great rapidity. Fort Ticonderoga had been surprised and captured by Ethan Allen and Benedict Arnold 10 May; two days later Crown Point surrendered; within a week Arnold had captured Saint Johns, Canada, and William Tryon the last English governor, who five years before had succeeded Lord Dunmore, sought refuge on the British gunboat *Asia* in the harbor of New York. Throughout the war New York was the real battle ground; topographically and strategically its position was recognized as of the utmost value to English and American as well. The English plan of campaign was based upon that of the French of 1689 and of Montcalm in 1757; namely, to break the back of the province by an invasion operating from the north and from the south along the valley of the Hudson. It was the objective that brought Burgoyne to America in the summer of 1777, when the American forces and American people were disheartened by successive defeats that included the battles of Long Island and the evacuation of New York City; the defeat at White Plains and surrender and massacre at Fort Mifflin. Three of the most important battles of the Revolution were fought on the soil of New York; that of Oriskany, 6 Aug. 1777, which practically shattered the right arm of Burgoyne, and that of Walloomsac, for many years mistakenly called Bennington, which shattered his left arm, both of which contributed immeasurably to the culminating defeat at Saratoga where the first British army in the history of England lay down its arms to an army composed of farmers.

Sir Henry Clinton had started from New York only too late to assist Burgoyne and had captured Forts Clinton and Montgomery in the Highlands of the Hudson 6 October, 11 days before the surrender. On 16 Oct. 1777, the British colonel, Vaughan, ascended the Hudson to Kingston, which was burned without the slightest provocation, leaving a stigma upon the British name for pure vandalism that has never been effaced.

With Burgoyne's surrender, New York State was relieved of large standing armies, but was called upon to encounter straggling foes that menaced the frontiers and exposed towns to the close of the war. During the campaign of 1776 the safety of the people was indubitably secured by the tireless energy and countless resources of General Schuyler, but with his retirement from the Continental army as commander of the Northern District, the frontiers were left to shift to a large extent for themselves, and the Indians under Brant with the Tories under the bloodthirsty Butler swept over them with torch and scalping-knife, meeting with feeble resistance until Congress and General Washington selected John Sullivan to destroy their crops and burn their villages from the Chemung to Niagara.

In October 1780 the Schoharie and Mohawk valleys were ravaged by a force of 800 Indians and Tories under Sir John Johnson. With the exception of the slight skirmish at Johnson Hall where Col. Marinus Willett put the enemy to rout, New York saw no more active fighting except sporadic brushes here and there between the militia and straggling bands of Indians.

The constitutional history of New York dates from the adoption of the Declaration of Independence. The Provincial Congress which had been elected in April met in the city of New York 14 May 1776. Before the convention adjourned the subject of independence was considered and it was resolved that it was the sense of the colony that the people desired to continue dependent upon Great Britain. As soon, however, as it was known that the Continental Congress recommended that each colony should establish its own form of government, a decided change of sentiment occurred in New York. When the newly-elected convention assembled at White Plains 9 July 1776, the old régime had ceased to exist and the New York Congress became "the convention of the representatives of the State of New York," the Declaration of Independence was speedily ratified and a committee was selected, of which John Jay was chairman, to draft a constitution for the State of New York. The enemy seriously interfered with the plans of the convention. New York had been abandoned. The British men of war patrolled the harbor within seven miles of the place where the constitution framers were at work. Courts of law had been abolished, but the convention ordered that all magistrates and civil officers who were affected toward independence should continue to exercise their duties and that processes hereafter must issue in the name of people of the State of New York.

The draft of the constitution was submitted 12 March 1777. It was adopted 20 April and an election was ordered to be held in June. The sentiment of the constitution was decidedly

English and its tone was aristocratic. It discredited the office of governor and it distrusted the people. Its abiding faith in the judiciary stands out in a strong light. It was liberal in its religious sentiments in that it permitted "the free exercise of religious profession and worship without discrimination or preference of all mankind." Slavery was still supported, although Gouverneur Morris and John Jay, who had been most instrumental in drafting the instrument, had attempted to move for its gradual obliteration. Its two weak features were the Council of Appointment, which was supposed to be a check upon the governor, and the Council of Revision, which was supposed to be a check upon the legislature. The Constitutional Convention of 1801 was called to determine the jurisdiction of the governor and the Council of Appointment in the matter of patronage. The decision of the convention divided the responsibility equally between the four senators who constituted the Council of Appointment and the governor. The two obnoxious councils, Revision and Appointment, were abolished by the constitution of 1821 which at the same time enlarged the area of the elective franchise by removing the property qualification. The weakness of the Articles of Confederation that had become apparent within a year of their adoption threatened to shipwreck the country unless a strong form of government was organized and substituted in its place. General Washington and Alexander Hamilton had been agitating the necessity for a more powerful and cohesive instrument. On 17 Feb. 1787, the assembly of New York adopted joint resolutions instructing the delegates of the State in Congress to move that a convention be held for the purpose of amending the Articles of Confederation so as "to render them adequate to the preservation and support of the Union."

Messrs. Robert Yates, John Lansing, Jr., and Alexander Hamilton were appointed delegates to the Federal Constitutional Convention which met in Philadelphia on the second Monday in May 1787, and which concluded its work 17 September. Messrs. Yates and Lansing withdrew and Hamilton was the only delegate from this State who signed the new constitution. The State convention to act upon the new constitution convened at Poughkeepsie 17 June, and adjourned 26 July. Ten of the 13 States had ratified the constitution—one more than the number necessary—with New York rebellious. George Clinton, governor of the State from 1777-95, appeared as the most resourceful opponent of the new constitution and led the anti-Federalist forces on the argument that New York was too powerful and wealthy to place herself on a par with States not her equal in income and resources. Alexander Hamilton and Robert R. Livingston were the strongest advocates of the new constitution. In July notification was officially made that Virginia and New Hampshire had approved the new constitution, and the Federalists thereupon offered a resolution "that the Constitution be ratified in full confidence that the amendments proposed by this convention will be adopted." The resolution was adopted 30 to 27, eight members, including Governor Clinton, declining to vote. From this time forth two parties existed in the State of New York, the strict and the loose constructionists. The State of New York, owing to the

failure of the legislature to agree in the choice of electors, lost its vote for President at the first election under the Federal Constitution.

The first political struggle in the State occurred in 1792 over the election for governor, when Governor Clinton by a fluke defeated John Jay. New York had experienced a number of disputes with her neighbors over boundary jurisdiction, especially with New Jersey, Vermont, New Hampshire and Massachusetts. New York was the first of the States to cede lands belonging to her to the United States for the encouragement and development of immigration. Within a space of seven years, 5,500,000 acres of land within the State had been thrown open to settlers, bringing to the State treasury \$1,030,433. Population fairly jumped and it was necessary to create a number of new counties north and west of Albany. Internal improvements, turnpikes and the development of waterways were constant subjects of discussion, and these subjects received an extraordinary stimulus in 1807 when Robert Fulton made the first trip with his steamboat on the Hudson River between New York and Albany. Three years later a commission was appointed to survey a route for a canal to Lake Erie. On 16 April 1816, commissioners of construction were appointed, and in 1817 commissioners of the canal fund were organized. As the construction of the canal proceeded a number of counties were opened to the right and left, and when the canal was completed in 1825, the population of the State had increased to 1,500,000.

Up to the outbreak of the second war with Great Britain, political struggles in New York were marked by fierce acrimony. Never was hostility more bitterly displayed and personal vituperation carried to greater excess. Hamilton had fallen in the duel with Burr, and from that hour dueling was banished as a social evil in the State of New York. The Clinton family, the venerable George, who had been a candidate for President against Madison, through the wire pulling of his brilliant nephew, DeWitt Clinton, had been elected Vice-President and opposed the Federal administration of President Madison, whose New York representative seems to have been Gov. Daniel D. Tompkins, an adroit politician and an able man.

At the opening of the Presidential campaign of 1812, DeWitt Clinton aspired, through his Republican affiliations, for the Presidential nomination and was nominated by a number of his friends in New York City; but on 18 May, President Madison was unanimously nominated. When Congress declared war in June, the President issued a patriotic proclamation which rallied to his support the entire Republican party and forced Clinton to abandon his own party and consort with Federalists.

During the second war, Governor Tompkins stands out as strong a character as George Clinton during the War of the Revolution, and like the first war governor of the State, he was selected, in honor of the distinguished services he had rendered to his party and the State, to serve as Vice-President of the United States with James Monroe from 1817 to 1825, during "the era of good feeling."

Judge Tompkins presided over the Constitutional Convention of 1821. With the adoption of this constitution, the Federalist party went

out of existence for all time in New York State, and the new conservative element under the leadership of Martin Van Buren and DeWitt Clinton took charge of the party machinery.

It was during the term of DeWitt Clinton as governor that the anti-Masonic craze swept the State and largely influenced national politics by the disappearance of William Morgan from Canada, 12 Sept. 1826. On 4 July 1827, by legislative enactment, slavery was abolished. Gov. DeWitt Clinton died suddenly at Albany on 11 Feb. 1828 and his successor, Martin Van Buren, resigned in order to become Secretary of State in the Cabinet of President Jackson.

Under the administration of Enos T. Throop, who acted as governor until the regular election in 1830 when he was chosen governor, the manufacture of brick by machinery was begun in New York; the *Albany Evening Journal* was started by Thurlow Weed; the first omnibus was built and used in New York City; the Albany and Schenectady Railway was opened; chloroform was first obtained at Sacket Harbor; the Whig party was formed; the first horse street railway in the world was opened on Fourth avenue, New York City; and the Anti-Slavery Society of New York was organized. William L. Marcy, who succeeded Mr. Throop, resigned his seat as United States senator upon his election as governor, was a rabid partisan and rigid economist and favored moderate protection to home industry. He advocated internal improvements and after his re-election in 1834 recommended enlargement of the Erie Canal and approved the construction of the Black River and Genesee Valley canals. The city of Albany now was recognized next to Washington as the political storm centre of the Union for her reputed "Albany Regency," which for years made and unmade candidates, controlled legislation and ruled the party and the State with arbitrary and at times high-handed methods. Mr. Van Buren was responsible for the breaking up of President Jackson's Cabinet by his open recognition of Peggy O'Neil; his rejection by the United States Senate as Minister to England by the casting vote of Vice-President Calhoun would have led to a general dissolution of the Democratic party had it not been for the resolute individuality of President Jackson.

New York suffered with the rest of the country by the panic of 1837, which originally can be traced to the removal of the deposits from the United States Bank in 1833, and by the deluge of "shinplasters," as a consequence of legislative prohibition of bank bills under the denomination of \$5. The election of President Van Buren was immediately followed by the financial disaster, a calamity which arrayed against the State and national administrations the entire banking and financial institutions of the entire country; that opened the way to the election of William H. Seward, the first Whig governor, in 1838, and two years later of William Henry Harrison on the "Tippecanoe and Tyler too" platform, the first Whig President of the United States. So demoralized were the finances that in 1841 the State was unable to borrow money to pay contractors upon the canals and in 1842 a law was passed suspending work and providing for the raising of money by taxation. The Erie Railway which secured a charter in 1832, which obtained from the legis-

lature in 1836 a loan of \$3,000,000 and which by 1840 was completed as far as Goshen, was abandoned, the company made an assignment and it was not until 1851 that the road was completed. Public works of all character were suspended and discouragement and depression were paramount.

During the next decade through the administrations of Governors Bouck, Silas Wright, Hamilton Fish and Washington Hunt, the anti-ent troubles were a very prominent disturbing factor in the State and the question of slavery throughout the country began to assume proportions that pointed inevitably to war. The Constitutional Convention of 1846 was held at the height of the demand of popular sentiment for the limitation of the power of the governor and of the legislature and for the extension of the elective franchise. The Convention abolished the Court of Chancery, limited the power of the legislature over the revenues, stripped the legislature of the power to appoint general administrative officers of the State, and substituted general laws for the organization of business corporations instead of special legislation. In consequence a great impetus was given to the organization of banking, telegraph, insurance and railway companies to conform with the prodigiously expanding institutions of the State.

The split in the Democratic party, owing to the slavery problem, and the rapid growth of the Free Soil movement in New York, decided the election of General Taylor for President in 1848 and the election of Hamilton Fish as governor. The Whig party in turn was torn by dissensions in 1850 when Washington Hunt was elected governor over Horatio Seymour, and two years later when Seymour carried the election, it was a natural consequence of the condemnation of the people for the Compromise measures in Congress. The Whig party ceased to exist as a factor after 1852. With the exception of the slight disturbances in the State over temperance legislation, national politics monopolized the attention of politicians until 1857. In the meantime the American party and the Republican party came into existence. The agitations in Kansas and Nebraska, with the reckless threats of the Southern leaders in Congress, opened the eyes of the most sagacious to the possibilities of war between the sections of the country. The panic of 1857 produced a temporary set-back to the rapidly growing prosperity of this State. When Edwin D. Morgan was elected governor in 1858, the most active parties were the Democrats, the Americans, the Abolitionists and the Republicans. Governor Morgan was re-elected in 1860 on the same ticket with Abraham Lincoln, who had defeated New York's favorite senator, William Henry Seward, for the nomination for President at the Chicago convention.

On 12 April 1861 Fort Sumter in Charleston Harbor was attacked. On the 15th President Lincoln issued a call for 75,000 volunteers to defend the life of the Union. The Union Defense Committee of New York was organized that evening. Within 10 days 7,334 men were on their way to Washington—the first regiment to respond to the call was the 7th New York, Colonel Leffert's. April 16th the legislature created a State board to enlist and equip 30,000 men. Eighty-two companies were accepted in one week. The first volunteer regi-

ment left the State 29 April and the last 12 July. Governor Morgan, who had been commissioned major-general, was placed in command of a separate military department of the United States constituting the State of New York. During the four years of war, New York furnished 448,850 men, or one-sixth of the total. This proportion holds good in the total losses and casualties. For organizing, uniforming, equipping, substituting and transporting troops, the State expended \$3,745,554.98; for bounties, \$50,657,406; for relief, \$500,773; or in aggregate, all-things considered in the way of official outlay on the authority of the State, \$57,569,082.56. The sentiment of New York State placed the responsibility for the war upon the Democratic party, although at the outbreak thousands upon thousands of Democrats who had stood shoulder to shoulder with the political fire-eaters of the South joined the Republican ranks, a very large proportion obtaining commissions as officers in the army of volunteers which had been hurriedly thrown together. The succession of Union disasters, however, and the declaration of the Emancipation Proclamation by President Lincoln had created a feeling of distrust, uncertainty and doubt, which led in 1862 to the overthrow of the Republican party and the election of Horatio Seymour as governor over Gen. James S. Wadsworth, an estimable gentleman and valiant soldier. The rebuke administered was not so much in the nature of a protest against the war as it was a protest against the conduct of the war. The success of the Democrats led to a marked decrease in the number of enlistments, which forced the national government to resort to the expedient of draft. The demagogical utterances of Governor Seymour had led the reckless and lawless throughout the State to believe his hostility to the conduct of the war included protection for them in the commitment of criminal acts. Unprotected by the transfer of its local militia to Pennsylvania after the battle of Gettysburg, New York City was now exposed for several days to mob law in the enforcement of the drafting, unequaled in the history of the country. Governor Seymour directly repaired to the metropolis, began a conciliatory speech by addressing the mob as "my friends," but eventually warned them by proclamation. The insurrection was only subdued by the return of the local military organizations.

Governor Reuben E. Fenton succeeded Governor Seymour in 1864, having been elected on the same ticket which returned Abraham Lincoln to the White House for his second term as President of the Nation. With the return of peace the country was confronted with the difficult problem of assimilating the hundreds of thousands of soldiers who were now seeking employment in civil life and ordinary avocations. One of the first propositions considered by the people during the second term of Governor Fenton was the agitation for the convention to revise the constitution, which culminated in the Constitutional Convention of 1867 that assembled at Albany on 4 June. The Hon. William A. Wheeler of Malone, afterward Vice-President of the United States, was president of the convention which ended its labors on 28 Feb. 1868. The new constitution was adopted in the convention by a strict party vote. It introduced several original propositions. The

legislature was reorganized, restrictions were imposed upon the exercise of legislative powers; the veto power of the governor was strengthened; a court of claims was created and the judiciary system was modified. The legislature of 1868 failed to pass an act to submit the proposed constitution to the people; as a result of the general election held in that year the power of the State was transferred from Republican to Democratic hands. John T. Hoffman of New York was elected governor, largely due, it was claimed at the time, by flagitious debauchery of the ballot boxes in New York City by the Tweed ring which succeeded in carrying the State for the Democratic candidate for President, Horatio Seymour, by 10,000. From this year the vote of the city of New York in State politics was recognized as a powerful factor. Governor Hoffman was called "the veto governor" because of the unprecedented exercise of the veto power. During his four years in office he vetoed 495 bills, only two of which subsequently became laws. He established the precedent of filing his reason in writing with bills he declined to sign at the end of the legislative session. The Tweed ring during his reign attained the height of its power. For audacity and rapacity the methods of the Tweed ring were unequalled, but it was soon brought to grief through the disclosures of the *New York Times*. In the meantime it had succeeded in re-electing its favorite candidate, John T. Hoffman, who at the close of his office retired to private life. As a consequence of the operations of this ring, two Supreme Court judges, George G. Barnard and Albert Cardozo, and one Superior Court judge, John H. McCunn, were ordered to be impeached. Barnard was convicted and removed from office; Cardozo resigned and dodged his trial; McCunn was removed and shortly after died of a broken heart. While the exposé of the Tweed ring demoralized the Democrats, the Republicans were more or less torn by the dissensions in their own ranks on national affairs. An agitation for the revision of the Constitution had been general throughout the State for several years, had been advocated by Governor Hoffman and was now recommended by Governor Dix, who in his message called attention to the misuse of sinking funds and to the abuse of the appropriations by the legislature for private charities. The State was suffering from the oppressive financial weights that had been imposed by the War of the Rebellion from the reckless extravagance that had become a part of the body politic. A constitutional commission undertook to curb the expenditures and the squandering of public moneys. Samuel J. Tilden, who defeated Gen. John A. Dix for governor in 1874, and who had been actively instrumental in prosecuting the Tweed ring, carefully scrutinized the heavy expenditures that had been made on the canals, and advocated rigid retrenchment. The effect of the financial disasters of 1873 had fallen heavily upon the people of the State. In the winter of 1875 canal boatmen, owners and forwarders petitioned the governor for relief, urging a further reduction of tolls. On 18 March 1875, the governor sent a special message to the legislature arraigning the management of the canals. A commission was appointed to investigate the system. Twelve special reports were made to the governor, dis-

closing a long line of abuses and calling for the prosecution and punishment of recreant public officers.

Lucius Robinson was elected governor in 1876. He followed the efforts of his predecessor to curb extravagant outlays upon charitable institutions, urged economy in all public expenditures and used the veto power fearlessly. Governor Robinson was defeated in 1879. Alonzo B. Cornell, Republican, was the successful candidate. But for several years the Republican party, although successful in the Presidential election in 1880, was demoralized by the fierce struggle between the Stalwarts and Half-breeds, consequent upon President Garfield's repudiation of Senators Conkling and Platt in the matter of making Federal appointments in the city and State of New York. The assassination of President Garfield, the accession of Vice-President Arthur, the defeat for governor in 1882 of Charles J. Folger, the defeat for nomination to the Presidency of General Arthur and the election of Grover Cleveland for governor in 1882 and as President in 1884, all resulted from this bitter and unrelenting partisan warfare.

David B. Hill succeeded, as governor, Grover Cleveland, elected President, and held office from January 1885 to January 1892. During these years the first practical step for the creation of an Adirondack State Preserve was taken; the Niagara Falls Reservation was created; use of electricity in death sentences established; and State board of arbitration created.

Governor Hill was succeeded by another Democratic governor, Roswell P. Flower. The elections of members of the legislature were closely contested. Governor Flower urged the passage of laws for an enumeration of the population and the establishment of a forest preserve. A law was passed calling for the meeting of a constitutional convention in 1894. When this met it was under the control of the Republicans and many changes were made, the most important being that which set the governor's term at two years and another which was aimed to prevent the legislature from passing laws affecting individual cities. The constitution was accepted by the people at the election in November 1894 and is that under which the State is now operating.

Factional fights among the Democrats in the State and other issues enabled the Republicans to get control in the elections of 1894 and to retain it until 1911, electing as governors Levi P. Morton, Frank S. Black, Theodore Roosevelt, Benjamin B. Odell, Frank W. Higgins and Charles E. Hughes in the order named.

In the year 1898 the Spanish-American War broke out and gave New York and its citizens an opportunity to distinguish themselves in their service to their country. In this no one was more prominent than Theodore Roosevelt, who had now a reputation for tackling reforms in the civil service and in the management of the police in New York City. His popularity born of a dramatic career as colonel of the "Rough Riders" during the war carried him into the governor's chair. His measures for franchise taxation, civil service reform and other legislation met with considerable opposition from the older members of the Republican party, but were eventually put through.

In the last year of Governor Flower's administration, 1894, the Republicans had got control of the legislature and they began a series of investigations, particularly into matters affecting the control of New York City by the Democrats. The first, known as the Lexow committee of the senate, showed that the police of that city had been interfering in the elections, and the second, chosen in 1899, and known as the Mazet committee of the assembly, showed that Tammany candidates for judgeships were systematically levied upon for campaign contributions.

The Republicans themselves, however, were not able to keep free of accusations of wrongdoing. In 1895 a question of appropriating \$9,000,000 for Erie and other canal improvements was submitted to the people and passed, but in 1899 there was so much talk of corruptions in the canal expenditures that Governor Roosevelt appointed two Democratic lawyers to make an investigation. They made a report which showed that there had been frauds perpetrated, but carried out in such a way as to make prosecutions difficult.

A commission was appointed to make a survey of the whole canal system. This recommended widening and deepening the canals so that they would accommodate 1,000-ton barges. Though vigorously supported by Governor Roosevelt, the recommendations were not carried through the legislature. Governor Roosevelt also appointed a commission to revise the New York City charter, many of whose provisions had met with severe condemnation. Many changes were made and put through by the legislature under Roosevelt's successor, Benjamin B. Odell.

It was commonly stated that Governor Roosevelt because of his offense to old Republican leaders in his efforts to "clean up" bad conditions wherever found was nominated for Vice-President of the United States in the elections of 1900, with the idea that this office would put him in obscurity. He was elected and McKinley was chosen President. The assassination of the latter in 1901 elevated him to the Presidency.

Governor Odell was very active, proposing constructive legislation and in carrying it through. Under his successor, Frank Higgins, were begun the preliminary investigations into the political activities of the great life insurance companies, which really brought the next Republican to the chair of governor.

One of the ablest of the Republican governors in the matter of reforms was Charles E. Hughes. He came into prominence in 1905 as counsel for the Armstrong commission of the legislature, which was appointed to investigate the life insurance companies. The revelations of the use of the policyholders' money to influence legislation created so much indignation that Hughes became a popular candidate for governor and was chosen to the office in the elections of 1906. He determined to suppress gambling at race tracks and he carried his race-track bills through the legislature in spite of the bitterest kind of opposition.

He was equally determined to put through his direct primary law, which he felt would end the control of nominations for office by bosses in political conventions. He did not carry his measure and in 1910, during his last

year, he accepted an appointment as a justice in the United States Supreme Court.

The Republican party had been split by factions owing largely to the determined efforts of men like Roosevelt and Hughes to reform conditions, so that in the elections of 1910 John A. Dix, a Democrat, was elected governor. During his administration the people voted \$101,000,000 to enlarge the canals in order to make them navigable by 1,000-ton barges. Thus was begun the improvement which was to cost the State of New York nearly \$200,000,000 before it was finished.

A direct primary law to which the Democrats pledged themselves in the election campaign was also put through, but did not accomplish the purposes for which it was intended.

The Democrats did not retain their control of the State very long. In 1912 they elected William Sulzer. He began an advocacy of numerous reforms such as the child labor, minimum wage and other laws. He pushed vigorously for a perfected primary law. He soon came to serious disagreements with the party leaders and declared himself independent of them. They, through the members of the legislature, impeached him, not for anything which he had done while in office but because of his misapplication of campaign funds. On 18 Oct. 1913, he was dismissed from office and succeeded by Martin Glynn, who was the lieutenant-governor.

Under Glynn the legislature passed an improved direct primary law, abolishing State conventions. Upon his recommendation were also passed a short ballot law and a workmen's compensation law. A measure calling for the holding of a constitutional convention in 1915 was also passed and also another providing for putting into operation the amendment for the direct election of United States senators by the people instead of by the legislatures.

The dissensions in the Democratic party had so thoroughly split its forces that the Republican candidate for governor, Charles S. Whitman, was elected over Glynn in 1914 by a very large vote. The Progressive party, largely made up of Republicans, whose candidate was Frederick M. Davenport, did not draw off many votes from Whitman.

The people voted to sanction the proposed constitutional convention, and this was held in 1915. The majority of the members were Republicans and they chose as president of the convention Elihu Root. Other prominent members were Seth Low, Henry L. Stimson and George W. Wickersham. The convention proposed many changes, the most important being those which would give the governor greater power in the appointment of officials formerly elective. Many other changes met with bitter opposition from small groups all over the State. The result was that in the vote taken by the people in the November 1915 election, the proposed constitution was overwhelmingly defeated. The same fate happened to an amendment giving the suffrage to women, though the vote against it was smaller.

Governor Whitman, like his predecessor, Mr. Glynn, urged economy in expenditures, but there was nothing accomplished along such lines. A widowed mothers' pension bill was put through, but a measure to provide for State-

wide prohibition on referendum to the people was defeated by the legislature, even though it received the backing of the governor.

In 1916 Governor Whitman recommended the passage of financial measures increasing the power of the comptroller, and of other measures abolishing and reorganizing certain charitable institutions and prisons. He also recommended the establishment of a military training commission to co-operate with the board of regents in giving physical and military training to young men of high-school age.

The year 1917 was that in which the United States entered the great World War. Though almost everything was overshadowed by this event, Governor Whitman had recommended for legislative action the enactment of a township school law, by which many thousands of school districts were consolidated into less than a thousand. He favored and had put through a State constabulary bill, a military census bill, by which an enumeration of all persons under 45 years was taken, a food-control commission to keep prices under control, a food-supply commission to encourage food production and a State council of farms and markets. He also advocated, and the legislature passed, a compulsory military training bill for boys between 16 and 17 years of age.

In the November elections of 1917 the woman's suffrage amendment to the State constitution, which had been defeated by over 200,000 votes in 1915, was passed by about 90,000 majority.

In general the up-State districts were against it, and the largest vote for it was found in New York City, particularly in districts which had the reputation of being socialistic. The espousal of the cause of woman's suffrage by President Wilson and by Governor Whitman had some influence, but undoubtedly the factor most contributing to the result was the manner in which women's suffrage organizations had canvassed the State.

Governor Whitman determined to run for a third term and easily won the Republican nomination in the primaries over Merton Lewis. His Democratic opponent for the governorship was Alfred E. Smith who had had long legislative experience, was at the time president of the board of aldermen in New York City and had great personal popularity.

Many factors had combined to bring considerable opposition to Whitman's election. There was some feeling against his having a third term and many of those who had voted for Lewis in the Republican primaries turned their votes to Smith in the regular election. The farmers were said to have held up against him the increase of their taxes because of the township school bill, even though he had advocated its repeal and succeeded in having it repealed less than a year after its passage. The same people were also disaffected by the wavering policy in handling the foods and markets question. Still others were opposed to him because of his advocacy of prohibition and others because he did not go far enough in the same matter. Certain groups were hostile because of his strong advocacy of military training. All of these groups combined served to defeat him, even though the legislature chosen was Republican in both branches.

Governor Smith found himself at a disadvantage

because of this Republican majority against him. He advocated the creation of a reconstruction commission to handle problems created by the Great War, which had closed by an armistice in November 1918, bills providing for a referendum vote of the people on the prohibition amendment to the Federal Constitution, for the conservation of water power in the State, for the creation of a minimum wage commission, for maternity and compulsory health insurance, for the abolition of the State police, for the reorganization of the public service commissions and for the improvement of educational conditions by increasing the salaries of teachers. In 1920 the Republicans elected Nathan Miller governor in a close contest. In 1922 he was opposed by former Governor Smith. The latter was elected by the greatest plurality ever given any candidate for this office.

Leading Legislation.—1892-94. Roswell P. Flower, governor. Features of legislation were the establishment of the Adirondack Park; ordering a convention to amend and revise the constitution; the prohibition of pool-selling in poolrooms; the excise laws were finally codified, and the question of a Greater New York was ordered to be submitted to a public vote.

1895-96. Levi P. Morton, governor. The governor's term of office now becomes two years, instead of three. The two principal features of Governor Morton's administration were the enactment of the "Raines Law"—a high-license measure aimed at reducing the number of saloons and removing them from political influence; and the passage of the "Greater New York" bill, consolidating the local governments of the city and county of New York, the counties of Kings and Richmond and part of the county of Queens, giving the new metropolis an area of 359 square miles.

1897-98. Frank S. Black, governor. The charter of "Greater New York" received the signature of Governor Black and its provisions went into effect 1 Jan. 1898. Important canal legislation and the appointment of a commission to investigate the expenditure of canal funds were features of this administration.

1899-1900. Theodore Roosevelt, governor. Some insurance legislation is accomplished, especially as to the maintenance of a reserve fund; the "Mazet Inquiry" was held, regarding alleged levies for corrupting legislation; and a committee previously appointed to report on a more equitable distribution of taxation recommended important changes in the tax laws.

1901-04. Benjamin B. Odell, Jr., governor (two terms). "Palisades Park" was created, the New York legislature acting in conjunction with that of New Jersey; Stony Point Park was purchased and dedicated; much valuable "Greater New York" charter revision was accomplished; a new Terminal House Act was passed, introducing a number of radical changes and drastic provisions were passed looking to the suppression of anarchy.

1905-06. Frank W. Higgins, governor. This administration was chiefly notable for the preliminary insurance investigation and initiatory discussion of direct primary and direct nomination legislation.

1907-10. Charles E. Hughes, governor (two terms, but the last incomplete by his resignation in October 1910 to accept the office of justice of the Supreme Court of the United States.

Horace White, lieutenant-governor, filled out the rest of the term). The administration of Governor Hughes was one of the most important of any since the war. His first act was an attempt to remove Otto Kelsey, the State superintendent of insurance, for inefficiency, which the senate refused to ratify, and Mr. Kelsey refused to resign. A bill for making the salaries of women teachers equal to that of men in the same grade was vetoed. A long continued struggle was carried on through the latter part of his administration to secure the enactment of some form of direct primaries bill, a special session of the legislature even being called in June 1910, but without direct result, the Cobb bill, a compromise, failing of passage by only one vote. A progressive inheritance tax law was enacted. Other noteworthy legislative enactments, inspired for the most part by Governor Hughes, were (1) a law prohibiting gambling at race tracks, passed in 1908; (2) a law authorizing additional railroad construction in New York City, passed in 1909; and (3) the creation of the public service commission to exercise jurisdiction over all matters connected with public transportation and public utilities. In 1910 an act was passed licensing and regulating private banking; the child-labor laws were amended by two acts so that now no minor under 16 years of age is permitted to work in any mercantile establishment, office, hotel or as a messenger for more than 54 hours a week, nine hours a day, or between 7 at night and 8 in the morning. Among important acts of 1911 were the following: A law reapportioning the Congressional districts of the State; a direct State tax of \$6,072,763; a direct primary law was passed, providing for the direct nomination of all party candidates for public office except those voted for by the voters of the entire State, and also excepting town, ward and village officers and school directors and trustees. The candidates for State offices are nominated by State conventions, but the delegates to these conventions are nominated by a direct vote.

1911-12. John A. Dix, governor. The most important legislation of his first year's administration was the passage of a compromise election bill that provides for direct primaries in all but the State offices, which are still left to a convention. Other legislation of importance created commissions to investigate manufacturing conditions in cities of the first and second class, and to look into the production and distribution and consumption of food products in the State.

Laws for highway improvement, pure food products and for rapid transit subways in New York City were passed. Labor laws were passed designed to prevent the working in factories of children under 16 at night and for more than eight hours a day or six days in the week, of males under 18 years of age for more than six days a week or 54 hours in a week, or between the hours of midnight and four o'clock in the morning, of females under 21 before six o'clock in the morning or after nine in the evening, or more than six days in the week or 54 hours in a week.

1913. William Sulzer, governor. The legislative session was one of unusual excitement owing to the removal by impeachment of Governor Sulzer. Lieutenant-Governor Glynn who

succeeded him recommended to the legislature the passing of laws adopting the Massachusetts simplified ballot, the enactment of a law abolishing State conventions in party nominations and a workmen's compensation law—all of which were adopted. Several measures restricting the hours of labor were passed and the construction of certain types of tenement-houses were enacted. Important laws about vocational and industrial education in public schools and for medical inspection were passed. Vital statistics were taken from the control of local authorities and placed under the State department of health. Sales of securities by brokers were restricted by the Anti-Bucket Shop Law, and a commission appointed to examine the subject of pensions for widowed mothers. A department of efficiency and economy in the public service was created.

1914. Martin H. Glynn, governor. Little legislation of importance was enacted at this session, the most important being a law to permit second and third-class cities to adopt optional forms of charters such as those providing for a city manager and a commission form of government. An extra session had to be called to get the necessary appropriation bills through.

1915-18. Charles Whitman, governor. As a result of the report of a former commission established to investigate the question of pensions for widowed mothers a bill was passed providing for such pensions and a child welfare board set up in each county. A bill to set up State-wide prohibition was defeated. The influence of the war in Europe began to make itself felt. A military training commission was created and was to work with the State board of regents in setting up courses in the schools in physical training and in giving instruction in military training not to exceed three hours a week. Laws were passed for the improvement of the State Guard and the Naval Militia. Railroads were prohibited from employing any one who could not read or understand English. The Great European War into which the United States entered in April 1917 affected legislation very much. Bills were passed compelling boys between the ages of 16 and 19 years of age to undergo military training, for taking a military census of the State, for increasing the National Guard, for registering aliens, creating a council of farms and markets, establishing a commission on food production and supply and creating a council for State defense. A bill creating town boards of education and one providing for a school board in every city of the State, and making uniform their powers and duties, were passed, though the former was later repealed in the 1918 session. A department of State police, consisting of four troops of 45 men each, was created. The legislation continued to be much affected by the war and the conditions growing out of it. The discovery made by the military authorities that there were large numbers of people in the State who could not read English led to the proposal of an amendment to the constitution requiring that all voters after 1 Jan. 1920 must be able to read and write English. Bills were passed providing for military training for all boys 16 to 19 years of age; for instruction in patriotism and citizenship in all the schools of the State; requiring all persons between the ages of 18 and 50 to work 36 hours a week at

Two scenes from the construction of the new Storm King highway in the highlands of the Hudson River. useful labor, known as the Anti-Loafing Law; prohibiting the use in public schools of any textbooks containing seditious matter or material showing disloyalty to the United States; authorizing the State food commission to deal in food, and thus regulate the price, and preventing the taking of excess profits known as profiteering. Attempts to have the legislature ratify the National Prohibition Amendment and to pass a minimum wage bill for women and minors and one for restoring the State nominating convention for certain offices failed.

1919. Alfred Smith, governor. Exactly 4,000 bills were introduced at this legislative session, but comparatively few became law. The fact that the governor was a Democrat and the legislative houses both Republican had much to do with the seeming barrenness of the legislative program. At times a few Republican senators bolted their party and enabled the governor to get through some of his measures.

In his message Governor Smith had recommended certain social and industrial welfare legislation, most of which failed of passage. On the other hand, his recommendations for increases in salaries of school teachers in both rural districts and cities went through, as did also the measure for co-operating with New Jersey in the matter of constructing a vehicular tunnel under the Hudson River between New York and New Jersey, and for reorganizing the public service commission in New York City.

The legislature ratified the Federal Prohibition Amendment, passed bills imposing an income tax, providing for the instruction of illiterates and non-English-speaking persons over 16 years of age, establishing State scholarships for soldiers, sailors and marines in the Great War and providing for a bridge over the Mohawk River at Schenectady known as the Great Western Gateway.

Bills providing for municipal ownership of public utilities, for leasing State hydro-electric power to private corporations and for the sale of 3 per cent beer failed of enactment.

EXECUTIVES OF NEW YORK AS COLONY AND STATE

FIRST DUTCH PERIOD.

Adriaen Jorissen Tienpoint, Director ¹	1623
Cornelis Jacobzen Mey, Director	1624
William Verhulst, Director	1625
Peter Minuit, Director General	4 May 1626
Bastiaen Jansz Krol, ² Director General	March 1632

STATE GOVERNORS.

George Clinton	1777-95
John Jay	1795-1801
George Clinton	Democratic-Republican. 1801-04
Morgan Lewis	" " 1804-07
Daniel D. Tompkins	" " 1807-17
John Tayler (acting)	" " 1807-17
De Witt Clinton	" " 1817-22

⁴ Died 5 March 1701.

⁵ Before 1709 the administration of government, when the offices of governor and lieutenant-governor were vacant, was vested in the council, the right to preside being lodged in the eldest councillor.

⁶ From 1702 to 1738 New York and New Jersey had a joint executive.

⁷ John West, seventh Lord De La Warr, was appointed governor in June 1737, and resigned the title in September 1737; but he never came to this country or qualified for the office.

⁸ A military governor during the Revolutionary War, not recognized by the State of New York.

HUGH HASTINGS,
Formerly New York State Historian.

Revised by JAMES SULLIVAN,
Director of the Division of Archives and History of the University of the State of New York.

NEW YORK, N. Y., the chief city of the United States; its largest aggregate population, its richest financial centre and market, its greatest commercial port and its most productive manufacturing area. Moreover, New York holds the same proud position relatively in the whole world. No other city has so large a population within equivalent boundaries; no other city controls so great monetary wealth or buys and sells so great a value of commodities; no other city handles so large a volume of foreign commerce; and no other city manufactures an equal value of commercial articles.

Topography.—The city of New York is located on New York Bay, at the mouth of the Hudson River, and extends to and along the Atlantic Ocean eastwardly from the bay. The whole of the East River and of the Harlem River and the southwesterly end of Long Island Sound are included within its boundaries. The larger part of the city lies east of the Hudson, but Staten Island, lying adjacent to the New Jersey shore, and forming the southwestern shore of the Upper Bay and the northwestern shore of the Lower Bay, is an important section of the city. The East River, so-called, is not a river in the strict meaning of the word, but a strait connecting the Upper Bay with Long Island Sound. Since the cutting of the ship canal between it and Spuyten Duyvil Creek, Harlem River has become a similar tidal connection between the Hudson River and the East River. Other bodies of water lying within the city limits are Newtown Creek, Wallabout Creek, Jamaica Bay, Bronx River and Hutchinson River, besides several smaller streams.

Population.—The people composing this greatest of all cities, by the State census of 1915, numbered 5,047,221. Numerous complaints of omissions on the part of the State enumerators led to a city census by the police department which placed the number at 5,585,772. In 1920 the Federal census placed the number at 5,620,048. This population is made up of three principal groups, the largest being the foreign-born white; the second in size being the native whites born of foreign parentage; the third, the native whites of native parentage. The latest authoritative figures by which these groups may be differentiated are those of the United States census of 1920. In that year the number of foreign-born whites was 1,991,547, out of a total of 5,620,048, or 32 per cent. These foreigners represented over 60 different nations,

the largest groups being: Russians, 479,797; Italians, 390,832; Germans, 194,154; Irish, 203,450; Austrians, 126,739; English, 71,404; Hungarians, 64,393; Swedes, 33,703; Rumanians, 38,139; Canadians, 25,271; Scots, 21,545; Norwegians, 24,500; French, 23,020; Swiss, 9,233; Poles, 145,679; Czechoslovakians, 26,437; Greeks, 21,455; Danes, 9,092; Finns, 10,240; and of all others—Mexicans, Welsh, Portuguese, Belgians, Spaniards, Bulgarians, Australians, Montenegrins, Serbians, South Americans and Central Americans—72,464. The group of native born of foreign parentage numbered 1,873,013. The native whites of native parentage numbered 1,164,834. Negroes numbered 152,467, and Chinese, Japanese and natives of India, 8,118.

The growth of the city, at first slow, has been in a constantly increasing ratio. In 1650 the population was 1,000; at the time of the Revolution it was 22,000; it reached 100,000 in 1815, and 696,115 in 1850. The increase between 1850 and 1890 was 300 per cent; between 1900 and 1910 there was an increase of 1,329,681 or 26 per cent. The official census for 1920 gives 5,620,048. Within the last two or three years the annual increase in New York's population has been about 150,000.

Composition.—Greater New York is composed of five boroughs, each being coextensive with a county of the State. The borough of Manhattan constitutes New York County; the borough of Brooklyn, Kings County; the borough of Queens, Queens County; the borough of The Bronx, Bronx County; the borough of Richmond, Richmond County.

The Borough of Manhattan comprises Manhattan Island, on which the city of New York was founded, together with Blackwell's (Welfare) Island, Randall's Island and Ward's Island in the East River; Marble Hill, north of the Ship Canal, and Governor's Island, Bedloe's Island and Ellis Island in the Upper Bay. Its aggregate area is 21.9 square miles.

The Borough of The Bronx lies on the mainland of New York State to the north and northeast of Manhattan Island, extending from the Hudson River on the west to the East River and Long Island Sound on the east, and northward to the boundaries of Yonkers, Mount Vernon and New Rochelle in Westchester County. Included in its domain are the Brothers Islands, North and South, and Riker's Island, in the East River; and City Island, Hunters' Island and Hart's Island in Long Island Sound. Its total area is 38.87 square miles.

The Borough of Brooklyn, formerly a separate city, and the fourth in population in the United States at the time of its consolidation with New York, occupies the southwestern extremity of Long Island, between the East River and the Atlantic Ocean, and includes Coney Island, which is the southernmost outpost of Long Island, and a part of the numerous islands in Jamaica Bay. It covers an area of 80.95 square miles.

The Borough of Queens, also on Long Island, extends around Brooklyn to the north, northeast and east, from Newtown Creek at the East River, along the latter to and along Long Island Sound, and by a devious line across Long Island embracing the former municipalities of Long Island City, Newtown,

College Point, Corona, Whitestone, Flushing and Jamaica, reaches the ocean at Far Rockaway, which is also included. It includes Berrian Island in the sound, and the remainder of the islands in Jamaica Bay not within the boundaries of Brooklyn. It is by far the largest of the boroughs, comprising 121.11 square miles.

The Borough of Richmond covers Staten Island, Shooters' Island, Prall's Island, Meadow Island, a part of Buckwheat Island, and a few low-lying marshy islets to the west and north, and Hoffman and Swinburne islands in the Lower Bay.

Intercommunication.—The East River, on account of its width the most serious barrier to intercommunication between Brooklyn and Queens on the one side and New York and The Bronx on the other, was for many years crossed only by ferries at several intervals along its shores. It is now spanned by four monumental bridges, ranking as to length of open span with the largest in the world. Three of these, connecting New York with Brooklyn, are suspension bridges; the fourth, connecting New York with Queens Borough, is a massive cantilever structure. The traffic figures of these bridges afford the best idea of the activity of the population which they serve. An official count made by the city on 28 Oct. 1920 showed that the daily both-ways traffic amounted to 919,166 passengers (in surface cars, elevated and subway railway cars, vehicles and afoot); 11,464 subway and elevated railway cars; 13,864 surface cars; and 45,579 vehicles. *The Brooklyn Bridge*, from Park row in Manhattan to Sands and Washington streets in Brooklyn (6,016 feet), carried 161,239 passengers, of which number 1,928 were pedestrians; 3,844 elevated railway cars; 5,856 surface cars; and 5,188 vehicles. *Manhattan Bridge*, from the Bowery at Canal street, Manhattan, to Nassau street near Bridge street, Brooklyn (6,855 feet), carried 253,264 passengers, of whom 932 were pedestrians; 2,740 elevated and subway railway cars; 735 surface cars; and 20,785 vehicles. *Williamsburgh Bridge*, extending from Clinton street, Manhattan, to Havemeyer street, Brooklyn (7,308 feet), carried 404,229 passengers, of whom 981 were pedestrians; 3,680 elevated railway cars; 5,971 surface cars; and 1,748 vehicles. *Queensboro Bridge*, from Second avenue at 59th and 60th streets, Manhattan, to Crescent street, Long Island City, Queens (7,449 feet), carried 100,434 passengers, of whom 967 were pedestrians; 1,192 elevated railway cars; 1,302 surface cars; and 17,858 vehicles. The completion of these bridges resulted in the closing of some of the former ferry lines between the Brooklyn and Manhattan sections, but there are still in operation eight ferries across the East River, which, in 1916, transported 15,535,598 passengers between Manhattan and Brooklyn; 5,364,858 between Manhattan and Queens; and 21,449 between The Bronx and Queens. Two pairs of subway tunnels for electric cars connect Manhattan with Brooklyn, and one pair Manhattan with Queens.

Communication between Manhattan and The Bronx is maintained by eight roadway bridges, two elevated railway bridges and two pairs of subway tunnels, all crossing the Har-

lem River and its connecting ship canal. These bridges each carry a both-ways traffic ranging from 25,000 to 40,000 persons daily, besides a vehicle traffic of from 3,000 to 12,000, and from 450 to 3,000 surface cars.

The principal transportation systems connecting the various parts of the city are the subway lines, which, in part, are also elevated lines, or, more correctly, make use of elevated structures where engineering exigencies demand it. The long, narrow island of Manhattan has two subway lines, one near the east side of the island, the other near the west side. The former is known as the Lexington Avenue line and the latter as the Seventh Avenue-Broadway line. These are both four-track lines in the lower part of the city, local trains making frequent stops using the two outer tracks, and express trains, making few stops, the inner tracks. A very large part of the service of the local trains is the gathering of passengers between the express stations, at which points nearly the entire load of the local train will disembark and continue their journey on the express trains; with the result that the express stations in the lower part of the city suffer extreme congestion at the "rush hours"—the hours when employees and clerks are going to and returning from their place of business. Both of these subway systems continue at the lower end of Manhattan through tunnels under the East River to the same terminal at Atlantic avenue in Brooklyn, where connection is made under the same roof with the Long Island Railroad. This railroad conducts from this point a rapid transit service to Jamaica, connecting with electric and steam trains to all parts of Long Island. Electric trains from the Jamaica station of this railroad run directly to the Pennsylvania Railroad station at Seventh avenue and 33d street in Manhattan, and several steam trains from Long Island points continue west through Jamaica to Long Island City, making a number of stops for local traffic.

Besides the subways Manhattan has four longitudinal lines of elevated railroad in the lower part of the city—the Second Avenue and Third Avenue lines on the east side and the Sixth Avenue and Ninth Avenue lines on the west side. At 53d street the Sixth Avenue line joins the Ninth Avenue, which continues by a somewhat devious route to a terminal at 155th street and Eighth avenue. The Second Avenue line joins the Third Avenue line at 129th street, and thence trains continue to 183d street in The Bronx. These elevated structures carry a central third track on which express trains are run southward in the morning and northward in the evening. With the exception of Fifth avenue, Park avenue and part of Madison avenue, practically every avenue running lengthwise of lower Manhattan has a line of surface cars. Fifth avenue is served with the double-decked motor busses of the Fifth Avenue Coach Company, running from two lower downtown terminals—Washington square and the Pennsylvania Railroad station (32d street)—along Fifth avenue to 110th street and Riverside Drive from 72d street to 135th street, and upper Broadway to Fort George (190th street).

The movement of travel over these transit lines is so great as to amount to congestion, not

only in the "rush hours" but at other times through the day. Several of the lines run all night and are well patronized at all hours. In 1922 (the latest complete figures available) the subway systems carried 644,975,474 passengers; the elevated roads 348,517,216; the surface cars, 388,357,767; and the Fifth avenue busses, 52,840,135. The Bronx surface-car lines, most of them connecting with the Manhattan lines, carried 84,535,787.

In Brooklyn and Queens the transit lines spread out fanwise to cover the more expansive territory. The Fourth Avenue subway serves South Brooklyn and reaches 57th street in Manhattan by a subway under Broadway; from there it turns eastward to Queens. The northeastern section is served by elevated and surface lines radiating from the great bridges and tunnel termini. The Brooklyn travel in 1922 amounted to 444,747,228 elevated and subway passengers, and 472,538,068 surface-car passengers. In Queens the surface cars carried 58,826,451 passengers on lines independent of the Brooklyn lines. Other lines not accounted for in this classification carried over 2,000,000 passengers. The total number of fare-paying passengers in the Greater City, exclusive of those traveling on the Long Island Railroad to local stations, amounted to well over 2,000,000,000; the number traveling on transfers amounted to about 360,000,000.

Communication with Richmond Borough is maintained by a municipal ferry line, running from Battery Park, Manhattan, to Saint George, Staten Island. The distance is about five miles. This ferry carries annually about 17,000,000 passengers and 500,000 vehicles. From Saint George several lines of surface cars traverse the island.

Communication with New Jersey points on the west shore of the Hudson is accomplished by a number of ferries operated by the railroads whose terminals are on the New Jersey side of the river, and by the tunnels of the Hudson and Manhattan Railroad, popularly known as the "Hudson Tubes." There are four of these tunnels, an uptown pair and a downtown pair. The uptown, or northerly pair, reach Manhattan at Morton street, proceeding thence to Christopher street and then under Sixth avenue northward to 33d street, with an ultimate terminal (projected) at Times square. The downtown tube enters Manhattan at Cortlandt street and traverses a loop just west of Broadway to Dey street, from which the return tunnel departs. In 1922 the ferries from New Jersey carried over 100,000,000 passengers and the Hudson tubes 99,104,889. The ferries carry also an immense freight traffic, figures for which are not available. A large part of this is motor trucking from the New Jersey manufacturing plants within a radius of 40 miles, besides the freighting by New York firms from the railroad terminals along the New Jersey shore. This movement is discussed more particularly under the subheading *Commerce*, in this article.

New York City is connected with the country at large by several trunk-line railroads, two of which, the New York Central and the Pennsylvania systems, have stations in the heart of Manhattan. The Erie, West Shore, New York, Ontario and Western, Lackawanna, Central Railroad of New Jersey and Lehigh Valley sys-

tems have terminals on the New Jersey shore, opposite Manhattan, and connected intimately with the city by both passenger and freight ferries. The New York, New Haven and Hartford trains use the Grand Central station as a passenger terminal, and this line has a connection with the Pennsylvania Railroad's yard in Queens over the New York Connecting Railroad's viaduct and bridge over the East River at Hell Gate.

Principal Streets and Buildings.—The borough of Manhattan, within which is comprised the business and civic centre of the city, is laid out above 14th street in rectangular streets, but exhibits at its lower end a peculiar huddle of short streets laid out apparently without plan, and short blocks of almost every conceivable shape and size. This condition is a legacy of the days when the great city was a country town whose rambling roads were held in their purposeless confines by the title deeds of the adjacent "lots," destined to be the most valuable in the world. Out from the southern boundary of this tangle springs straight away to the north, New York's most popular street, Broadway. It is the one thoroughfare which traverses the city from end to end—from the Battery to the extremely northerly boundary at the Yonkers line, 16 miles distant; and it continues into and through the latter city under the same name. A few blocks to the north of its starting point Broadway passes the westerly end of Wall street, known by name at least, the world around. As the location of the great financial interests of the nation, its influence has so expanded during the European War that it may now truthfully be styled the financial centre of the civilized world. Wall street is not much of a street in its dimensions. It is but little more than 30 feet in width, and its length is less than half a mile. Two short blocks from its Broadway terminus, Broad street branches off toward the south, extending the financial area somewhat in that direction; while toward the north Nassau and William streets offer additional frontage for some of the thickly clustering banking institutions.

Half a mile north of Wall street Broadway passes to the west of the City Hall in its snug little park, with Park Row and Printing House Square to the east, of some fame as the home of several of the great metropolitan newspapers. Beyond the City Hall, Broadway makes a bee-line for Tenth street, where its bend toward the west is marked by Grace Church and its rectory in a spacious lawn. In this leap of one and three-eighths miles has been passed another of New York's historically famous streets, the Bowery. It lies parallel with Broadway and a few blocks to the eastward. A scant quarter-mile to the west lies old "Greenwich Village," another maze of short and crooked streets running hither and yon, as did the highways and byways in the olden time when the village flourished as a choice residence suburb of the growing city. Four blocks above Grace Church Broadway is halted by Union Square which lies squarely across it, but beyond the Square it forges on again in a northwest trend, and with many a slight swing to east and west, following the route of the old Albany Post Road. Above Fourteenth street the mathematical devotion of the city's engineers is in evidence in the

rigidly rectangular blocks of uniform width, and differing in length only as compelled by the location of the starting points of the longitudinal avenues. Broadway alone refuses to follow the path of rectitude, but goes meandering diagonally across block, street and avenue for over three miles before it consents to run parallel with any of the surveyors' lines.

At Twenty-third street Broadway intersects Fifth avenue, another of New York's most famous streets. The latter has come from the Washington Arch on Washington Square, nearly a mile to the southward, and from this point runs straight to the Harlem River, at 141st street, a total distance of nearly seven miles. Broadway continues onward in its characteristic bias to Thirty-third street where it crosses Sixth avenue at an acute angle, and this is one of the busiest section of the city, the terminal of the Hudson tubes, the location of the largest department stores, with some of New York's most famous hotels within a stone's throw. The far-famed former home of the New York Herald stands in the narrow angle between the two streets, and Broadway passes to the west of it, expanding at this point to a magnificent width worthy of its name. At 43d street Seventh avenue is crossed and from this point almost to Central Park, at 59th street, is called the "Great White Way" from the thousands upon thousands of electric lamps woven into scores of scintillating advertising signs of most ingenious construction, bordering it along this stretch. At 59th street Broadway joins its area with that of Eighth avenue to form the spacious Columbus Circle, at the south-western entrance to Central Park. From this junction Eighth avenue continues along the west side of the park under the name of Central Park, West; presenting along its western border a series of palatial apartment houses of majestic height and ornate construction. Broadway emerges from the Circle with its diagonal bent which it pursues to 78th street, where it is but two blocks from the Hudson River. From this point it bears toward the east, running between and nearly parallel to West End avenue on the west and Amsterdam avenue on the east. At 104th street Broadway resumes a devious course swinging now toward the Hudson and again away from it, with now and then a majestic stretch of noble width dividing on either side of a median line of grassy parklets. Eventually it crosses the Harlem River at Kingsbridge into The Bronx, and thence runs to and along the western edge of Van Cortlandt park, and so into Yonkers at 262d street—a total distance from its starting point at Bowling Green of nearly 16 miles, the longest continuous street in any city in the world.

The cross streets of Manhattan north from the Greenwich village zone are numbered consecutively and this decorous arrangement is continued through the western section of The Bronx to the Yonkers line, in the immediate vicinity of the park, but between Broadway and the river, here a distance of somewhat more than a mile, there is a delightful area where the streets partake of the character of the indefinitely winding roads of a great park. Between the Harlem and the Bronx rivers there are many little tangles of streets marking the former "cross roads" of village settlements,

the spaces between filled in with "city blocks" of parallel sides and with right-angled corners. East of the Bronx River there were only a few oldtime country roads to disturb the surveyors, and the layout of the streets is quite mathematical in design.

In Brooklyn, aside from the splendid parkways mentioned in another section, perhaps the most notable street is Flatbush avenue, which traverses the borough from the East River on the northwest to Jamaica Bay on the southeast, in a nearly direct line. As now laid out Flatbush avenue is nearly eight miles long, and its extension across Jamaica Bay, from island to island, will add another mile, or more. It is a thoroughfare of handsome width, and in the old Flatbush section is bordered by mansions set in spacious grounds. Myrtle avenue is another of Brooklyn's longest streets, extending from Borough Hall about eight miles to the Queens boundary at Forest Park. Broadway is the principal street of the former Williamsburgh section, and is five miles in length. In the development of South Brooklyn, Fourth avenue, with its subway, has become one of the most important business thoroughfares: it is six miles in length.

In the borough of Queens one of the oldest as well as the longest streets is Jackson avenue, running from the southwest corner of the borough at Newtown Creek northeastward six miles to Flushing Creek, and thence onward through the former town of Flushing nearly six miles further to the city boundary. Queens Boulevard is a spacious avenue, starting a mile from the East River, as an extension of 12th street, and running in a tortuous line in a generally southeasterly direction seven miles to its junction with the old Jamaica turnpike, now Jamaica avenue. The Grand Central Parkway is referred to in the section treating of the city's parks.

The notable buildings of New York may be classified within three groups: (1) the "skyscrapers," or tall steel-frame structures; (2) those prominent because of architectural excellence and beauty; (3) those of historic interest. The last-named class will be discussed in the section of this article treating of the history of the city.

The development of the skyscraper type was due to the immense demand for office room in the limited area of lower Manhattan. Competition for this area raised the value of the land per square foot to such figures that only a very tall building could return a profitable income from the investment. The same condition was the cause of the clustering of these great buildings chiefly in the downtown section, where office room was most in demand. As seen from the rivers on either side of the island this group of towering structures is dominated by the prodigious mass of the Equitable building, on Broadway at Pine street. It is of 37 stories, and reaches a height of 485 feet six inches above the sidewalk. Reckoning by floor space this building is the most spacious in the world. The tallest point in this particular group is reached by the tower of the Singer Building, near by, a pile of 41 stories attaining an elevation of 612 feet. The slender proportions of this building are augmented by the bulk of the City Investing Building standing close beside it, with 34 stories and a height of over 486 feet.

The southern outpost of this architectural uplift is the noble Whitehall building facing Battery park on the south and the Hudson River on the west, its 32 stories marking a height of 424 feet. The western sentinel of the group, West Street Building, standing among others of modest elevation, reaches a height of 300 feet, 23 stories. In the eastward edge of the group is the Bankers' Trust building of 39 stories, its striking pyramidal roof attaining the level of 539 feet above the curb. The northern escarpment is formed by the sheer white walls of the Western Union building, 28 stories, and 403 feet in height. Within the confines thus outlined, and exceeding 300 feet in height are the Adams building, 32 stories, 424 feet; the American Express Company building, 32 stories, 415 feet; Hanover National Bank building, 22 stories, 385 feet; Liberty Tower, 32 stories, 385 feet; American Bank Note Company building, 28 stories, 374 feet; "Sixty Wall Street," 26 stories, 346 feet; Commercial Cable Company, 21 stories, 317 feet; "Eighty Maiden Lane," 25 stories, 315 feet; and the Columbia Trust building, 23 stories, 305 feet. A score of others, upward of 200 feet in height, add to the mass of this cluster of skyscrapers. For a few blocks north of this main group there is a scattering of gigantic buildings, foremost among them the Woolworth building, of 51 stories, its tower reaching 750 feet in elevation above the sidewalk. This is New York's tallest building, and, indeed, is the tallest structure in the world excepting the Eiffel Tower in Paris. Eastward are the Saint Paul building, 26 stories, and 308 feet high; the Park Row building, 29 stories, 309 feet, and the Sun building, 23 stories, 306 feet. About 200 yards north of the latter is the immense Municipal Building, housing 36 of the city departments and bureaus. It covers the two city blocks from Tryon Row to Duane street, spanning Chambers street at Centre street with a great triple arch. It has 41 stories and is surmounted with a tower and statue, bringing its height to 560 feet. The other area in which skyscrapers have become notably numerous is along 42d street at its junction with Broadway, and in the neighborhood of the Grand Central Station. The tallest of these buildings is the Bush Terminal Sales building, reaching a height of 460 feet. Others of remarkable proportions are the Times Building, 28 stories, 410 feet; the Heidelberg building, 30 stories, 410 feet; Architects' building, 32 stories, 390 feet; the Hotel Commodore, 28 stories, 330 feet; the Biltmore Hotel, 26 stories, 305 feet; the World Tower, 29 stories, 335 feet; and the Lewishohn building, 22 stories, 298 feet. A number of other office buildings in the close vicinity of the Grand Central Station, ranging from 20 stories upward, are between 250 and 300 feet in height. In other parts of the city the skyscraper is only occasional: the most important of these isolated examples being the Metropolitan Life building, 700 feet high; and for several years the tallest building in New York. However, 12 to 20-story loft buildings are quite common, and give a characteristic impression of imposing massiveness and substantiality.

Among the buildings which have been commended for their architectural excellence there are a goodly number in the heart of the downtown business district. Prominent among them

NEW YORK CITY

The New Municipal Building. The City Hall in the Foreground

NEW YORK CITY

The New York Custom House

are the Custom House, at the southern end of Broadway; the Produce Exchange, nearly opposite; Trinity Church, at the head of Wall street; the United States sub-treasury, on Wall and Nassau streets; the National City Bank, occupying the majestic granite building at Wall and William streets, erected about 1840 for the Merchants' Exchange, and covering a whole block; the chastely substantial banking house of J. P. Morgan and Company, at Wall and Broad streets; the elegant marble Stock Exchange across the way on Broad street; the New York Clearing House, a handsome marble structure on Cedar street; and the Chamber of Commerce, of granite and marble, on Liberty street. Farther north is the unique city hall, built of marble, and cherished as an especially fine and pure example of the architecture of the early 19th century. The Hall of Records near by is also notable for its architectural merit. In this connection the peculiar elegance of the great Woolworth building should be mentioned as a most successful combination of an ecclesiastic treatment of the utilitarian design of the multicellular office building. Grace Church on Broadway at 11th street and the Church of the Ascension at Fifth avenue and 10th street deserve special mention in this classification. On Madison square, East, at 25th street, is the exquisite building of the New York State Appellate Court; and two blocks north, Madison Square Garden, noted for its old Spanish façades and tower. The Knickerbocker Trust Company building, on Fifth avenue at 34th street is of a noble type, and the Tiffany and Gorham buildings at 37th and 36th streets are masterpieces of adaptation of dignified models to modern business requirements. A block away toward the east is one of the choicest architectural gems of the city, the Morgan Library on 36th street. It is of white marble and of classic type. The former Herald building, modelled after a famous Italian palace, at Broadway and 35th street; the Knickerbocker Building, at Broadway and 42d street; and the sculptured front of the New Amsterdam theatre—all of these are of special architectural interest. The Hotel Astor, a block above and *The New York Times Annex* must also be included in this group.

The superb New York Public Library building is discussed and illustrated in a separate article.

The Grand Central Station on 42d street and Park avenue is one of the city's finest achievements of the architect's skill—a rare combination of massive solidity and grace. The Biltmore Hotel, although a skyscraper, is a fine architectural production. On Fifth avenue at 43d street is the Temple Emanu-El, a notable development of the Saracenic motive. The Collegiate Church of Saint Nicholas at 48th street; the great Saint Patrick's Cathedral, 50th to 51st streets, and Saint Thomas's Church at 53d street—all on Fifth avenue—and the newly completed Saint Bartholomew's Church on Park avenue at 50th street, are each in their peculiar style superior examples of the church-builder's art. Fifth avenue in this section still retains some of the elegant mansions of the wealthier residents, notable among them being the Vanderbilt homes at 51st and 52d streets and at 58th street. The immense Plaza

Hotel on 59th street facing Central Park belongs in the class of New York's superlative buildings. At 62d street and Central Park West is the uniquely beautiful Century Theatre. Above 59th street, on both sides of Central Park are churches, hotels, clubs, apartment houses and private residences, too numerous for individual mention. Note must be made, however, of the great cathedral-like church of Saint Paul the Apostle (Roman Catholic), on Ninth avenue, 59th and 60th streets. It is regarded as one of the most majestic in the city.

A rapid review of the buildings of salient importance and excellence in this upper section of the city would include: the American Museum of Natural History, on the 77th street side of Manhattan square; the Metropolitan Museum of Art, on the Fifth avenue side of Central Park, at 82d street; the 8th Regiment Armory on Park avenue at 94th street; the cathedral of Saint John the Divine, on Amsterdam avenue, 110th to 113th street; Columbia University Library, 116th street near Broadway; the College of the City of New York, Amsterdam avenue, 138th to 140th streets; and the Hispanic Society's building on 155th street near Broadway. Lesser buildings of distinction throughout the city would number hundreds, but the necessary limit of this article prevents any particular reference.

Parks, Parkways and Playgrounds.—The park area in the greater city comprises 7,818.66 acres, valued at over a half a billion dollars. This area is well distributed, the larger parks, however, being in the newer sections. Manhattan has 32 sizable parks covering 1,487 acres, of which some 200 acres are still unimproved. The largest single area is Central Park, 843 acres, lying between Fifth avenue on the east and Eighth avenue on the west, and extending from 59th street on the south to 110th street on the north. It represents a cost to the city of over \$15,000,000. In the southwestern part is a playground and carousel for children, and beyond is the common lawn of 16 acres. The menagerie is in the southeastern part. The Mall is a broad parade over a quarter of a mile long, bordered by double rows of great elm trees and adorned with a number of statues, busts and other sculptures. The Terrace, a pile of richly carved masonry, with a spacious staircase connects the Mall with the lake, a picturesque body of water covering five acres. Beyond the lake is the Ramble, of 36 acres. Farther north is the Belvedere with its tower of stone, standing at the south end of the city reservoirs. To the left is seen the American Museum of Natural History (q.v.), located in Manhattan square, west of the park. Opposite the lower reservoir and to the east is the Obelisk, and near it, on Fifth avenue at 82d street stands the Metropolitan Museum of Art (q.v.). The upper reservoir extends across nearly the whole width of the park and is half a mile in length. North of it lies the spacious North Meadow, an unbroken sward of nearly 20 acres. The Harlem Mere, a lake of about 12 acres, fills out the northeast corner of the famous park. The other principal parks in Manhattan are Riverside Park, lying along Riverside Drive and overlooking the Hudson River, from 72d street to 129th street, 140 acres; Morningside Park, 31.2 acres; Battery Park,

21.2 acres; Mt. Morris Park, 20.2 acres; Thomas Jefferson Park, 15½ acres. Besides these are the unimproved High Bridge Park, 75.8 acres; Fort Washington Park, 40.8 acres; and Saint Nicholas Park and its extension, 27¼ acres; Riverside Drive extension, 24 acres; and an unnamed park area of 23 acres north of High Bridge. Besides the smaller parks not specifically mentioned here Manhattan has 55 playgrounds scattered about its demesne.

Brooklyn has 54 parks and playgrounds, covering a total area of 1,153 acres. Prospect Park, 526 acres, is the largest and is famed for its peculiar beauties of landscape and remarkable display of flowers, as well as for its wonderful views of New York's unequalled harbor. The larger of Brooklyn's other parks are Dyker Beach Park, on Gravesend Bay, 139.8 acres; Gerritsen Basin, on Jamaica Bay, 123 acres; Brooklyn Botanic Gardens, 61.39 acres; Coney Island Concourse, 59.7 acres; Highland Park, 46.05 acres; McCarren Park (and playground), 38.4 acres; Canarsie Park, 30.5 acres; Fort Greene Park, 28.9 acres, and Sunset Park, 24.5 acres. Brooklyn has 16 parkways, the most famous being Ocean Parkway, from Prospect Park to Coney Island, Fort Hamilton Parkway, from Prospect Park to Fort Hamilton, and the Shore road, from Coney Island to Fort Hamilton.

The borough of the Bronx has the largest parks as well as the largest park acreage in the city—a total of 3,929 acres. Pelham Bay Park, in the extreme northeastern section comprises 1,756 acres with eight miles of water front; Van Cortlandt Park, lying along the eastern side of Broadway on the northern boundary of the city, famous for its golf links, 1,132 acres; Bronx Park, on the Boston road at 180th street, 719 acres; Crotona Park, 155 acres; Claremont Park, 38 acres; Saint Mary's Park, 34 acres; and Macomb's Dam Park, 27 acres. In the southeastern section of Bronx Park an area of 264 acres is devoted to the New York Zoological Park, the largest of its kind in the world in point of space and number of specimens. There are 28 buildings and 14 groups of open air corrals, dens and aviaries. On 1 Jan. 1918, 1,130 species were represented by 4,054 living specimens. The number of persons visiting the collections in 1917 was 1,898,424. An area of 380 acres in the northern part of Bronx Park constitutes the New York Botanical Garden, in which are extensive classified plantations, large greenhouses and a botanical museum with many thousands of specimens of vegetable growth of all preservable kinds. The Bronx is especially rich in parkways. The Bronx River Parkway Reservation is the largest of these, extending from the northerly line of the botanical garden along both banks of the Bronx River 15½ miles to the Kensico reservoir. The Grand Boulevard and Concourse connects the Central Bridge district of Manhattan with the Moshulu Parkway. Its approach is through Cedar Park, 400 feet wide, for three-fourths of a mile and thence 182 feet wide, for 4½ miles. The Moshulu Parkway connects Van Cortlandt Park with Bronx Park: it is 600 feet wide and two and one-third miles long. The Bronx and Pelham Parkway connects Bronx Park and Pelham Bay Park: it is 400 feet wide and nearly four miles long. Spuyten Duyvil Parkway runs

from Van Cortlandt Park to and southward along the crest of the high ground, two and one-half miles to the heights north of Spuyten Duyvil Creek: it is 180 feet in width. Crotona Parkway is three-fourths of a mile in length, and 100 feet wide, running along the westerly boundary of Crotona Park.

Queens borough has 1,178 acres in parks. Forest Park is the largest, 536 acres, and is a fine piece of natural woodland, nearly all in the wild state. The Jacob Riis Park at Neponset, (on the sea) has an area of 263 acres. Of the other park enclosures, Kissena Lake Park (Flushing), 88 acres; Baiseley's Pond, 75 acres; Highland Park, 65 acres, and Astoria Park, 56 acres, are the largest. Queens has also the magnificent Grand Central Parkway traversing the entire width of the borough from Forest Park eastward, eight miles to the city line.

Richmond has but four parks, the only large one being Silver Lake Park of 56 acres; most of this is unimproved.

Monuments and Sculptures.—The most widely known of New York's monuments is the Statue of Liberty on Bedloe's Island in the Upper Bay. Thousands of pictures of this statue have been scattered broadcast all over Europe, as well as in this country. Next to that in point of wide familiarity is probably Grant's Tomb, on Riverside Drive. The Obelisk in Central Park is also well known. The Washington Arch, at the Fifth Avenue entrance to Washington Square, is the noblest of the city's monumental structures. The Maine Memorial Monument, at the southwestern entrance of Central Park, is of modern design and imposing proportions, a highly creditable construction of granite, marble and bronze. The Worth Monument, at 26th street, in the angle between Broadway and Fifth avenue marks with a simple granite shaft the grave of General Worth. The more important of the other monuments in Manhattan are the Soldiers and Sailors' Monument, and the Firemen's Memorial on Riverside Drive, at 89th street and 100th street, respectively. Among the statues should be first mentioned the equestrian statues of Washington, at Union Square; of Sherman, at the southeast entrance to Central Park; of General Sigel, and of Joan of Arc on Riverside Drive. Scattered about the city, chiefly in the parks, are statues of Columbus, Benjamin Franklin, Daniel Webster, Horace Greeley, Garibaldi, Alexander Hamilton, Farragut, Shakespeare, Lafayette, and the group of Sir Walter Scott and Robert Burns (in Central Park). Busts are much more numerous and include among others those of Audubon, Beethoven, Edwin Booth, William Cullen Bryant, Darwin, Ericsson, Washington Irving, Mazzini, Commodore Peary, Schiller and Verrazano. Prominent among the sculptures are The Pilgrim, The Still Hunt, The Indian Hunter and The Falconer—all in Central Park. The Bethesda Fountain on the Esplanade in Central Park, the Pulitzer Memorial Fountain, the Strauss Memorial and the Richard Morris Hunt Memorial exemplify another type of sculpture in which the city is very rich. The great bronze memorial of Commodore Vanderbilt, 150 feet long and 30 feet high, is on the wall of the Varick Street terminal.

Brooklyn has a magnificent memorial arch of the Soldiers and Sailors' at the main en-

trance to Prospect Park, a fine equestrian statue of Washington on the plaza of the Williamsburgh Bridge, the Lincoln Memorial with a seated statue, and the Prison Ship Martyrs' Monument in Fort Greene Park. See BROOKLYN.

Municipal Service and Improvements.—The streets of New York have a total length of 3,543 miles, of which 2,226 miles are paved. The total length of the city's sewers is 1,577 miles. The department of street cleaning which takes care of the streets and the removal of rubbish, garbage and ashes, employs about 3,000 sweepers popularly known from their white duck uniforms as "white wings," while 1,800 drivers collect the refuse. The annual cost of this department is \$3,450,000. The garbage is converted into grease and fertilizer on Barren Island in Jamaica Bay, the ashes and rubbish are used as "land filler," 65 acres of land having thus been reclaimed at Riker's Island in Long Island Sound. The department of water supply, gas and electricity, supervises the illumination of the city by private companies and supplies water of which Greater New York consumes daily (1918) 617,000,000 gallons; over 100 gallons for each person. The city owns its waterworks including 2,984 miles of mains, exclusive of the high pressure fire mains, more than 100 miles. The water supply of Manhattan, received formerly only from the Croton watershed with an area of 360 square miles, 30 miles north of the borough, is supplemented since 1916 by the Catskill aqueduct 92 miles long, tapping the watersheds of the Esopus and Rondout creeks, in the southern Catskills affording an additional capacity of 700,000,000 gallons a day and bringing the city's daily supply up to 955,000,000. The Catskills water is distributed to all of the boroughs of the city. The Ashokan reservoir on Esopus creek, 12 miles from Kingston, has a water surface of 12.8 square miles and an average depth of 50 feet. When full it holds enough water to last the city 335 days at the present rate of consumption and is used for impounding the water. The Kensico reservoir is used for storing the water; the Hill View reservoir in Yonkers for equalizing and distributing, while the terminal reservoir at Silver Lake on Staten Island 225 feet above sea-level, is used for distributing. The entire cost of this gigantic undertaking, including the watershed area purchased was \$138,154,089. The cost of the Croton water system was \$192,021,000, making the entire outlay for the city's water supply up to 1918, \$330,175,089. As the need arises it has been arranged to connect the watersheds of the Schoharie and the Catskill creeks with the Ashokan aqueduct, thus insuring an abundant supply for many years to come. There is no municipal lighting system. The city contracts with the commercial companies for this service. In 1918 the cost was \$825,000 for gas and \$2,330,000 for electricity. The city supports free public floating baths on the Hudson and East rivers, which are used annually for five to six million baths between June and September. There are also free interior permanent baths. All these conveniences help to keep the city death rate down to about 14 per 1,000. The birth rate is 21.60 per 1,000. The police department numbered in 1918, 10,884 men. The waterfront is protected by patrol steamers, launches and skiffs, active principally

at night. In 1918 the arrests numbered 187,913. The department in that year cost \$20,146,892. The fire department in 1918 numbered 5,039 paid men, with 931 volunteer firemen in Queens and Richmond. Horse drawn apparatus has been almost entirely replaced by motor equipment. The cost of the fire department in 1918 was \$9,119,285.

Industries and Manufactures.—The industries of New York are of the widest variety. The city's industrial supremacy is due chiefly to its immense volume of light manufacturing, most of it done in small factories. The United States Census of Manufactures for the year 1919 reported 32,590 manufacturing establishments of factory grade, covering about seven-eighths of the listed industries of the entire country. Of the whole number, 13,346 employed less than six hands, and 8,967 between 6 and 20 hands. Only 39 had more than 1,000 hands; 73 from 500 to 1,000; 179 from 250 to 500; 635 from 100 to 250; 1,333 from 50 to 100; and 3,766 from 20 to 50 hands. The entire number of persons occupied in manufacturing was 825,056, of whom 638,775 were wage-earners; receiving annually as wages and salaries the sum of \$805,822,000. Of the wage-earners 468,444 were males and 230,665 were females. Workers under 16 years of age numbered 3,125. The capital invested aggregated \$3,038,557,492. The cost of materials used was \$2,801,619,388; the value of products was \$5,260,707,577. The horsepower employed was 718,577. The fuel used was 2,169,218 tons of anthracite and 2,037,155 tons of bituminous coal; 235,079 tons of coke; 5,009,999 barrels of fuel oil; 33,818 barrels of gasoline; and 1,990,842,000 cubic feet of gas. The wholesale manufacture of clothing leads in point of value of product; over half of the clothing worn in the country being made in New York City. The value of women's clothing produced in 1919 was \$866,243,561; and of men's clothing, \$480,596,385. Printing and publishing held second place in value, with a total of \$345,989,264. Other leading industries with the value of the output are: slaughtering and meat packing amounting to \$191,838,000. Bread and bakery products, \$173,510,009; foundry and machine shop products, \$155,595,000; tobacco manufactures, \$146,033,207; millinery and lace goods, \$162,186,055; fur goods, \$132,145,251; patent medicines and druggists' preparations, \$75,280,000; coffee roasting and spice grinding, \$51,225,279; paints and varnishes, \$56,361,000; confectionery, \$84,564,630; copper, tin and sheet-iron products, \$59,682,000; boots and shoes, \$66,478,600; men's furnishing goods, \$61,472,000; musical instruments and materials, \$40,091,833; furniture and refrigerators, \$42,590,856; lumber and timber products, \$16,615,568; and jewelry, \$65,391,579. Sugar refining, the smelting and refining of copper and the refining of petroleum were also among the industries whose production reached a value of above \$20,000,000; but exact figures are withheld as tending to disclose private affairs. Other leading industries in which the value of the production reaches large figures are: soaps, leather goods, electrical machinery, food preparations, paper and fancy boxes, chemicals, gas fixtures, hosiery and knit goods, marble and stone work, artificial flowers and feathers, and ship and boat building. Allied

to the printing trade also are the fine lithographing, engraving and map making in which New York holds first place in America.

Trade and Commerce.—Nature and man have made New York the main portal of the foreign commerce of the United States, its commercial supremacy being due in large part to its harbor facilities as well as to its geographical location. The city has a water front of 578 miles, divided among the boroughs as follows: Manhattan, 48.2 miles; Brooklyn, 201.5 miles; Queens, 196.8 miles; Bronx, 79.8 miles; Richmond, 57.1 miles. The exigencies of the European War so greatly increased the commerce of the port as to strain severely the accommodations of the water front; of which only 103 miles are now occupied by docks. The wharfage on Manhattan has been within recent years improved by huge piers, notably the range of Chelsea docks, 800 to 850 feet long, extending from 12th to 22d streets, and the 1,000-foot piers between 44th and 59th streets. Large sections of the Hudson River front on the New Jersey side are owned by the great railroad corporations but some of the largest steamships find spacious berths along that shore. Across the East River on the Brooklyn shore are the docks of sugar refineries, factories, warehouses, government storage houses, the famous Brooklyn navy yard, with its great dry docks, and the South Brooklyn terminal basins for canal boats; while the shores of Staten Island also are lined with docks and fringed with piers. In the calendar year 1921 the foreign commerce of the port of New York amounted to \$3,062,521,187—imports, \$1,332,265,342; exports, \$1,730,255,845. As imports of the whole United States were valued at \$2,509,147,570, and the exports at \$4,485,031,356, it is seen that New York handled nearly 53 per cent of the imports and more than 33 per cent of the exports of the nation. In 1922 imports were valued at \$1,365,484,094 and exports at \$1,317,440,816. During year ended 31 Dec. 1921 the number of merchant ships entering and leaving the harbor of New York had an aggregate tonnage of 31,940,000, of which 16,625,000 tons entered and 15,315,000 tons cleared. There are 99 ocean steamship lines having their headquarters in New York and 38 lines of river and coastwise steamers, operating between New York and points on the Atlantic and Pacific coasts, Long Island Sound and the Hudson River, and ports in Central and South America, Europe, Africa, Asia and Australia. The port of New York is also the freight terminal of the main line of the Central Railroad of New Jersey, the Pennsylvania, the New York Central, the Erie, the New York, New Haven and Hartford, the West Shore, the Delaware, Lackawanna and Western, the New York, Lake Erie and Western, the Long Island and the New York, Ontario and Western railroads. See NEW YORK, HARBOR OF.

Government.—The charter of New York, as revised by the legislature in 1901, follows, in the main, the lines of the charter of the old city, with important provisions adopted from the charter of the former city of Brooklyn and from those of other American and European cities. The greater part of it is the law as it has existed for half a century, and the chief changes have to do with the adoption of the borough system and the policy of giving

control to localities over their own affairs. The executive power is vested in the mayor, the presidents of the boroughs and the heads of the departments. The mayor, who holds office for four years and is eligible for re-election, appoints the heads of departments and commissioners; except those over which the presidents of the boroughs have jurisdiction, and except also the comptroller or head of the department of finance, who is elected by the people. He can, with few exceptions, remove any official appointed by him, and can himself be removed by the governor, after a hearing upon charges. The mayor has the power of veto over all ordinances and resolutions of the board of aldermen, but an ordinance or resolution can be passed over his veto by a vote of two-thirds of the members of that body, except that when it involves the expenditure of money, the creation of a debt or the laying of an assessment, a three-fourths vote is required. The president of each borough holds office for two years. He presides over each local board in his borough, with the right to vote on and of veto over its actions, and is ex-officio member of the board of estimate and apportionment. He is also a member of the board of aldermen and has the same right to vote as any member elected to that body. The borough president appoints and may at pleasure remove a commissioner of public works for his borough with control of all matters relating to the improvement and repair of streets and sewers. He also has control of the public buildings in his borough except schools, hospitals, penitentiaries and fire and police stations, and exercises the supervision vested in the city over the construction of buildings in his borough, except such powers as are directly vested in the tenement-house commission. The borough presidents also are removable by the governor. The board of estimate and apportionment, besides the functions implied by its name, acts as a general board of directors of the city, determining its policy as to financial affairs, public improvements, franchises and special permits, in which matters it has practically the sole authority. The departments of administration comprise: 1, the board of estimate and apportionment; 2, finance; 3, law; 4, police; 5, fire; 6, water supply, gas and electricity; 7, street cleaning; 8, plant and structures; 9, parks; 10, docks and ferries; 11, public charities; 12, correction; 13, health, including an important division of child hygiene; 14, tenement house; 15, education; 16, taxes and assessments; 17, licenses.

Courts.—The city is included in two of the State judicial districts: the first district is co-extensive with the counties of New York and Bronx; the second district includes (among other territory) the counties of Kings, Queens and Richmond. These are thus a part of the jurisdiction of the Supreme Court of the State. In the first district there are 32 resident justices; in the second district there are 18. There is also a County Court for each county in the city; a city court, with 10 judges; a Court of General Sessions, with seven judges; a Court of Special Sessions, with 12 justices; a children's court, with five justices; 24 municipal courts; and 41 city magistrates. The appellate division of the State Supreme Court has its courthouse in the city; and there are head-

Reed & Stem, Saint Paul, Architects; Warren & Wetmore, Associates

quarters here of two Federal district courts—the Southern of New York and the Eastern of New York; and here also is the seat of the Federal Circuit Court of Appeals of the second district. There is also a Surrogate's Court in each county included in the Greater City.

Finances and Banking.—The total assessed valuation of property within the city in 1923 was \$11,262,171,927—\$10,466,121,527 real and \$796,050,400 personal. This was distributed among the boroughs as follows:

	Real	Personal
Manhattan.....	\$5,950,822,305	\$543,640,100
Brooklyn.....	2,563,258,211	158,718,050
The Bronx.....	952,814,631	60,151,800
Queens.....	842,166,160	27,666,450
Richmond.....	157,060,200	5,874,000

In addition to this tangible wealth the city's tax commissioner listed in 1918 taxable franchises in the several boroughs as follows: In Manhattan, \$262,825,592; in Brooklyn, \$92,659,654; in the Bronx, \$32,097,927; in Queens, \$27,479,195; in Richmond, \$4,411,730—a total of \$439,474,098. The gross funded debt on Jan. 1, 1919 was \$1,506,595,699. The exempt funded debt was \$330,960,860 and the net sinking fund, amortization and redemption funds amounted to \$456,301,050, leaving the total constitutional funded debt, within the debt limit, \$719,293,759; as against the constitutional borrowing limit (10 per cent of the assessed valuation) of \$833,964,285. The 1923 budget adopted by the Board of Estimate, 31 Oct. 1922, totaled \$353,351,813. The debt in 1923 was \$1,067,082,137.

The chief sources of income are property taxes, special assessments, franchises, water rates, docks, ferries and subways. Valuable franchises granted to private companies do not in all cases return a proportionate income to the civic treasury. There are 44 national and 48 State banks, 54 savings banks and 35 trust companies in the city, some of them having several branch establishments. The New York Clearing House Association is composed of 44 banks and 15 trust companies, associated for the purpose of exchanging the checks and drafts they hold against each other. The clearing house is at 77 Cedar street, where it has been in operation since 1853. Banks not members of the association may clear through members. The clearing house transactions for the fiscal year ended 30 Sept. 1918 amounted to: Exchanges, \$174,524,179,929; balances adjusted, \$17,255,062,671; total transactions, \$191,779,241,700. The average daily transactions amounted to: Exchanges, \$575,987,390; balances, \$56,947,402; total \$632,934,791. For many years the leading savings bank was the Bowery Savings Bank, which in 1918 reports total deposits of \$104,422,370 in 142,200 accounts, and a surplus of \$16,771,270. But in recent years this bank has relinquished first place to the Emigrant Industrial Savings Bank, with total deposits of \$168,880,510 in 185,225 accounts, and a surplus of \$14,683,520. There are 11 life and 32 fire and marine insurance companies in the city, besides a number of companies engaged in casualty, credit, fidelity and surety and real estate title insurance. The best known of the city's financial institutions is the Stock Exchange, an association for the exchange of securities for currency or its representatives. The securities bought and sold at the New York Stock Exchange are certi-

cates of stocks and bonds issued under national, State or municipal authority, or by corporations doing business as common carriers, or in banking, mining, manufacturing or other industrial pursuits. In 1918 the par value of shares sold by the exchange was nearly 14 billions, and that of bonds sold \$2,093,257,500. The chief business of its members is buying and selling these stocks and bonds for outside clients, the charge being one-eighth of one per cent on the par value of every transaction. The Stock Exchange is limited to a membership of 1,200. Before 1868 seats on the New York Stock Exchange were not transferred by purchase and sale, but an initiation fee of \$3,000 was required from members. In 1868 the transfer system was instituted and the seats began to have a market valuation. All new members are now admitted through transfer, "seats" being worth from \$77,500 to \$100,000.

Education and Intellectual Associations.—The city has 557 elementary schools; 168 in Manhattan, 194 in Brooklyn, 64 in The Bronx, 102 in Queens and 34 in Richmond. It also has 24 high schools, 4 training schools for teachers, 2 truant schools and 4 vocational schools. The average attendance of pupils in the elementary schools in 1918 was 755,033; in the high schools, 70,366; in the vocational schools, 2,241; in the training schools, 1,029. The annual school appropriation for 1921 included \$60,209,528 for teachers' salaries, \$1,949,666 for supplies and \$1,550,933 for pensions. Besides evening schools, free lecture courses, recreation centres, summer vacation schools and playgrounds and special classes for foreign children are maintained; also rapid progress classes for those in advance of their grade; working paper classes for those who must have extra help to be entitled to working papers; while there are over 140 special classes for the education of mentally defective children. Prominent among the city's higher institutions of learning are the College of the City of New York, popularly known as City College, founded in 1848 as the Free Academy, and for many years on 23d street, now housed in splendid Gothic buildings erected at a cost of about \$4,000,000 on Harlem Heights between 136th and 138th streets and Amsterdam avenue. Free tuition is given by about 250 instructors to an average attendance of 7,000 students at an annual cost of about \$250,000. On Cathedral Heights at 116th street is Columbia University founded by royal charter from George II in 1754 under the name of King's College. This institution is also noted for its fine modern buildings and affiliated connections. The instructors number 1,162 and the average 1918 attendance of students in all departments was 17,604, including the summer school of 5,600, and membership in the extension courses of 4,500. On University Heights on the east bank of the Harlem River is New York University, founded in 1830, and for many years located on Washington Square and University Place, where the Law school is still located. Prominent among the university buildings is the classic Hall of Fame, the gift of Helen Gould, dedicated to the perpetuation of the names of famous Americans. In 1918 the average attendance was 7,778 students, with 493 instructors. At 69th street and Park avenue is Hunter College (named after its first principal, Dr. Thomas Hunter), formerly the

Normal College, founded in 1870 as a free city institution to train girls as teachers; the average attendance of students in 1918 was 1,386, and the number of instructors, 120. Noteworthy also are Fordham University, Manhattan College, the College of Saint Francis Xavier, the Union Theological Seminary, the General Theological Seminary of the Protestant Episcopal Church, and the College of Physicians and Surgeons, while a majority of the hospitals have training schools for nurses. Chief among many institutions of private endowment, is the Rockefeller Institute for Medical Research, endowed by John D. Rockefeller with \$4,000,000 for the advancement of the science of medicine by laboratory investigation, experiment, clinical observation and study. Important factors also in the city's educational development are 163 public and subscription libraries, including the New York Public Library (q.v.) with its 46 branches and the museum collections of many societies. Numerous also are the art and literary associations; chief among them the National Arts Club with 1,450 members; the Art Students League with 1,557 members; the School Art League of New York City with 626 members and 2,790 juniors; the Salmagundi Club of 800 members; the Fine Arts Federation of New York, an association of 15 art societies; the National Academy of Design; the University Club, with 3,800 members; the National Institute of Arts and Letters; the New York Historical Society; the American Geographical Society; the Hispanic Society of America and the Authors' League of America; while there are 30 dramatic and 61 musical clubs, 180 social clubs and as many theaters. Mention also should be made of the many social settlements, some attached to churches, others of a secular nature, found in different thickly settled sections of the city, studying and ministering to the needs of their neighborhoods in recreation, hygiene, education, industry and politics.

Churches.—New York is the see of the Roman Catholic and Russian Greek Catholic archbishops, and of a Protestant Episcopal bishop. In 1918 Greater New York had over 1,700 churches and religious societies. These were distributed as follows: Manhattan and The Bronx, 815; Brooklyn (called the "City of Churches"), 585; Queens, 212 and Richmond 92. As to sect, the Roman Catholic denomination has the largest number of churches—351; the Protestant Episcopal, 217; the Methodist Episcopal, 200; the Baptist, 139; the Presbyterian, 130, and the Jewish, 119.

The Disciples of Christ, Moravians, Universalists, Unitarians, Friends and Christian Scientists each have a number of fine churches. There are also many independent organizations representing every form of religious belief. The finest church building is the Roman Catholic cathedral in Fifth avenue. The New Protestant Episcopal Cathedral of Saint John the Divine, located on Morningside Heights, now partially completed and opened for worship, will be when finished the costliest church edifice in America. Of the others the most notable is Trinity Church, on Broadway at the head of Wall Street, which has the longest continuous history of any parish in the city. It was in 1697 that William and Mary granted a parcel of land "in or near to a street without the north gate of the city, commonly called Broad-

way," for use "as the parish church and churchyard of the parish of Trinity Church within our said city of New York." The church built on this grant was first occupied in 1698. Destroyed in the fire of 1776, the church was rebuilt 12 years later on the original site; but the second building was found to be unsafe in 1839, and in 1846 was replaced by the present structure. The church maintains eight chapels and aids 10 other mission churches in various parts of the city, and conducts industrial and training schools and classes and several guilds.

Charities.—All of the city's charitable institutions except those under the board of health and the association of the Bellevue and Allied hospitals, are administered by the department of charities superintended by a commissioner. Institutional relief is given but no money nor home supplies. The city gives in addition about \$4,000,000 to religious and privately managed hospitals and asylums that receive the city's poor. Largest among the charitable institutions of the city is the Charity Organization Society, which is supported by voluntary contributions and legacies and serves as a centre of inter-communication between various churches and charitable agencies, to avoid overlapping. There are 32 hospitals, refuges and asylums which receive State or municipal aid, and 170 hospitals and dispensaries supported by voluntary contributions and private endowment. Thirty-eight institutions and associations are conducted for the relief of the aged, and 140 for the relief of children. In the latter class mention should be made of the Children's Aid Society, organized in 1853, which has provided 75,000 boys and girls with homes and places of employment, and in its industrial schools given aid and instruction to over 115,000 children; the New York Foundling Hospital, which is controlled by the Sisters of Charity, sheltered during 1918, 4,960 inmates and 582 homeless mothers; and the Society for the Prevention of Cruelty to Children, by which an average of 9,000 complaints are yearly received and investigated. There are 26 organized agencies for the reformation of children, fallen women and intemperate men; these include the Catholic Protectors, where 4,500 children are taught trades and industrial employment, and the House of Refuge where 1,300 boys and girls received upon commitment of the city courts, are given a common school education and industrial instruction. Noteworthy among agencies for rendering special or temporary relief to the poor are the Grace Institute, endowed by William R. Grace in 1897 to furnish women and girls instruction in trades and occupations and which now has 900 pupils; the Legal Aid Society, which gives free legal aid and assistance to those unable to procure the same; the Prison Association of New York, which aids reformed convicts after discharge; the Provident Loan Society which loans on pledges of personal property at 1 per cent a month; the Baron de Hirsch Fund for the benefit of Hebrew immigrants; 15 church and college settlement houses, and the Sailors' Snug Harbor on Staten Island, where a home is provided for 900 aged and decrepit sailors. Mention must also be made of the Society for the Prevention of Cruelty to Animals, founded in 1864 by Henry Bergh, and the parent of similar organizations in many other States and cities.

History.—The first white men known to have visited Manhattan Island, the future site of New York City, were Giovanni da Verrazano, an Italian sailing in the French service, and Diego Gomez, a Portuguese sailing in the Spanish service, both of whom, while seeking a westerly way to the Indies in 1524, entered what is now the harbor of New York. Nothing, however, in the way of colonization came of their voyage. Eighty-five years later, in April 1609, Henry Hudson, an English adventurer in the service of the Dutch East India Company, sailed from Amsterdam as captain of the ship *Half Moon*, with a charge from his employers to seek a water route to the Indies by the north side of Nova Zembla. Ice early blocked his advance into the Arctic, and so, heading westward, a month's cruise brought him, in July, to the coast of Newfoundland. Thence he sailed southward to the James River, Virginia, and, again altering his course, still in pursuit of a new channel to India, came on 11 Sept. 1609 upon the river which bears his name. He anchored for a time at its mouth and then sailed up the stream until warned by shoaling water that he was at the head of navigation, near the present site of Albany; whereupon he turned his vessel southward, and early in October set out on his homeward voyage. Hudson's account of the stores of fine peltries he had seen in the possession of the Indians moved his employers to prompt action, and in 1609 the former mate of the *Half Moon* was sent across to trade with the savages and report further upon the country. Handsome profits attended this venture, and in 1613 the *Fortune* and the *Tiger*, commanded respectively by Hendrick Christaensen and Adrian Block, sailed for the Hudson River, being followed within a year by three other vessels from Amsterdam and Hoven. These carried back to Holland such generous cargoes of furs that their owners hastened to open regular communication with the Hudson River country and to establish posts at its head and at its mouth for the purchase and collection of skins while the vessels were on their voyages to and from Holland. The main post, called Fort Nassau, was located just below the site of Albany; but a smaller fort was built on Manhattan Island, its site being just south of the present Bowling Green. Captain Christaensen was appointed head man over both posts, and he and his half dozen comrades were, therefore, the first white settlers on Manhattan Island. Though Christaensen soon lost his life in a quarrel with the Indians, the trade he had helped to found grew and prospered, and soon the merchants who had first engaged in it joined with others in the formation of the United New Netherlands Company, to which, so far as the power lay with the States-General of Holland, was granted for three years from 1615 the monopoly of the fur trade with the newly-opened country. This monopoly was renewed for a year at a time until 1621, when the Dutch West India Company came into existence, with chartered rights to the exclusive trade of all the coasts of both Americas. The new corporation was, speaking in a broad way, a commercial federation, with branches established in the several cities of Holland. Each branch, though subject to the collective authority of its fellows, was clothed with distinct rights and

privileges of its own, and was assigned a specific territory, over which it exercised the right of government and of trade. Thus, the post on Manhattan Island, with its dependent territory, was assigned to the Amsterdam branch, which at once addressed itself to the development of what had now come to be known as the province of New Netherlands. Accordingly, in 1623, 30 families of settlers were sent out from Amsterdam, and a part of them put ashore on Manhattan Island. More colonists arrived in 1625, men who had come as homemakers and not as transient traders; and to confirm this promise of permanency Peter Minuit was appointed director-general of the colony, with power to organize a provisional government. He arrived at his post in May 1626, at the head of another band of colonists, and having bought Manhattan Island from its Indian owners for a consideration of \$24 he proceeded to christen the infant town New Amsterdam. Recalled from his directorship in 1632, Minuit was succeeded in turn by Wouter van Twiller, William Kieft and Peter Stuyvesant. A savage Indian war in Kieft's time well nigh extinguished the colony, but it made rapid recovery under Stuyvesant, who directed its affairs from 1647 to 1664, and by the year last named the hamlet on Manhattan Island had become a town of 1,000 souls, under the government, organized in 1652, of a schout, two burgomasters and five schepens, while thriving settlements had sprung up on both sides of the Hudson and on the lands about the bay.

The Dutch, however, did not long retain possession of New Netherlands. The English claimed the entire continent as having been discovered by Cabot, and whenever the English and the Dutch were at war New Amsterdam had always to fear the threatened attack of some English squadron. The dreaded blow finally fell in 1664, when Charles II resolved to seize New Netherlands by surprise. In pursuit of this purpose the king made to his brother James, Duke of York and Albany, a grant which included the whole of the Dutch possessions in America, and late in August 1664 a British squadron appeared before New Amsterdam and demanded its surrender. The coming of the English found the town ill-prepared for a siege, and though Stuyvesant wished to fight, even against heavy odds, he was not allowed to have his way. Articles of capitulation were quickly agreed upon, and on 8 September the flag of the West India Company fell from Fort Amsterdam to be replaced by that of England, and Col. Richard Nicolls took possession of the town and province in the name of the English king and for the use of the Duke of York.

New Amsterdam was speedily renamed New York, and in June 1665 the city government was reorganized, in accordance with English customs, by replacing the schout, burgomasters and schepens with a sheriff, aldermen and mayor. Once again, from 30 July 1673 until 10 Nov. 1674, the Dutch were in possession of the town and province; but the Treaty of Westminster finally transferred them from the States-General to England; and the permanent change of ownership was attended by a change of policy which made for the more rapid up-building of the town. One important act looking to this end bestowed on New York the sole

right to bolt and export flour. The Bolting Act remained in force from 1678 until 1694, and during that time it trebled the population of the town, and gave a prosperous permanency to its foreign commerce. According to the provisions of the act no person outside of the city could grind flour for market or pack breadstuffs in any form for sale. The result of this interdict was to throw the considerable and growing export trade in breadstuffs, mainly with the West Indies, wholly in the hands of the millers and merchants of New York, so that during the 16 years that the act remained operative the city revenues more than doubled and the total number of buildings in the town increased from 384 to 983, two-thirds of which depended in one way or another on the trade in flour, while the port's sailing craft grew from 11 to 85 sloops and ships.

It was while the Bolting Act was still in force that, on 22 April 1686, New York received the charter—known as the Dongan charter, because granted through the governor of that name—which still forms the basis of its civic rights. The governor, under this instrument, appointed the mayor and sheriff, but the city was allowed a large quantity of real estate, from some of which it draws a revenue to the present day, while the aldermen were elected by the freeholders of the six wards into which the town had been recently divided, and enacted by-laws for its government. The Dongan charter, amended by Queen Anne in 1708, was further enlarged by George II, in 1730, into the Montgomery charter, which, confirmed by the assembly of the province in 1732, made New York virtually a free city. The mayor until the Revolution was appointed by the governor in council, until 1821 by the governor of the State and four members of the council of appointment, and then for 13 years by the common council of the city. Since 1834 he has been chosen by the people.

The revolution by which, in April 1689, the crown of England passed from James II to his daughter and her husband, bred a popular uprising in New York, and control of affairs passed for the time being from the Crown officers to a committee of safety of 10 members, chosen by the citizens. This committee appointed Jacob Leisler, a leading merchant, captain of the fort, and invested him with the power of commander-in-chief until orders should arrive from the new sovereigns. This arrangement was opposed by the so-called Aristocratic party, whose leaders had been office holders under King James, but without effect, and the government of the town and province remained in the hands of Leisler until March 1691, when Col. Henry Sloughter, who had been appointed governor of the colony by William and Mary, arrived in New York. Leisler declined to surrender the fort unless assured immunity for his acts as governor. This was refused by Sloughter, who had fallen under the empire of the Aristocratic party; many of Leisler's followers deserted him, and he was thrown into prison. A little later, with his son-in-law, Jacob Milborne, and others of his adherents, he was brought to trial charged with treason and murder. All were found guilty by a prejudiced and hostile court, and Leisler and Milborne suffered death on the gallows. Their execution was little less than a judicial murder.

Leisler's son afterward secured an order for the restoration of his confiscated estate, and, in 1698, an act was passed by the Parliament of England which canceled the judgments of the court in New York and sustained Leisler's course as governor. Three years afterward the bodies of Leisler and Milborne, denied funeral honors at the time of execution, were taken from their temporary resting place, near the present site of the *Sun* building, and, after lying in state in the city hall, were with impressive ceremony reinterred in a burial ground which stood in what is now Exchange place. No man knows their present sepulture.

The political turmoils of the period did not retard the growth of New York, and the opening of the 18th century found the town's population increased to 5,000 souls,—Dutch and English nearly equal in numbers; a few French, Swedes and Jews, and about 800 negroes, nearly all of whom were slaves. Slave importation into New York began some time prior to 1628, and reached a climax about 1746, when a census of the town showed 2,400 slaves in a total of less than 12,000 population. Thereafter each year marked a lessening demand for slaves, though they continued to be bought and sold during the entire colonial period. One reason for the decline of slave-holding and slave-buying in New York was the dread of a servile insurrection, dread which led uprisings among the blacks to be punished with unsparing hand. When, in 1712, a party of negroes, forming a wild plot to slay all the whites, met at night in an orchard near Maiden Lane, and killed and wounded a dozen men before being put to flight, 21 of those captured were shot, hung or burned at the stake. Reprisals even more sweeping attended the "Great Negro Plot" of 1741, a panic compounded of fear, rage and suspicion, which has been likened to the witchcraft delusion at Salem village in 1692. This panic had its origin in a series of fires which in March 1741 alarmed the town, and fixed in the minds of many citizens the belief that they were the work of disaffected slaves.

A short time before the indentured servant girl of a low tavern-keeper on the North River had been arrested, together with her master and mistress and two negroes, for complicity in a robbery. When a proclamation appeared offering a reward with a full pardon to any conspirator who would tell what he knew about a plot for burning the town, she saw in it a chance to regain her freedom, and "confessed" that her master and mistress, along with sundry blacks and semi-criminal white, had matured such a plot as the first step in a projected uprising. It has ever since been doubted whether this plot was anything more than a figment of the imagination of a depraved and abandoned girl, but at the moment the creature's charges produced a reign of terror, and scores were jailed and put to death on little save her unsupported statements. Fourteen negroes were burned at the stake, 18 were hanged and 71 transported, while of the 20 whites thrown into prison four were condemned and put to death. Glutted with victims, the panic finally subsided in September 1741, leaving behind it one of the darkest pages in the history of the city. It would be unjust, however, to judge this affair by the standards of a later time. Fear and terror, fed by fraud, appear to have promoted

some awful mistakes, but those who committed them lived and acted under the hair-hung sword. The panic of 1741, moreover, was followed by a wholesome revulsion of popular feeling in favor of the negroes. They were admitted to the franchise within 10 years, and in 1758 the abolition of slavery in New York was practically accomplished by an act which declared that from that time forth all children born of slave parents should be free.

During the first part of the 18th century ocean industries were what mainly contributed to New York's growth and wealth. Kalm, the Swedish traveler, records that 211 vessels entered and 222 vessels cleared from this port in 1730, and the town's river, coast and sea trade grew steadily until the opening of the Revolution when about one-tenth of all the foreign commerce of the colonies were centred at New York. But with the arrival of the British army of occupation, 15 Sept. 1776, a seven years' blight settled over the town. During this period it lost more than half of its population and all of its commerce, and was twice visited by destructive fires. These laid a full fourth part of the town in ashes, nor was any attempt made to repair the devastation until after the British evacuation, 25 Nov. 1783. The war ended, however, the men of New York faced the future with stout hearts. "The town is ruined by the war, but its future greatness is unquestioned," wrote one of them; and in this hopeful spirit was begun the work of building anew—a work pushed with such resolute purpose that within eight years from the town's evacuation its population trebled and its commerce regained and passed its former limit. During this period also it was for a year and a half the capital of the Federal government, and in the Federal Hall in Wall street, on 30 April 1789, Washington was inaugurated first President of the United States.

New York ceased to be the Federal capital in August 1790, but this did not retard its growth, and in 1807, by which time it had reached a population of 60,000, robust faith in its future prompted the appointment of a commission to plot the city south of 155th street substantially as it exists to-day. The commissioners, however, had hardly begun their task, duly completed in 1811, when New York was made to suffer from the chain of events which led to and attended the second war with England. The act of embargo passed by Congress, in September 1807, dealt what seemed at the moment a mortal blow to the prosperity of the town; and John Lambert, the English traveler, writes that in April of the following year he found 500 vessels in its harbor lying up useless and rotting for want of employment, while the losses of the next six years bore more heavily upon New York than any other city. But with the conclusion of a treaty of peace in December 1814 the town's commerce revived on the instant, and the annual revenues of the port, which had fallen to but little more than \$500,000, shot up in 1815 to \$14,000,000.

The end of another two years brought the practical inception of an enterprise to which the modern city is largely indebted for its commercial supremacy,—the cutting of a waterway from the Hudson River to the Great Lakes. The Erie Canal, begun on 4 July 1817, and completed on 26 Oct. 1825, made New York

the gateway to the commerce of half a continent; and so profoundly did this union of the inland and the outland seas affect its growth that the year 1835 found it a city of 200,000 souls. A fire in December 1835, which caused a money loss of upward of \$20,000,000, and the financial panic of 1837, were temporary checks to this growth, but only temporary ones. Gas was introduced into the city in 1825; the first street railway was set afoot in 1831, and in 1851, with the completion of the first trunk line to the Great Lakes, was inaugurated the railway service which has long made New York the seaboard terminus of all east and west lines. This was the Erie, begun in 1836, and extending from Piermont on the Hudson to Dunkirk on Lake Erie. Two years later the second trunk line connecting New York and the West, the New York Central and Hudson River Railroad, was established by the consolidation of a number of shorter lines. Several railroads had been built meanwhile in New Jersey, connecting New York with Philadelphia and other points. These in the process of time became one corporation, as the United Railroads of New Jersey, only to be in turn absorbed by the Pennsylvania Railroad, which after 1854 connected Philadelphia with Pittsburgh, thereby not only perfecting New York's connection with the Middle and Southern States, but also sending from the heart of commerce an artery of traffic into the Middle Western States. The building of these and other lines called, however, for the investment of large sums of money, from which quick returns were expected, and this bred a spirit of speculation whose blighting influence spared no part of the nation. The banks of New York suspended payment from October until December, trade and industry came to a standstill, and there were 5,000 failures, with liabilities exceeding \$300,000,000. But confidence returned with the spring, and with it a resumption of railway construction, which, though temporarily retarded by the Civil War, has ever since tended in growing measure to strengthen New York's hold upon the business of the interior of the country. To-day 10 trunk lines terminate in New York, which is also the objective point of a major portion of the traffic of all the railroads running east and west.

New York's devotion to the Union during the Civil War found expression in many ways. A sixth of its able-bodied male citizens were in the field before the close of the first year of the struggle, while from the first the women of the city busied themselves with efforts to care for the soldiers in camp and hospital and for their widows and orphans. They led in the founding of the Sanitary and Christian commissions, and a single fair held in behalf of the former yielded more than \$1,000,000. A kindred organization ministered to the necessities of refugees from the South, and a Soldiers' Rest was established on the site of Madison Square Garden, where soldiers could find a temporary home while on their way to and from the front. But in no form did New York's devotion to the Union find more sufficing expression than in the labors of the Union League Club, which, founded in the closing days of 1862 on the basis of "absolute and unqualified loyalty to the government, and unwavering support of its effort for the suppression of the

rebellion," counted among its members every loyal citizen of note in the town; \$210,000,000 were subscribed by the bankers and capitalists of Manhattan to the loans made by the government between 1861 and 1865, and the major portion of this sum was furnished or secured by members of the Union League Club. There was but one blot on New York's story of splendid loyalty. Proof of the existence of a turbulent element in the population had been furnished in 1849 when some thousands of rioters, taking into their own hands a quarrel between Edwin Forrest and the English actor, William Charles Macready, sought to drive the latter from the stage of the Astor Place Opera House, but were held in check by the police, fired into by the militia and finally dispersed; and the same lawless spirit found expression in an outbreak yet more ferocious in July 1863. Congress had passed a draft law that unwisely exempted from its operation all who should pay into the Federal treasury the sum of \$300, and the discontent thus produced was systematically fomented in New York City by pot-house politicians, who in bar-rooms and on street corners declared the draft unconstitutional, and that it bore with peculiar oppressiveness on the poor man. Many vowed resistance, and, borrowing courage from the fact that the city, to beat back Lee's invasion of Pennsylvania, had been denuded of all but 300 troops, made plans to attack the drafting officers. No trouble occurred on the first day of the draft, 11 July, but on the third, 13 July, an organized mob attacked and wrecked the office of the provost-marshal at the corner of Third avenue and 46th street. Then the rioters, inspired by animosity toward the negro race, made a raid on a colored orphan asylum in Fifth avenue, between 43d and 44th streets; and though a handful of policemen aided the nurses in getting the children through a rear door to a place of safety, the building was burned to the ground. After this the mob attacked another enrolling office at 1190 Broadway, near 28th street, with the resultant firing and pillage of most of the shops in the neighborhood. A cry now went up to kill the police, and soon 5,000 rioters, so rapidly had the mob swelled in numbers, were marching down Broadway, bent upon the destruction of police headquarters in Mulberry street. Thomas C. Acton, president of the police board, informed of the rioters' purpose, detailed Sergeant Daniel Carpenter with 200 men to lie in wait for them. Carpenter marched his squad into Bleeker street and so to Broadway, at the same time sending detachments up the nearest parallel street east and west to strike the flanks of the oncoming mob. "Hit for their heads, men," were his orders. "Hit quick and hard, and take no prisoners." The fight that followed came soon to an end, and Broadway was cleared of rioters, save those that lay on the pavement with broken skulls. Routed at one point, however, the mob soon rallied at another, and a few hours later, under cover of darkness, a desperate attempt was made to sack and burn the office of the *Tribune* in Park row. Here again the police did heroic service, and a charge led by Inspector George W. Dilks at the head of 110 men drove the rioters from the field with heavy loss in killed and wounded. Riotous feints meantime had been made upon the Seventh avenue and Centre street arsenals and

upon the armory at the corner of Second avenue and 21st street; the house of George Opdyke, mayor of the city, invaded and some of his furniture destroyed, and an attack made against that of Henry J. Raymond, editor of the *Times*, which had strongly supported the draft. It was clear at the close of Monday that the police force of the city was too small to cope with the lawless spirit. The mayor accordingly called on the State and Federal authorities for aid, and all of the New York regiments at the front were ordered to repair to the city. While this order was in process of execution the mob continued its work of firing and looting houses and of maltreating and murdering unoffending negroes; but on the evening of Wednesday the returning regiments began to arrive in the city. With their coming, bayonets and bullets were substituted for policemen's clubs, and the rioters were attacked at every point with a resolute desire to do them harm. This wholesome policy, with a temporary suspension of the draft, quelled the rioting, and on Friday 17 July the mayor was able to announce the complete restoration of order. Two million dollars' worth of property had been destroyed and over 1,200 rioters slain.

New York during the last 50 years has witnessed the assembling of but one mob which the police could not handle without the assistance of the military. That was in July 1871, when the Orange lodges of the city undertook to parade on the anniversary of the battle of the Boyne. Announcement of their purpose evoked threats of violence from the Catholic Irish and fearing trouble, the governor of the State ordered five regiments of the National Guard to escort and protect the procession. Policemen were also detailed to surround and guard it. The point of departure was the corner of Eighth avenue and 29th street and at the appointed hour in the afternoon of 12 July the paraders began their line of march,—a detail of patrolmen in front, then a regiment and next the Orangemen, with a moving wall around them and two other regiments bringing up the rear. Before they had moved two blocks a volley of sticks and stones from sidewalks, house-tops and windows rained upon Orangemen, police and soldiery, many of whom were injured. Angered at this treatment, the members of one of the rear regiments, not waiting for orders, fired, some into the crowd and others at house-tops and windows. There was only one discharge, but 54 persons were slain. After this one deadly volley, police clubs and bayonets held some of the rioters at bay, while the greater number turned and ran as the reserve patrolmen along the line hastened to the scene. The remainder of the march passed without incident.

The political history of New York during the first half of the last century was a varied and turbulent one, but with a steady trend toward making the government democratic in all its branches. Until 1834, the mayor, as has been noted elsewhere, was chosen by the State council of appointment or by the common council of the city, which method of selection brought to the office such men as Edward Livingston, Dewitt Clinton and Philip Hone. After 1834, however, the mayor was elected by the citizens, to whom in the meantime had been granted an unrestricted suffrage. A dozen years later the judiciary was also made elective and thence-

forth most local officers were chosen in the same manner. During this period the Democratic party was the one most often in power, The Federalists, or their successors, the Whigs and Republicans now and then gained the upper hand; but in the long run the Democrats, under the leadership of Tammany Hall, a secret organization whose social and benevolent aims had been early put aside for political ones, always recovered their hold on the reins. The first mayor chosen by popular suffrage was a Democrat and so were most of his successors prior to the Civil War. A Republican in 1862 succeeded to the office, but Tammany Hall soon regained control of the municipal government, and for several years political corruption ran riot in the city. Tammany Hall's master spirit at that period was William M. Tweed (q.v.), an able, but coarse and unscrupulous man, who following 1863 organized the politicians of his own party and a number of the local Republican leaders of the baser sort into a gigantic conspiracy to plunder the city. The Tweed Ring, as it was called, attained its greatest power in 1869, when it was master of every department, not only of the city, but also of the State government. Its greatest scheme of robbery was the building of a new courthouse in City Hall Park. Work on this structure was begun under a stipulation that the cost should not exceed \$250,000, but before 1871 \$8,000,000 were expended on it, more than \$1,000,000 of this sum being traced to Tweed's pocket. The end came in 1871, when the *Times* exposed the operations of the ring. Then an aroused public sentiment compassed its defeat at the polls and this was followed by the prosecution and imprisonment of the chief offenders, Tweed himself dying in a felon's cell.

The material prosperity of the city has increased steadily in the last 50 years. A chief factor in the making of the New York of to-day was the construction of the elevated railway system, completed in 1880 through the efforts of Cyrus W. Field. This brought all parts of the island within easy distance of each other and the unbroken lines of city blocks which quickly followed in its wake wrought a complete transformation in the region in and about Harlem, formerly an isolated suburb reached only by horse-car or steamboat, but now as near the heart of trade as 14th or 42d street was in earlier years.

The territorial expansion of New York has the while more than kept pace with its material development. By an act of the legislature passed in 1873, the corporate limits were carried across the Harlem and a part of Westchester County, amounting to 13,000 acres, erected in city wards. A dozen years later a movement was set on foot to include in one municipality Manhattan Island, Brooklyn, part of Queens County, Staten Island or Richmond County and yet another portion of Westchester County; and in 1890 a commission of 11 members, headed by Andrew H. Green, was appointed to inquire into and report upon the expediency of the project. The labor of the commission took shape in a bill passed by the legislature in 1894, which provided for the submission of the question to a vote of the people of the cities, towns and villages included in the proposed consolida-

tion. The people gave their vote in November of the same year and only the residents of Mount Vernon and the town of Westchester failed to record their approval. Meanwhile, by act of the legislature, West Chester, East Chester, Pelham and Wakefield (or South Mount Vernon), were in June 1895 annexed to New York City, whereby another 20,000 acres were brought within the corporate limits and Westchester township's vote against consolidation rendered ineffective. This carried the city line to the limit in Westchester County recommended by Commissioner Green and his associates and in January 1896 a bill was passed by the legislature which made Kings County, a portion of Queens and all of Richmond integral parts of Greater New York. The same year a commission of nine members was appointed by the governor to frame a charter for the new municipality and report the same to the legislature; and its labors had issue in a bill which on 5 May 1897 received the signature of the governor. This measure, which took effect 1 Jan. 1898, divided the city into five boroughs—Manhattan, the Bronx, Brooklyn, Queens and Richmond,—embracing an area of a little less than 327 square miles, and counting a population in 1920 with an official count of 5,620,048. Thus, fulfilling its destiny, the village of 250 years ago has become the first city in the world. For, from the co-ordination of Greater New York in 1898 and the opening of the 20th century, no other centre of population has made the rapid strides in civic development, outlined in this article in the description of the vast and costly enterprises of intercommunicating river bridges, tunnels, railways, elevated and street railroads, the efficiency engineering of the harbor architects (see NEW YORK, HARBOR OF), the imposing new public and business buildings, the beautifying and extension of parks and parkways, and the varied municipal improvements and service which culminated 12 Oct. 1917 with the opening of the new Catskill aqueduct for the gigantic and unparalleled water-supply system of the metropolis.

NEW YORK, Harbor of. As already stated under New York City (q.v.), the necessities of the European War so greatly increased the commerce of this, the most important harbor on the Atlantic seaboard, that its accommodations and trade-handling facilities were overstrained. Serving as it does for the outlet of the enormous bulk of local manufactures, industries, trade and the greater portion of the exports and imports of, and passing through, the States of New York and New Jersey, the development of the port had long been recognized as the concern of all of both States. The legislatures and governors of New York and New Jersey by the creation of the "New York, New Jersey Port and Harbor Development Commission" in 1917 made effective a joint study of the Port of New York and its requirements. The old method of development with each of some 50 municipalities striving to solve the problems of the port in its own way or utterly disregarding the fact that it had any place or part in solving the problems of the port was failing utterly. With a converging network of trunk-line railroads, the communities had grown by leaps and bounds, and the Port of New York had long handled substantially half the foreign commerce of the country. But the trade of these communities, coming faster, almost, than it could be assimilated was accommodated in accordance with immediate needs, without any general direction. Haphazard facilities and methods had become institutions, as had makeshifts built around them to meet new contingencies. The result was patchwork. Obviously this prevented the best use being made of the natural advantages of the port. At the same time the port as a whole had long suffered the handicap of a differential freight rate in favor of other ports. Latterly, too, other ports had launched a campaign to get more of New York's business. The combination of circumstances had been effective, and New York's commerce had begun to slip away. While this slipping away was slow, there were unmistakable indications that the campaign of the other ports had begun.

The New York, New Jersey Port and Harbor Development Commission, created to study the needs of the port as a whole, was deeply impressed with its responsibility—that of devising a plan to meet the situation and to provide liberally for future trade. It assembled a large amount of data. The task of determining the volume, method of handling and cost thereof of all traffic coming to, originating in or passing through the port was the first phase of the investigation. To supervise and direct the execution of the final plan, the Commission prepared and urged upon the two legislatures early in 1918 the adoption of a supplementary and amendatory compact between the two States creating a permanent "Port of New York District" and "Port of New York Authority."

New York as a Port.— Succinctly summarized for comparative purposes it may be stated that New York is by far the greatest railroad, commercial and industrial center on the Atlantic seaboard. The population of the metropolitan district of New York is four times that of Philadelphia. The port has the finest harbor on the Atlantic Coast, with 780 miles of waterfront.

Three times as many railroad trunk lines come to New York as come to any other city on the Atlantic tidewater. More manufacturing industries are located in the New York district than in the combined cities of Philadelphia, Chicago, Cleveland and Saint Louis, and the value of the products of the New York industries is nearly as great as the combined value of the products of those of the other four cities. Approximately half of all the foreign commerce of the United States passes through the Port of New York. This is one side of the picture, and it might seem that New York's position is unassailable—that as much business as the port desires and can handle is bound to gravitate to it.

There is another side. New York suffers a severe handicap from the differential in railroad freight rates, whereby shippers to or through the Port of New York pay more on shipments than to or through such cities as Philadelphia and Baltimore. A determined campaign is being made to divert traffic from New York, mainly on the grounds of alleged congestion and high terminal costs at New York. The effects of these things are already visible. The tonnage of New York's foreign commerce, mounting steadily from 1911, reached a peak in the year ended 30 June 1914 and has since fallen steadily. The 1918 figures are 26 per cent below those for 1914 and lower than those for 1911 or any succeeding year.

New York's percentage of the total foreign commerce of the United States fell from 52.67 per cent in 1916 to 44.68 per cent in 1917 and 42.36 per cent in 1918, the latter percentage being lower than in any year since 1911 inclusive. Fewer loaded freight cars came to New York in 1918 than in any of the four preceding years. Despite the abnormal railroad traffic in 1918 in the country at large figures compiled by the Commission's statisticians for four of the principal New Jersey trunk lines show that in the first 10 months of 1918 they received 7 per cent fewer loaded cars than in the same months of the slack year 1914 and 20 per cent fewer than in those months in the heavy year 1916.

Far more important than the past is the future. Our country is building a great merchant fleet. The opportunity of the country is here, for the nation to reach out and get its share of the world's trade. It must do so. Other ports are assuming that it will do so, and are preparing to expand their facilities to handle the increased traffic. With five times the traffic of any other Atlantic port, New York's preparations must be vastly more elaborate, in the face of vastly greater complications arising from New York's very size and rapidity of growth. Evidently the time has passed when the needs of the Port of New York can be settled by the individual communities in the two States that constitute the Port—even by the great community of New York City. The legislatures of

NEW YORK CITY

"Liberty Enlightening the World," New York Harbor

New York and New Jersey recognized this in creating this Commission.

The ultimate aim of the Commission, therefore, is to establish a general plan of Port operation and development that will serve as a guide for 50 years; a plan flexible to meet future conditions, but fixed as to general principles; a plan supported by detailed estimates of costs and proof of its economic soundness, and accompanied by a tentative program which will meet the most urgent needs first.

Review of 1918 Report.—Facts as to the organization of the Commission are set forth in the preliminary joint report, dated 26 Jan. 1918, and transmitted to the legislatures of New York and New Jersey 18 Feb. 1918. This report recites how the Commissions of three members each, appointed in 1917 by the governors of New York and New Jersey respectively, organized a joint commission, the chairman being a member of the New York Commission and the vice-chairman a member of the New Jersey Commission—the purpose of the investigation, as set forth by the acts of the two legislatures, being to make an “investigation of the Port conditions at the Port of New York and to submit a comprehensive report recommending the proper policy that shall be pursued for the best interests of the entire Port of New York, and the legislation, State and Federal, that will be necessary to make such recommendations effective.”

The report of 1917 relates how the Joint Commission held meetings and conferences in 1917 with members of the Public Service Commission of New York, the Port and Terminal Facilities Committee of the Board of Estimate and Apportionment and the Commissioner of Docks of New York City, the New Jersey Board of Commerce and Navigation, the New York State Barge Canal Board, the presidents of the trunk-line railroads and various representatives of shipping, lighterage and warehouse business, together with engineering and legal experts of this and other ports.

It tells of inspections of the harbor, of studies of the West Side railroad terminal problem in Manhattan, of the organization at the Commission's suggestion of the War Board for the Port of New York, of other co-operation with the Federal government.

A decision of the Interstate Commerce Commission in the New York Harbor case is referred to, wherein that body states that “historically, geographically and commercially New York and the industrial districts in the northern part of the State of New Jersey constitute a single community,” and commends the creation of this Joint Commission.

The report bounds that single community by Yonkers and New Rochelle on the north, Great Neck and Far Rockaway on the east, Perth Amboy and Sandy Hook on the south, Paterson, Newark and New Brunswick on the west.

Necessity for Port Plan.—Emphasis is laid in the report on the necessity for a definite port policy and plan, with such comparison between the present methods of operation and whatever new methods may be recommended as will afford proof of the economic soundness of the plan and methods recommended.

Many studies and reports on phases of the

problem were made, and the Commission gave them careful consideration. At the same time it pointed out the great diversity of interests involved extending into two States and about 50 municipalities; that no comprehensive plan for the entire metropolitan district has ever been made; and that none of the studies and reports referred to had been supported by evidence, statistics or exact analysis of income, cost of operation and net return on the proposed investment in order to justify their economic soundness.

The Commission stated its purpose to ascertain the volume, route, classification and time of transit of all freight movements in the metropolitan district, together with the cost of handling this freight under normal conditions and with existing facilities. This, it stated would require detail consideration of many factors and a complete survey on the ground for an extended period of the principal lines of rail and water deliveries.

To arrive at the carrying charges of the present capital investment and of the new capital required for additional facilities, the Commission pointed out that an approximate appraisal of the value of existing facilities would be necessary. Such a valuation, it was noted, would have to be available sooner or later if the States should determine that the harbor waterfront was to be publicly owned.

In addition to the preparation of the engineering, operating and financial plans, the report contended that there must be prepared a legal plan for combining the present distributed Federal, State and local powers of administration and construction.

Extent of Investigation.—Finally, the report stated that it would take two years to complete the study, at an estimated cost of \$400,000. The specific recommendations of the Commission were “that the study contemplated in the legislation creating the Commission and outlined in this report be undertaken, and the report prepared, and to that end the two States of New York and New Jersey appropriate \$400,000 in equal payments covering a period of two years.”

The legislatures, recognizing the importance of studying and preparing a plan and policy for the Port of New York, appropriated \$100,000 each to cover half of the program. Both appropriations became available 1 July 1918.

In its pursuit of the investigation the Commission found no reason to revise the estimate of 1917 as to the scope of the work, its probable cost and its probable duration. The problem met in the detail execution of the analysis, the difficulties to be overcome, the inevitable delays, proved about as forecast.

Meanwhile the Commission worked out a definite program for the investigation, built up an engineering organization of about 70 persons, since funds therefor became available in July 1918, and accumulated a mass of important data bearing upon the present operating conditions at the Port.

Engineering Investigation.—On 30 April 1918, in the absence of Maj.-Gen. George W. Goethals, chief consulting engineer of the commission, the consulting engineer was placed in charge of the engineering work. About 1 June 1918, the Commission rented the 11th floor of

the building at 12-16 John street, New York, as its working engineer office. The engineering investigation resolved itself into three phases: (1) Study of existing conditions. (2) Analysis of the handling of commerce under existing conditions. (3) Planning of new methods and facilities.

Phases 1 and 2 were worked out together. Investigation of existing conditions divides the problem into four major headings—railroads, steamship, lighterage and trucking. In addition there are numerous incidental elements in the problem, some of them, such as the matter of markets and food distribution, being of the highest importance.

Organization of Work.—Originally the Commission intended to employ outside engineering organizations to conduct the investigations, so as to obtain as nearly as possible a simultaneous picture of all the operations of the port. But it was perceived that this would require a large number of men and entail great difficulty in instructing them. To get the railroad picture alone, for example, would have taken about 1,000 men. Hence the consulting engineer recommended that he be authorized to organize a force to do this work himself and his recommendation was accepted.

An experienced railroad man was obtained on leave of absence for the period of the investigation, and was put in charge of the main investigating force, with the title of railroad engineer. A force of 24 men was assembled quickly and divided into three squads of eight men each. On 23 July 1918 they began taking 24-hour or 12-hour observations of the railroad operations at all yards and pier stations. This force, which was subsequently increased, completed its railroad observations early in 1918. It was then divided up, the two sections starting the steamship and the trucking investigation simultaneously. An advantage of the continuing force was that it became increasingly familiar with the character of information needed and much time that would have been required for instructing four individual organizations was saved.

Specialists in their line meanwhile were employed for the incidental studies. For assembling auxiliary data, interpreting the information collected and preparing this and other reports a staff of accountants and statisticians assembled and developed the beginning of a drafting department to work out a general plan for the Port.

Four Major Investigations.—*Railroads.*—Twelve trunk line railroads were involved in the railroad investigation: the Central of New Jersey, the Lehigh Valley, the Erie, the Delaware, Lackawanna and Western; the Pennsylvania, the West Shore and the New York, Ontario and Western (the latter having traffic rights on the West Shore) on the New Jersey shore of the Hudson River, the Baltimore and Ohio on Staten Island, the New York Central on the west side of Manhattan; the New York New Haven and Hartford in the Bronx, the Long Island in Long Island City, and the Philadelphia and Reading, which has a coal terminal at Port Reading, north of Perth Amboy.

The railroad investigation involved the analysis of the break-up and waterfront yards of each of these railroads, together with a study

of the local terminals and piers for both general merchandise and special uses along most of the waterfronts of the North, East and Harlem Rivers; New York, Newark, Raritan and Jamaica Bays and the Long Island Sound.

Steamships.—The steamship investigation entailed the examination of steamship operations of all sorts along a great part of these waterfronts.

Lighterage.—The lighterage investigation involved the study of the local-waterways transportation system, more highly developed in New York Harbor than anywhere else in the world, between ship, car and local consumer or producer.

Trucking.—Trucking is employed mainly as the final or initial stage of transportation, as the case may be, for the local consumer or producer. But it is utilized also to a considerable extent in trans-shipment of goods through the port. A visit to the district of lower Manhattan shows that here perhaps is the soundest basis for the charges of congestion made against the Port of New York, and suggests the great importance of the trucking investigation.

Twenty-three Incidental Investigations.—One of the most important of the incidental investigations, and one deeply involved in the trucking investigation, was that of public markets and food distribution. Fourteen hundred carloads each day, it is estimated, are required to feed New York and vicinity. The present system of distribution ties up a large section of lower Manhattan's most valuable waterfront, besides filling the North River with car floats and the streets of lower New York with trucks.

Closely connected with this problem is one of the most acute problems of the port—that of the New York Central Railroad's freight line on the West Side of Manhattan. A third matter treated at some length is that of an exterior belt-line railroad in New Jersey.

Criticism has often been made of the mechanical equipment of New York harbor as compared with that of some of the European cities, and New York's equipment has been as often defended on the ground that European methods are not feasible here. Thorough analysis of New York's system is necessary and closely allied to this question are the special problems involved in the handling of building materials and grain. The operation of private terminals and of general merchandise warehouses also has an important bearing on the situation, as do the provisions, or lack of them, for the utilization by the port of the New York Barge Canal. The disposal of municipal wastes, in view of the fact that the waters of the metropolitan district are near the danger point from sewage and other pollution, must be given thorough consideration in the development of any plan which will tend to impede the disposal of such wastes, or bring population and industries that will add further pollution. All these and numerous other elements of the problem were studied by the engineers of the commission.

Erie Traffic Count.—The first railroad field investigation made was that of the Erie Railroad. As the Erie is typical of the New Jersey trunk lines, a brief outline of the investigation will be of interest here.

The Erie is a double-track low-grade line between New York and Chicago, with branches to Buffalo, Dunkirk and Cleveland on Lake Erie, to the anthracite coal field of Pennsylvania and to the bituminous fields of Pennsylvania and Ohio. It taps the Great Lakes ore traffic at Cleveland and runs through the heart of the steel district at Youngstown, Ohio. It has various other branches. In all it operates 2,400 miles of road.

Its terminal units at the Port of New York consist of a break-up and main classification yard at Croxton, on the New Jersey Meadows; an auxiliary classification yard at Little Ferry; waterfront yards with pier and other facilities at Jersey City, Weehawken and Undercliff; piers on the Manhattan waterfront at Duane and Houston streets, North River, and at Coenties Slip, East River; an interior freight station between West 28th and 29th streets and 11th and 12th avenues; a station in the Wallabout Market district, Brooklyn; traffic rights at the Harlem terminal of the Delaware, Lackawanna and Western Railroad at 135th street and Harlem River, and traffic rights in common with other railroads at other private and public terminals in the harbor.

As a preliminary the facilities and their functions at each of these terminal units were examined and recorded. It was noted, for example, that Croxton yard has a working capacity of 4,708 cars; that nearly all inbound freight comes to it and is classified according to local destination; that in reverse order outbound freight is assembled here and classified according to destination; that facilities exist for reclassifying less than carload freight and consolidating it in other cars according to destination; that there are facilities for icing cars and for repairing crippled cars and trackage for "hold" cars and for interchange with the Delaware, Lackawanna and Western Railroad.

The yard is a gravity yard with a classification "hump" in each direction. The operation of the yard has been studied in detail—the number of tracks and the capacities of each unit, the number of classifications made and the tracks used for each, the system in effect at the transfer platform.

In like manner preliminary scrutiny showed that the Jersey City yard is in effect two yards divided by the passenger-train layout, and each yard serving certain piers and other facilities. The uses, sizes and capacities of each of these facilities were determined. Similar information regarding every one of the Erie's terminal units was obtained.

Most of the traffic counts covered 24-hour periods and the men worked in three shifts of eight men each. At Croxton yard for each shift one inspector was stationed at the westerly end of the yard to count trains, engines and cars entering and leaving; a second was stationed for the same purpose at the easterly end; a third was assigned to the yardmaster's office to copy train lists; a fourth took his post at the inbound hump and a fifth at the outbound hump to keep account of classifications; a sixth and seventh were assigned respectively to the transfer platform and the icing platform, while the eighth, the squad leader, supervised the entire count and gave assistance where needed.

This count disclosed the total number of cars received inbound in a 24-hour period and their destination; the number of cars received from other railroads and their destination; the number of cars forwarded to each of the waterfront terminals and to other railroads; the number of outbound cars received and their origin; the number of outbound cars forwarded and their general destination; the number of cars passed over each hump; the number of cars loaded and a large number of incidental operations.

For the north Jersey City yards one inspector was stationed on the main classification engine, one at the yardmaster's office, one at the float bridges and one at each of the lighterage piers. Fewer cars pass through this yard, hence more detailed data were obtained. The inbound cars, for example, divided into 20 groups according to destination. The contents of cars iced were noted here as at Croxton. The south Jersey City yard was handled in a like manner. A separate eight-hour count was made at the milk platform. The traffic study at Duane street was made on a somewhat different basis from those at the railroad yards, inasmuch as trucking movements as well as car operations were taken into account. The census was an 11-hour operation requiring 24 men divided into two shifts of 12 men each.

This is one of the typical waterfront freight stations, where the cars are brought alongside the piers on car floats and unloaded and reloaded as at the ordinary inland freight station. The system causes a piling up of trucks waiting to load and unload and results in much loss of time to the owners. The traffic count covered not only the number of car-floats and cars received and forwarded, but also the number of trucks arriving and departing and much information about where they came from and where they went.

The foregoing merely outlines the method pursued in the railroad investigation and suggests the magnitude of the work and the mass of valuable information being obtained.

Terminal Costs.—Meanwhile the commission organized an auditing staff to go into the books of the carriers to determine the tonnages handled and the costs. Unit costs were derived for terminal operations on four of the trunk-line railroads. They were determined for 1918 on the basis of the actual 24-hour observations, and for 1914 on the basis of the companies' records, for the month of July 1914. It was felt that while it was desirable to know the latest costs obtainable and the costs of operations actually observed, it was equally desirable to know the costs under the more normal conditions prior to the World War. July 1914 was selected as the most suitable month for determining pre-war costs.

Classification of Tonnages.—A beginning was made toward a classification of all tonnages coming to or going from the Port of New York in a typical pre-war year. As far as possible, the tonnages were classified in three ways—by commodities, by point of origin or destination at the port and by general locality of origin or destination at the other end of the journey. The second classification will obviously show whether the shipment is to, from or through the Port of New York. Knowledge of what comes to and goes from the port,

whence it comes and where it goes, should help greatly in evolving the general plan.

Special Investigations.—The special investigations were grouped under 23 heads as follows: West Side Railroad, Manhattan; markets and food distribution; Exterior Belt Line, New Jersey; mechanical equipment of harbor; banking and commercial operations; tariff, charges, rates; stevedoring, longshoremen, pilotage; disposal of municipal waste; handling of building material; conditions at New York piers; Barge Canal terminals; canals and waterways; private terminals; warehouses; ferries; handling of fuel; handling of ice; handling of grain; express business; electric-power supply; water supply; trucking; channels and dredging.

Some of these special investigations involve much more work than others, and the studies are in various stages of completion. Three of the most important of them—those covering the West Side Railroad, Manhattan, the system of markets and food distribution and the exterior belt line in New Jersey—are as previously stated discussed at some length elsewhere in this report. Some of the others may be briefly outlined here.

Ice.—The handling of ice is somewhat allied to the food problem. An investigator for the commission has made a canvass of all of the ice-houses along the Hudson River from which New York gets most of its natural ice, of the artificial ice plants which contribute to the city's supply and of the New Jersey ice sources. Data are being assembled as to the amounts of ice harvested and manufactured, the methods of distribution and the costs.

Grain.—Grain is one of the commodities handled in large quantities at the Port—a commodity that requires special facilities both for local distribution and for exporting. The handling of grain has been studied at considerable length in the light of existing facilities, the facilities at competing ports and the general volume and trend of the grain movement.

Building Materials.—The delivery of building materials—sand, gravel, stone, lime, cement, brick, steel and lumber—in New York is hampered by a shortage of open wharves, especially on the West Side of Manhattan below 47th street and the East Side below 23d street. There has been no improvement in the methods of handling these materials in 30 years, and meanwhile the number of open piers available has been cut down from year to year. This has resulted in longer hauls and higher costs of delivery. An examination of the waterfront has been made to determine just what piers and bulkheads are being used now for the various materials and what others could be advantageously put to this use.

Trucking.—While trucking constitutes one of the primary subjects for investigation, certain phases of the subject, especially the question of trucking delays and costs, were given early attention and listed as a special investigation, because of the movement made last year to bring about store-door delivery of freight consigned to railroad pier stations in Manhattan.

The so-called Harlan plan for store-door delivery, put forth last summer by Hon. James S. Harlan, member of the interstate commerce commission, followed several other plans pro-

posed to remedy the existing evils of a multiplication of underloaded trucks on the piers and the congestion incident to the necessity of giving consignees notice of arrival of their goods. The commission's investigators looked up and recorded all of the plans and their evolution into the Harlan plan.

Three of the investigators also devoted several weeks to traffic counts at certain typical points, to time studies of individual trucks and routes and to interviews with truckmen and companies using trucks. One study of special interest was the operations for six days of a two-horse truck serving a certain drygoods store. Account was taken of loads carried, time of loading and unloading, time of transit and idle time. The result showed that the truck carried on the average only 28 per cent of a load, and that it made only 36 per cent of the distance possible, so that its efficiency, determined by the product of the two percentages, was only 10 per cent.

The investigators also made an extensive study of the elements in the cost of trucking operations.

Stevedoring.—Stevedoring was studied under two general heads—the equipment available at the port and the form and execution of stevedoring contracts. Under the former head data have been recorded as to the types of machinery utilized and their form of operation; under the latter the question of stevedoring rates and costs and the difficulties of the labor problem.

Barge Canal Terminals.—New York's new Barge Canal was put into operation in 1917, and it is desirable to know whether adequate provision in the way of terminals has been made to enable the Port of New York to make full use of the possibilities of this enlarged waterway. Study has been made both of such construction as has been completed and of plans not yet executed, and later on the commission expects to be able to offer plans for additional terminals.

Canals and Waterways.—Along with the study of the possibilities of the New York Barge Canal an examination was made of other waterways, existing or contemplated, for barges and for ships, which might be a factor in the operations of the port. This examination embraced several existing canals for small boats to the west and southwest of the port; the projected intracoastal ship canal system from Boston to Florida, of which the proposed New Jersey Ship Canal, an enlarged Chesapeake and Delaware Canal and the Cape Code Canal would be the most important to New York; the New Jersey Marginal Canal (New Jersey Inland Waterway) and several projected Long Island canals.

Channels and Dredging.—An investigation was made of the navigable depths of the various harbor waters, the controlling depths of channels, the obstructions to navigation. The dangerous reefs in the East River, the channel projects for Jamaica and Newark bays, the desirability of dredging the Harlem River are among the matters considered in this investigation.

Warehouses.—There are more than 600 freight warehouses and storehouses in New York and New Jersey within the metropolitan

district, exclusive of a large number of houses which handle household goods only and, therefore, are of no interest in this investigation. A questionnaire was sent out to the owners of all of these freight houses and in addition an investigator for the commission visited most of them and obtained supplementary information. Practically all of the questionnaires were filled out and returned.

Electric-Power Supply.—Electricity will undoubtedly be more and more a factor in the operation of the port. A record has been made of every electric-power plant in the district—its location, capacity, ownership, use and other characteristics. The histories and growth of the different companies have been examined and forecasts have been made of the probable supply of and demand for power in the future.

Water Supply.—Analogous to this is the investigation of the water supply of the port. Here again a record was made of locations, capacities, ownership, uses and other details of water-sheds, reservoirs, pumping stations, distribution systems and other elements that go to make up a waterworks system. The water supplies of the cities in New Jersey were covered and similar data collected for the area east of the Hudson.

Disposal of Wastes.—For a long time the navigable waters of the metropolitan district have been heavily burdened with sewage and industrial wastes. Some of this overburden, under present conditions, passes out to sea quickly, while some, in the land-locked North and East rivers, surges back and forth with the tides. Elaborate plans have been promulgated to cope with the situation, and it is obvious that waterway and waterfront changes which might affect the tidal conditions and which certainly would have important bearing on any disposal scheme of the magnitude required here must take into account this whole problem. This would be true if the port were not to continue to grow. The aim of the Commission is to devise ways and means to enhance its growth and so it becomes doubly necessary to provide for the disposal of the wastes of future population and industries. The question of whether harbor pollution should come under the jurisdiction of a joint port authority, if one be created, in the light of the Passaic Valley Sewerage Commission case, is discussed, and irrespective of how this question should be answered, it is obvious that this Commission must co-ordinate its general plan with the sewage-disposal problem. Of hardly less importance are the problems of the disposal of garbage and rubbish. Valuable waterfronts are used for dumps, and many scows are required to handle the port's refuse. The methods in use were, therefore, studied at some length.

Conditions at New York Piers.—Apart from the general steamship investigation, was the question of the uses of New York's piers. Early last November two investigators were assigned to this work, and in about five weeks they covered the railroad piers on the New York side of North River.

These men visited each of these piers and noted its size, equipment and use. They considered methods of operation in effect and recorded practices that interfered with efficiency.

Whether reassignment of piers according to some zoning system is feasible was one of

the objects of the survey. Soundings were, therefore, taken alongside the piers and a general examination was made as to whether they could be put to other uses. This survey was continued along the East River and other waterfrontage of the port.

Other Investigations.—Among the other special investigations, that of banking and commercial operations disclosed the general methods of financing New York's commerce, going into such questions as credits, exchanges and discounts and comparing them as they exist in New York with those prevalent at London and other foreign ports in order to determine what burdens are placed on New York's commerce by reason of financial operations abroad—what customs exist which interfere with New York's commerce.

The private terminal investigation covered such plants as that of the Bush Terminal Company, the New York Dock Company, the Brooklyn Eastern District Terminal Company and the Jay Street Terminal Company. The fuel investigation covered the handling of fuel both for local delivery and for the bunkering of ships. The investigation of tariffs and charges aims to determine the truth or falsity of the claim often heard of undue charges for the use of harbor facilities.

Thus are outlined some of the special investigations made. Some of the subjects had been given little consideration in previous studies of the port.

Tunnels and Other Projects.—**Vehicular Tunnel Under Hudson River.**—A project much in the public eye at present is the proposed vehicular tunnel under the Hudson River. The recent marine workers' strikes have brought forcibly to public attention the possibility of a complete cutting off of vehicular traffic between New York and New Jersey, even though in both of these strikes the Lackawanna ferries remained in operation, and though other ferry service was resumed after three or four days.

The need for a vehicular connection between the two States, and the question of whether a bridge or a tunnel should be built, have been under study for a number of years by a special joint commission created for the purpose. A vehicular tunnel will assuredly aid in the co-ordination of the port, and any plan evolved should be able to utilize the tunnel to good advantage.

Staten Island Tunnel.—Another fact the first of the recent strikes brought out is the ease with which Staten Island can be isolated. Its only rail connection with the mainland is the Baltimore and Ohio freight line to Saint George. There are six ferries, from Manhattan, South Brooklyn, Bayonne, Elizabethport, Carteret and Perth Amboy, respectively—only the first two, it will be perceived, giving direct connection to New York. The Manhattan ferry is the main dependence of the island, and during the first day of the strike its boats did not run. The consequent inability of thousands to reach Manhattan to fulfill their business engagements has revived the demand of the residents of the island for a tunnel connection. There are three main possibilities for such a tunnel connection. The first is the direct tunnel under the Upper Bay to Manhattan. This is the most direct but also the most expensive. The second is a tunnel under the

Narrows to Brooklyn, connecting with the transit systems in that borough. This would require a much shorter tunnel. The third involves a still shorter tunnel, under the Kill van Kull to Bayonne.

Brooklyn Marginal Railway.—For years there has been agitation for a marginal railway in Brooklyn. Special legislation has been passed to permit the construction and operation of such a railway from the New York Dock Company's terminal near Brooklyn Bridge to the Bush Terminal in South Brooklyn. Various obstacles, however, notably the unwillingness of the trunk-line railroads while under private operation to co-operate in the undertaking, have blocked it. Since the United States government took over the railroads the Railroad Administration, through its budget committee, has been studying the matter further. A plan has been submitted for a line from the Brooklyn Navy Yard up the East River and Newtown Creek to the Bushwick terminal of the Long Island Railroad.

Co-operation with Other Agencies.—Throughout the investigation the Commission sought to co-operate with and obtain the co-operation of other agencies. The Commission invited and had before it at many of its meetings the presidents of the trunk-line railroads, the heads of shipping interests, the heads of terminal companies and various other interests using the harbor. After the government had taken over the operation of the railroads and other industries the Commission was in close touch with the Railroad Administration, the Port and Harbor Facilities Commission of the United States Shipping Board and the Fuel Administration. The Commission early addressed a communication to the Secretary of War, the Secretary of the Navy, the Director General of Railroads and the chairman of the United States Shipping Board, requesting that before any construction work was done in the port the plans be submitted to the Commission for an expression of opinion as to whether they would interfere with the carrying out of a comprehensive port plan. The authorities in Washington readily agreed to this and there was scarcely a week when some project was not referred to the Commission by the authorities in Washington for an expression of opinion.

As a point of contact with the Commission the regional director of railroads appointed a committee consisting of the managers of all of the trunk lines entering New York, and the fullest co-operation has been extended in the way of permission to go upon the property of the railroads in the field and in the auditor's offices.

In like manner there was hearty co-operation between the board and the commissioner of docks of New York City. The commissioner readily perceived that the missions of the dock department and the Joint Commission were quite distinct—that of the former being to study and prescribe for the immediate needs of New York City, that of the latter to fit such new construction or changes in the mode of operation as are adopted into the ultimate plan, and offer objection only in case of seeming conflict with the ultimate requirements of the port as a whole. The commissioner, therefore, appeared before this Commission, submitted various plans and in many ways the cordial desire of mutual

service between commissioner and Commission was invaluable.

Compact Between New York and New Jersey for the Creation of a Port Authority.

—The investigation and studies made by the Commission soon convinced the Commission that, whatever physical plan might ultimately be worked out, it was essential that the two States be brought together in an agreement or compact fixing the basis and terms of co-operation, and providing for legal machinery through which this co-operation could be made effective. The Commission, therefore, requested its counsel to make a careful and exhaustive study of all the legal phases of the problem.

Such a study was made and brings together the precedents bearing upon the problem; discusses at length the history of the early commercial relations between New York and New Jersey; the boundary dispute; the treaty of 1834; the purpose and meaning of that treaty; the Federal power over interstate commerce and navigation; the powers of the two States, covering the title to shore-front property both in New Jersey and New York, the regulation of waterfront franchises, the various agencies—corporations, municipalities or other delegated powers—through which the States may act, the legal basis for interstate action and the treaty or compact-making power of the States; also the experiences in international law in dealing with such problems; the methods for the enforcement of an interstate treaty; State limitations upon borrowing capacity thereof, and other phases of the problem. This report is regarded by experts as the first compilation of authorities upon these phases of the problem of port development.

The legal problem is unique. As stated by counsel, "at the threshold we face the fact of a dual political sovereignty. The port lies in two States, each an independent sovereignty in its own land. The legal problem, therefore, can not so easily be stated or solved as it might be for New Orleans, Philadelphia, Boston or Baltimore. Again, traffic between two States across boundary waters is interstate commerce. Neither one State nor the other can wholly regulate the port."

If it is important to overcome the physical barriers that separate the two States it is of even greater importance to overcome the legal barriers. The Commission felt that the implicit obligation of the legislation under which it was created should be reduced to the form of a compact whose terms should be explicit and definite—a compact by which the States should co-operate through a common agency in the development of port facilities. It was convinced that there were no constitutional or legal difficulties in the way of such a compact and that it should supplement the existing compact between New York and New Jersey made in 1834.

Acting under instructions of the Commission, accordingly, counsel for the Commission prepared a tentative draft of such a supplemental compact. A copy of the draft was sent to all members of the Legislatures of both States, to the mayor and other members of the board of estimate and apportionment of New York City, to other municipal officials within the metropolitan district, to civic and commercial bodies and to the press. The first public

consideration of this draft was given at a meeting held at the New York Chamber of Commerce, 19 December, when Governor Whitman and Governor Edge took occasion to pledge their support to the proposed compact between the two States. The main features of the proposition almost at once secured general popular approval. The metropolitan press was almost unanimously for it.

At the request of Governor Edge the State Bar Association of New Jersey appointed a special committee to consider the proposed draft. The committee approved of its legality. Committees of the various bodies endorsing the plan made careful study of the details, and valuable suggestions and criticisms were received by the Commission and its counsel. Public hearings were held at Newark and New York City on 18 and 22 Jan. 1919, respectively.

On 29 January, a conference was held at Albany, when the draft of the compact was presented and discussed, and it was agreed that a legislative bi-State Commission should be appointed, which should co-operate with the Commission in the revision of the compact so that it might be presented in complementary form to the Legislatures of both States.

On 15 February, through the courtesy of the New York Chamber of Commerce, the Commission met at the chamber and considered the proposed compact.

The conference adjourned to 1 March after appointing to revise and redraft the proposed compact a sub-committee consisting of the Attorney-Generals of both States, the majority and minority leaders of both Houses of both States, and the corporation counsels of New York and Jersey City.

The sub-committee met on 21 February and considered all the criticisms and suggestions that had been made, and instructed counsel for the Commission to revise the draft and present it for further consideration to the sub-committee prior to the meeting of 1 March.

At the adjourned meeting of the bi-State Commission held on 1 March at the Chamber of Commerce, Governor Smith, Speaker Sweet and Senator Walters requested an adjournment of the conference until the administrative officials of the City of New York might be given an opportunity to consider the proposed draft and express their views thereon. The conference, accordingly, adjourned subject to the call of the chair as soon as the New York legislative section of the conference was ready to report.

The matter was set down for a public hearing by the Board of Estimate and Apportionment on 26 March.

On 4 April the Board of Estimate and Apportionment adopted a resolution in which the board expressed itself as being "fully impressed with the necessity for co-operation between the two States to develop the Port of New York," and "ready to immediately consider and carefully study any comprehensive plan having that for its object"; but the board believed that the "presentation and adoption of such comprehensive plan should precede the making of the proposed treaty granting such vast power for all time to the Port Authority in the Port District to be created thereby."

The board recommended that the Commission be continued in existence so as to permit it,

as a result of the studies it had already made and was still making, to present such comprehensive physical plan for examination and study, together with a comprehensive statement of the ways and means to carry such plan into effect. It is also stated that "the active and earnest co-operation of New Jersey is invited by the board in any movement tending to improve and develop the Port of New York in all its parts and to the fullest extent, including matters relative to river and harbor pollution, which now constitutes a grave menace to the harbor of New York, and the abatement of the nuisance arising from the poisonous fumes generated in the factories or plants situated on the New Jersey shore opposite Riverside Drive, which nuisance is most injurious to the health and detrimental to the property of the people residing in that locality."

Main Criticisms of Compact.—The main criticisms of the form of the compact developed by the public discussion before the Board of Estimate and Apportionment, with the arguments pro and con, are thus summarized.

Constitution of Port Authority.—It seemed to be the opinion of the members of the Board of Estimate and Apportionment that the New York section of the Port Authority should be made up of the Board of Estimate and Apportionment as a whole, or that at least two of its members should be members of the board. In support of this proposition the argument is that since the interests of New York City are so large and extensive and the consequences to the city's development so direct and immediate, the city should have virtual control of the New York section of the Port Authority. It is argued also that the principle of home rule applies to an agency having so much to do with the future development of the States.

Against the proposition, it is held that the future development of the port will require a continuing body acquiring its knowledge by experience and not subject at any time to being made the football of politics; that such a continuing authority exists at all other important ports; that without it there will be no adequate consideration given to the great problems of the port, and that the history of all administrations in the past shows that the members of the Board of Estimate and Apportionment are too busy with other matters to give time and attention necessary to port problems. It is pointed out, furthermore, that the port is not only a city matter but a State matter; and the State's credit may be required for its development.

The opinion of the Commission has been heretofore that the matter of selecting membership in the Port Authority was properly a subject for legislation and should not be embraced in the treaty. Article IV provides that the New York members are to be chosen by the State of New York and the New Jersey members by the State of New Jersey "in the manner and for the term fixed by the Legislatures of each State."

Veto Power of the Governors.—It is provided that each State reserves the right hereafter to authorize the vetoing by its governor of any action of the Port Authority. It was argued before the Board of Estimate and Apportionment that this would give either governor power to hold up any improvement, no

matter how desirable, and though concurred in by the Port Authority. It is the opinion of the Commission that this section may well receive further consideration on the part of the bi-State Legislative Commission.

Harbor Pollution.—It is provided that until otherwise determined by the Legislatures the term "rule or regulation for the improvement of the conduct of navigation and commerce within the district," shall not include matter relating to harbor or river pollution. It seems to be the opinion of the members of the Board of Estimate and Apportionment that this reservation should not be made. In this connection attention is called to the fact that there is pending in the United States Supreme Court a suit of the State of New York against the State of New Jersey and the Passaic Valley Sewerage Commission to restrain the construction and operation of the trunk-line sewer to be built for the purpose of conducting the discharge of sewage to a point in New York Bay. The original bill in this suit was filed 7 Oct. 1908, and by a recent order of the United States Supreme Court the case was reopened for the purpose of taking additional testimony; and it has been stated both in New York and New Jersey that the inclusion in the proposed compact of matters of harbor pollution might embarrass the United States Supreme Court in the decision of the pending litigation. In 1903 the New York Legislature appointed a commission to investigate certain threatened pollutions of waters in New York Bay. This Commission made its first report on 31 March 1905, and its second report 30 April 1906. In its report of 31 March 1905, it emphasized in the following language the needs of the metropolitan district as a whole and the desirability of Joint State action: "It has been suggested, therefore, that a metropolitan sewerage district should be established, to include all sections in both New York State and New Jersey which now or in future may sewer into the bay and its tributaries. This district, when authorized by joint State and Federal legislation, should be under the direction and control of a permanent interstate commission, with plenary power to control the discharge of all sewers hereafter constructed, as well as the task of evolving a comprehensive plan for ultimately rendering the present chaotic and systemless method of sewage disposal sanitary and suitable for all future requirements.

"There seems to be no possibility of a comprehensive treatment of this great question through the action of various and constantly changing local authorities, acting independently. Manhattan may continue, as at present, to follow no system whatever, simply emptying a new sewer into North or East River at any place where grades permit, even though a recreation pier or public bath may be already established at the same point. Brooklyn may, and probably will, carry its sewage into the sea, and thus ruin the bathing beaches within its limits, and pollute the great oyster beds therein, and Westchester County for 40 miles from the city may contribute a large amount of sewage, while the State of New Jersey, with its constantly increasing population, will add to its present outflow from year to year.

"The necessity also exists for a central authority to not only direct, but also initiate, these

great public works, upon which depend the beauty and healthfulness of the approximately 450 miles of shore within the metropolitan district.

"Immediate action should be commenced to secure such an interstate commission, for the existing conditions must steadily approach the point where the public will demand relief.

"In this country there is at present but one locality at all analogous to New York in this respect, viz., Boston, where a great metropolitan district empties its sewage into the harbor, but the difference in governing conditions is radical, as but one State is in control, while for New York harbor two great commonwealths would have to join forces.

"England permitted the pollution of the Thames for centuries, but at last was compelled to purify its waters at a cost far exceeding the expense of preventing such contamination had the demands of competent judges been complied with a hundred years ago.

"If New York and New Jersey should now initiate the plan above outlined the mistakes of other great municipalities could be happily avoided."

In support of the policy urged by the Commission it obtained from Attorney-General John Cuneen an opinion upon the question "whether in the event this commission finds it desirable to recommend for future consideration the establishment of a metropolitan sewerage district, covering parts of the two States of New York and New Jersey, the Legislatures of the two States have authority to establish such a district and appoint a commission having adequate powers of administration," the Attorney-General answering the question as follows: "I am of the opinion that the States of New York and New Jersey may, if they see fit, construct a metropolitan sewerage district, covering parts of the territory of the two States, and giving jurisdiction thereover to the courts of one or the other of said two States, as to all matters pertaining to the proper sewerage of said district. Such concurrent acts of the States of New York and New Jersey should, however, in my judgment, be approved and ratified by an act of Congress, for the reasons hereinbefore set forth, namely, that the Federal Government has supreme control over the navigable waters of the Hudson River and New York Bay, and its approval should, therefore, be had to the joint action of the contiguous States."

Notwithstanding the very wise suggestion on the part of the New York Bay Pollution Commission, no attempt has been made since 1906 to bring the States together upon a compact which would cover this important matter and create the central authority recommended by the commission of 1903.

The Port and Harbor Commission was not charged primarily with the duty of considering the matter of harbor pollution, but it has no hesitancy in adopting and agreeing with the conclusion quoted from the report by the New York Bay Pollution Commission. If it were not for the pendency of the litigation in the United States Supreme Court, it would urge the wisdom of now adopting, after 14 years' delay, the recommendations of the New York Bay Pollution Commission.

Veto Power for New York City.—At various

points in the discussion before the Board of Estimate and Apportionment and in the argument made by its corporation counsel, it was urged that the action of the Port Authority in the making of rules and regulations, as well as in the carrying forward of constructive plans, should always be subject to the consent of the Board of Estimate and Apportionment of New York City. Such a provision, in the judgment of the Commission, would tie the hands of the Port Authority and preclude it from going forward with its work.

The Commission realizes that there are many phases of port development in which the assent of the authorities of the City of New York should be obtained, and that this is equally true of other municipalities in other parts of the proposed district. The Commission is of the opinion that this should be worked out in the legislation to accompany the physical plan, and should not form a part of the treaty.

Flexibility in the Comprehensive Plan.—It was urged that the provision in the proposed compact, "that no change in the plan for the comprehensive development of the port after it has been adopted by the Legislatures of the two States shall be made except by and with the approval of the Legislatures of both States," would preclude necessary changes in the physical plan that would develop as time went on. It is only fair to state that the Commission does not aim to present a comprehensive physical plan so inflexible as to preclude any change. Such a plan, when presented, will undoubtedly distinguish between what may be called "main features" or "fixed points" and other features which will be treated as matters of detail, subject to change in accordance with provisions of the legislation accompanying the adoption of the plan.

Reversion of Property to the City.—It was explained to the members of the Board of Estimate and Apportionment that in the case of any improvement made by the Port Authority by contract with the city in which the consent of the city was essential, for the crossing or closing of streets, or in which a franchise grant from the city was essential, the city would doubtless require that the property when paid for should revert to it. Members of the Board of Estimate and Apportionment seemed to think that there should be a definite provision in the treaty to cover such a situation. Since, however, the project could not be consummated without the consent of the city, it seems reasonable to assume that any enlightened administration would make such a provision a condition of the grant or franchise.

The Commission is reluctant to insert in the treaty anything except those features absolutely essential. It would seem to be sound judgment that all matters requiring flexibility should be left to legislation following the treaty rather than be embodied in the treaty itself.

With the exception of certain minor changes that have been suggested, the foregoing present all of the subjects that have been made the basis of public discussion before the Board of Estimate and Apportionment. In the opinion of the Commission they present no insuperable difficulties or obstacles which cannot be overcome in any open-minded conference purposing to effectuate the compact.

Conclusion.—The problems of the port of

New York are more serious than is generally realized, even at the port itself. To the population of the port they are serious, because if anything less than the most efficient system obtainable is in use this fact must be reflected in prices; and because if any other port can offer a more efficient system it is likely to draw trade from New York. To all New York State and all New Jersey they are serious, because New York is the gateway to and from the interior. If there is congestion at the gateway the interior suffers. The interior trader bears his share of the extra terminal costs. He perhaps suffers a still greater loss through delays, which make his shipments undependable and put him at a disadvantage with his competitor who escapes these delays.

To the nation itself the problems are equally serious. Foreign trade has established New York as its focal point, and at this time, when we have a wonderful opportunity to serve the world and ourselves by expanding our foreign trade, it is of the utmost importance that New York be ready—ready to take half of the increase in trade as she now receives substantially half of the total trade. If large preparations are being made or planned at other ports, they must be vastly larger at New York.

The Commission, bearing all of the foregoing in mind, believes that the greatest benefit to the communities of the Port of New York, to the States of New York and New Jersey at large and to the entire country will come from a scientific development of the whole port, and is earnestly seeking to evolve a plan for such a development. Its findings to date can be summarized as follows:

A co-ordinated plan that will be a guide for 50 years can be evolved only after the picture and analysis of present conditions has been completed.

Unquestionably the most important physical problem of the port is that of providing for a better and more economical movement of inbound and outbound freight over the trunk lines now terminating on the New Jersey and Staten Island waterfront. Its solution can be found only when the details of the present conditions are known. Three problems that are in a way part of this general problem, but are urgent in themselves, are being given special study. They are the West Side railroad situation in Manhattan; the food distribution system of the port, which is inseparably related to the West Side problem, and the exterior belt line in New Jersey. Another major problem which must await the complete analysis is that of providing adequate steamship terminals properly related to the railroads.

Execution of any plan will require the direction of a permanent authority with broad powers. The Commission has, therefore, urged the adoption of the compact discussed in the preceding section of this report. If this cannot be consummated this year 1919 the Commission confidently hopes joint action will be taken at the next sessions of the Legislatures to create a "Port of New York District" and a "Port of New York Authority."

In order that the commission may complete its work, it recommended that the States of New York and New Jersey each appropriate \$100,000, the second and final installment of the amount determined upon a year ago as neces-

sary to cover the expenses of the investigation. By direction of Governor Edge and Hon. J. Henry Walters, the bi-State conference reconvened at the call of the chairman on 5 April and the conference unanimously adopted the following resolution:

Resolved: That to the end that a compact between the two States may be submitted to the next Legislature of each State, amended in the light of suggestions made and to be made, the present conference be continued and the legislative sub-committee of each State be instructed and directed to confer with the New York, New Jersey Port and Harbor Development Commission and its counsel and present at an adjourned meeting of this conference, to be held at such time as the sub-committee is ready to report, a revision of the present revised draft of the proposed compact between the States which shall take account of all suggestions that have thus far been made or may hereafter be made; and be it further

Resolved: That it is the sense of this conference that pending the consummation of such compact and the working out of a comprehensive plan for the development of the port, all projects for terminal facilities within the Port of New York shall be submitted to the New York, New Jersey Port and Harbor Development Commission for consideration and advice, to the end that so far as practicable all such projects shall be in harmony with such comprehensive plan when ultimately adopted; and be it further

Resolved: That the New York, New Jersey Port and Harbor Development Commission continue its work; and each State make the necessary appropriation therefor; and that the Legislatures of each State continue the present bi-State Legislative Commission.

Consult 'New York, New Jersey Port and Harbor Development Commission,' Legislative Document No. 103 (Albany 1919).

NEW YORK, University of the State of. For the history, government, administration and various departments of this important institution, see *UNIVERSITY OF THE STATE OF NEW YORK*. As one of the greatest of American State institutions it exists not only for the extension of education, for the benefit of the schools and other cultural institutions of the State, and for the private citizen, but originated primarily in the desire to promote efficiency in the principles and organization of State government. Its headquarters is the New York State Education Building located on Washington avenue, facing the Capitol, Albany, and justly described as "perhaps the most splendid and commodious building devoted wholly to public education to be found anywhere in the world." It has a length of 590 feet, an entire depth of 125 feet, and with the stack wing, an extreme depth of 285 feet. Its beautiful colonnade of exterior lofty Corinthian columns 60 feet high, furnishes a particularly impressive and striking architectural effect. The first floor of the building is used chiefly for the general offices of the State Education Department governing the varied activities of the University. On the same floor are the chief administrative workrooms of the great State Library, the order, catalog and shelf sections. The second floor gives access to the five principal reading rooms, or the group of five special libraries, law, legislative reference and public documents, medicine, periodicals and the spacious and lofty principal reference room. On the third floor are the Educational Extension Division, the Library for the Blind and the Library School. The Library School, the first of its kind, was established in 1887 to supply the demand for trained librarians. The two-year course leads to the degree of bachelor of library science and (1919) nearly 1,000 graduates had passed through the school. On the fifth floor is the State Museum, important from a geological and

paleontological viewpoint, revealing the geography, history, agricultural and mineral resources, the commerce and manufactures of the State. The books of the library are housed in a series of stackrooms conveniently situated with reference to the five reading rooms. The main stack designed to accommodate close to 1,500,000 volumes, is directly under the principal reading room floor. Five of the stack floors are the full size of the reading room. At the east and west sides of the two upper stack floors extend workrooms 165 feet long by 25 feet broad. Corridor stacks between the law and legislative reference rooms and between the medical and periodical rooms provide shelving for 300,000 volumes in addition to the books shelved in the alcoves of these special libraries. Special stacks on the third floor accommodate 100,000 volumes for the traveling libraries and the collection of books for the blind.

Famous names are connected with the history of the library. De Witt Clinton purchased its earliest collection. For over 75 years (since 1844) the Regents of the University of the State of New York have fostered and guided its development and Melvil Dewey (q.v.) made it a dynamic force throughout the world. The library from 1889 occupied portions of the third and fourth floors of the west end of the new Capitol, later spreading to the fifth and sixth floors. In 1906 the legislature made provision for a separate building for the New York State Education Department, including the State Library, but before the building was completed the fire of 29 March 1911 swept away practically its entire collection. The catastrophe was probably the greatest in modern library annals. Half a million of books, 300,000 manuscripts, the costly apparatus of administration—all forming a collection ranking with the first half dozen in the western hemisphere and among the first 20 in the world, were swept away in a few hours. The library is rebuilding its collections with remarkable rapidity and has resumed its place in the educational life of the State with undiminished efficiency.

The multiplying activities of the institution are best studied in the publications of the State Library described and listed in 'Handbook 6, part 2,' of the State Education Department. Copies are sent free to any persons interested. Besides its annual report the Library has published five series of bulletins. The legislation series includes, besides occasional monographs and lists, three annual bulletins which index and review the laws of the various States and digest topically the governors' messages. The history series relates to early New York State history, including reprints or calendars of valuable manuscripts. The bibliography series comprises classified lists of books on various subjects, or relating to individuals or places. This series includes the annual list of best books of each year, which is sent on request to any library. The Library School series embodies lists, outlines, problems and monographs on subjects relating to library economy or the courses of instruction given in the New York State Library School. These bulletins appear also in the bound annual reports of the Library.

New York Libraries is a quarterly magazine devoted to library affairs and interlibrary relations in New York State. It is sent without

cost to all libraries and members of library boards in the State, making application. To others it is sent postpaid for 25 cents a year or 10 cents for a single copy.

NEW YORK, NEW JERSEY PORT AND HARBOR DEVELOPMENT COMMISSION. See NEW YORK, HARBOR OF.

NEW YORK ACADEMY OF SCIENCES, The, was originally incorporated in 1818 under the name "The Lyceum of Natural History in the City of New York." The title was changed in 1876. There are four classes of members in the Association: active, fellows, corresponding and honorary. By special act of the legislature in 1902 it was empowered to collect funds and erect a building for scientific purposes. There are sections on astronomy, physics, biology, anthropology, chemistry, mineralogy, geology and psychology. Annals, memoirs and many pamphlets are published under the auspices of the Society. The academy's library and headquarters are at present located in the Museum of Natural History.

NEW YORK BARGE CANAL. See BARGE CANAL, THE NEW YORK STATE.

NEW YORK CENTRAL RAILROAD COMPANY, The, the incorporate name of one of the great transportation systems of the United States. Having its beginning in 1826 as the Mohawk and Hudson Railroad, with less than 20 miles of track and an equipment of but a single train, this remarkable system, popularly known as the "Four Track Road," has resulted in the consolidation of over 100 small railroads. The early history of the expansion of the system is detailed below. Here it is incumbent to state in some detail the arrangements resulting in the present corporate title. On 22 Dec. 1914 the New York Central Railroad Company was incorporated under the laws of New York, Ohio, Illinois, Indiana and Pennsylvania and under the laws of Michigan on 23 Dec. 1914. The company was formed by consolidation of the New York Central and Hudson River Railroad Company; the Lake Shore and Michigan Southern Railway Company; Geneva, Corning and Southern Railroad Company; the Terminal Railway of Buffalo; the Dunkirk, Allegheny Valley and Pittsburgh Railroad Company; the Chicago, Indiana and Southern Railroad Company; the Detroit and Chicago Railroad Company; the Detroit, Monroe and Toledo Railroad Company; the Kalamazoo and White Pigeon Railroad Company; the Northern Central Michigan Railroad Company and the Swan Creek Railroad Company of Toledo, under agreement for consolidation, dated 29 April 1914. In 1915 the new company merged the Jamestown, Franklin and Clearfield Railway, the Cleveland Short Line Railway, the Sturgis, Goshen and Saint Louis Railway, and the Elkhart and Western Railway. In July 1916, the company sold its controlling interest in the New York, Chicago and Saint Louis Railroad to Cleveland capitalists for \$8,500,000. All shares of the capital stock of any of the consolidating companies which at the time of consolidation were held by any of said consolidating companies were canceled under the agreement for consolidation and the remaining outstanding shares of the capital

stock were to be converted into shares of the consolidated corporation.

The directly operated mileage of the New York Central Railroad Company embraces the main line from New York to Chicago (953.47 miles), and various branches in New York, Ohio, Indiana, Illinois, Michigan, etc. (about 2,749.28 miles); proprietary and leased lines (about 1,527.02 miles); trackage rights (455.66 miles), making a total of 5,685.43 miles. Moreover, the Boston and Albany Railroad (393.02 miles) is leased but separately operated. Other controlled lines separately operated constitute 6,588 miles; making a total in the New York Central system as of 1 Jan. 1919 (less duplications) of 12,413 miles.

This mileage is classified as follows:

Lines owned: New York to Chicago, 953 miles; branches, 2,750 miles. Proprietary and leased lines: Detroit, Toledo and Milwaukee Railroad, 47 miles; Battle Creek and Sturgis, seven miles; West Shore Railroad, 479 miles; Troy and Greenbush, six miles; New York and Harlem, 136 miles; New Jersey Junction Railroad, five miles; Boston and Albany Railroad, 393 miles; Beech Creek Railroad, 164 miles; Beech Creek Extension, 135 miles; Wallkill Valley, 32 miles; Mahoning Coal Railroad, 71 miles; Detroit, Hillsdale and Southwestern Railroad, 65 miles; Lake Erie, Alliance and Wheeling Railroad, 88 miles; Fort Wayne and Jackson Railroad, 98 miles; Erie and Kalamazoo Railroad, 22 miles; Kalamazoo, Allegany and Grand Rapids Railroad, 58 miles; Ottawa and New York Railroad, 57 miles; Saint Lawrence and Adirondack, 56 miles; trackage, 456 miles.

The controlled separately operated lines comprise the Michigan Central system, the Cleveland, Cincinnati, Chicago and Saint Louis system, the Lake Erie and Western, the Cincinnati Northern, the Pittsburgh and Lake Erie, the Chicago, Kalamazoo and Saginaw, the Toledo and Ohio Central, the Kanawha and Michigan, the Zanesville and Western, the Indiana Harbor Belt and the Toronto, Hamilton and Buffalo railroads.

Corporate History.—The growth and development of the New York Central extending over the period from 1826 to the present is typical of American commercial progress. The genesis of the great corporation was the Mohawk and Hudson Railroad, chartered in 1826 and opened 9 Aug. 1831. It was the first railroad built in the State of New York. The name was changed 19 April 1847 to the Albany and Schenectady Railroad Company. Together with nine other small railroads the Mohawk and Hudson was merged into a corporation, organized under a special law, 2 April 1853, called the New York Central Railroad Company.

The Central.—The 10 roads comprising the New York Central were: (1) the Albany and Schenectady; (2) the Schenectady and Troy, chartered in 1836, and opened in 1842; (3) the Utica and Schenectady, chartered in 1833, and opened in 1836; (4) the Mohawk Valley, organized in 1852; (5) the Syracuse and Utica, chartered in 1836, and opened in 1839; (6) the Syracuse and Utica Direct, chartered in 1853; (7) the Rochester and Syracuse, a consolidation of the Auburn and Rochester (1836), and the Auburn and Syracuse (1834); (8) the Buffalo and Rochester, a consolidation of the

Tonawanda Railroad (1832) and the Attica and Buffalo (1836); (9) the Rochester, Lockport and Niagara Falls Railroad, organized in 1850; (10) the Buffalo and Lockport, chartered in 1852, and opened in 1854. This consolidation gave the New York Central a continuous line of railway from Albany to Buffalo. The following roads were subsequently leased and merged into the consolidation: Rochester and Lake Ontario (1855); Buffalo and Niagara Falls (1855); the Lewiston (1855), and the Saratoga and Hudson River (1867).

The Hudson River.—The Hudson River Railroad Company was chartered 12 May 1846. It leased the Troy and Greenbush Railroad, which was chartered in 1845, and in October 1851 opened the new Hudson River line through its entire length from New York City to East Albany. At this stage of the development there were the two consolidated systems, the Hudson River (New York to Albany), and the Central (Albany to Buffalo).

The Consolidation.—On 1 Nov. 1869, the New York Central and Hudson River Railroad Company was organized by the consolidation of the New York Central Railroad Company and the Hudson River Railroad Company. This gave a direct line from New York City to Buffalo. The new company added the following extensive roads to its system: (1) the New York and Harlem, chartered in 1831, and extending from 42d street, New York to Chatham, included a lease of the New York and Mahopac Railroad from Goldens Bridge to Lake Mahopac. (2) The Spuyten Duyvil and Port Morris Railroad, six miles long, chartered in 1869. (3) The Geneva and Lyons Railroad, from Geneva to Lyons, distance 14 miles. (4) The Syracuse Junction Railroad, a local system. (5) The Buffalo Junction Railroad, between East Buffalo and North Buffalo. (6) The Troy Union Railroad, chartered as a terminal line in 1851, and originally owned by the city of Troy. (7) The two Hudson River bridges, owned by the Hudson River Bridge Company, and crossing the Hudson at Albany and East Albany. (8) The Dunkirk, Allegheny Valley and Pittsburgh Railroad leased until 1937. (9) The West Shore Railroad. (10) The New Jersey Junction Railroad. (11) The Beech Creek Railroad. (12) The Rome, Watertown and Ogdensburg. (13) The Mohawk and Malone Railway. (14) The Carthage and Adirondack Railway. (15) The Gouverneur and Oswegatchie Railroad. (16) The New York and Putnam Railroad. (17) The Pine Creek Railway. (18) The Syracuse, Geneva and Corning Railway. (19) The Fall Brook Railway. (20) The Wallkill Valley Railroad. (21) The Boston and Albany Railroad, leased to the New York Central Company from 1 July 1900 for 99 years. (22) Detroit, Hillsdale and Southwestern, leased to Lake Shore and Michigan Southern in perpetuity from 1881; lease assumed by the New York Central. (23) Lake Shore and Michigan Southern. (24) Ottawa and New York Railway. (25) Saint Lawrence and Adirondack Railway. (26) Fulton Chain Railway. (27) Raquette Lake Railway. (28) The Cleveland, Cincinnati, Chicago and Saint Louis and subsidiary roads. (29) Lake Erie and Western. (30) Michigan Central. (31) Pittsburgh and

Lake Erie. (32) Toledo and Ohio Central. (33) Part control of Indiana Harbor Belt Railroad. (34) Part control of Toronto, Hamilton and Buffalo Railway. (35) Part control of the Rutland Railroad Company.

Traffic Statistics.—Average mileage operated year ending 31 Dec. 1917, 5,685.43; freight train miles, 26,619,955; passenger train miles, 27,735,074; milk train miles, 1,101,692; other passenger train miles, 3,811,968; mixed train miles, 94,748; special train miles, 18,614. The revenue freight moved in the same year totalled 110,237,661 tons, or 3,990,291 revenue tons, one mile per mile of road; the average haul per revenue ton was 204.49 miles. Passengers carried aggregated 57,288,436, or 2,546,427,088 passengers carried one mile. On the same date the equipment in service included 1,644 freight locomotives, 717 passenger locomotives, 754 for switching service, 73 electric locomotives and 18 other engines, a total of 3,206 engines. The total number of freight cars was 137,835; passenger train cars, 2,973; company service cars, 7,964, eight tugs, dredges, scows, etc., 10 ferry boats, 21 steel tugs; seven lighters, 37 hoisting barges, 174 grain boats, barges, etc., and 62 car floats.

The corporate income of the New York Central Railroad Company for the year ended 31 Dec. 1918, amounted to \$69,270,920. Of this amount the sum of \$55,802,630 was compensation accrued for use of the properties by the Federal Railroad Administration. The net income of the company was \$17,917,121 and the surplus for the year carried to profit and loss was \$5,321,948. In the same period the number of stockholders increased by 1,591, the total number at the end of the year being 28,693, of whom 28,395 were in the United States and 298 abroad. The par value held by those in the United States was \$247,543,855 and by those abroad \$2,053,500, the average holdings being 87 and 69 shares, respectively. In 1915 the numbers reported were 22,270 in the United States and 2,772 abroad, the general average holding being, approximately, 100 shares, while now it is 87 shares.

During the year ended 31 Dec. 1918, the net corporate income of the Cleveland, Cincinnati, Chicago and Saint Louis Railway Company was \$3,120,363. Gross income of the company was \$10,772,277, of which amount the sum of \$9,938,597 was compensation accrued for the possession of the properties under federal control. Surplus for the year carried to profit and loss amounted to \$2,493,013.

The Michigan Central Railroad Company earned \$8,955,107 during the same period. Of this amount the sum of \$8,052,127 was compensation accrued for the use of the properties under federal control. The net corporate income was \$547,857, and a deficit for the year carried to profit and loss amounted to \$201,598. The balance to credit of profit and loss 31 Dec. 1918, was \$18,448,755. The net income of the Pittsburgh and Lake Erie Railroad Company for the year ended 31 Dec. 1918, amounted to \$5,058,111. The compensation accrued for the possession of the properties by the Federal Railroad Administration amounted to \$8,980,219. The gross income was \$9,544,051, and the surplus for the year carried to profit and loss \$1,459,551. The balance to the credit and loss 31 Dec. 1918, was \$23,427,615.

NEW YORK COURTS. See COURT.**NEW YORK HISTORICAL SOCIETY,**

The, an association organized 20 Nov. 1804 for the collection and preservation of historical matter relating to the United States in general and the State of New York in particular. The collections of the Society are rare and valuable. In the department of antiquities is the Abbott collection of Egyptian antiques, which is considered one of the finest in the world. The art gallery, which contains nearly 1,000 paintings and 200 portraits, includes the Bryan gallery of old masters, the Durr collection, New York Gallery of Fine Arts, the works of the American Art Union and Audubon's original water-colors for his natural history. The library has a valuable collection of books, maps, manuscripts and engravings. From 1857 to 1903 the collection was housed in the Society's building at 170 Second avenue, New York. In November 1903 a new home for the Society at 77th street and Central Park West was dedicated and the historical treasures owned by the Society are now housed in the new building. Among the organizers were Anthony Bleeker, DeWitt Clinton and Peter G. Stuyvesant.

NEW YORK PUBLIC LIBRARY, was established 23 May 1895 by a consolidation of the Astor, Lenox and Tilden libraries. Legally this was an amalgamation of three corporations known as the Tilden Trust, the Trustees of the Astor Library and the Trustees of the Lenox Library. From these institutions 22 trustees were selected from the 33 governing members of the former associations, and to these were added ex officio the mayor, comptroller and the president of the board of aldermen of the city, to serve as members of the new corporation. The official title of the corporation is The New York Public Library, Astor, Lenox and Tilden Foundations. Vacancies occurring in the board are filled by vote of the remaining members. The agreement of consolidation provided for the establishment and maintenance of a free public library and reading-room in the city of New York, with such branches as might be deemed advisable for the continued promotion of the objects and purposes of these several corporations. The Astor Library (266,147 volumes) was founded in 1849 by John Jacob Astor, and his endowment was increased, and land and buildings added, by the beneficence of various members of the Astor family, to a value of \$941,000 at the time of the merging. The Lenox Library (86,000 volumes) was founded by James Lenox, who gave land on Fifth avenue, between 70th and 71st streets, large funds and valuable collections of Bibles, manuscripts and Americana. It received subsequently large endowments from his sister, Miss Henrietta Lenox, from Mrs. R. L. Stuart and others, the total endowment amounting to \$505,000. The Tilden Trust (20,000 volumes), incorporated in 1887, was created by the will of Samuel J. Tilden, made in 1884, which gave his entire residuary estate to trustees to establish and maintain a free library and reading-room. A long contest in the courts resulted, before the termination of the suit, in an agreement of compromise by which the Tilden Trust became possessed of over \$2,000,000.

In 1901 the New York Free Circulating Library with 11 branches and 160,000 books was

added by consolidation, and in the same year the Saint Agnes Free Library and the Washington Heights Free Library joined the combination. In 1903 were added the New York Free Circulating Library for the Blind and the Aguilar Free Library with four branches; and in 1904 the Harlem Free Library, the University Settlement Library, the Webster Free Library and the five branches of the Catholic Free Circulating Library. In 1901 Mr. Andrew Carnegie gave to the city a total of \$5,200,000 for library buildings and equipments and with the portion of the gift allotted to the New York Public Library 37 branch libraries were housed as a part of its activities.

The trustees of the New York Public Library soon after the consolidation in 1885 determined to pursue a liberal policy and to create a great library system not only for the use of scholars, but for the people. The best permanent site for the future great library was considered to be in Bryant Park, on Fifth avenue, between 40th and 42d streets, on the site of the city reservoir, which had become obsolete and was practically unused. On 25 March 1896 the trustees made a formal address to the mayor asking aid from the city in securing the site of the reservoir, and in May 1896 the legislature passed a law authorizing the removal of the reservoir and the lease of the land to the library. On 19 May 1897, another act was passed providing for the construction by the city of a library building on the reservoir site, and for its lease to the library, which act was amended in 1900, removing the limit of cost. On 10 November Carrère and Hastings were selected as architects for the new building, and on 1 December the plans were approved by the city. After delays, owing to the failure to appropriate funds for the work, the removal of the reservoir was begun on 6 June 1899 and the new building was opened to the public on 23 May 1911. Exclusive of the books and collections which it contains, it had been erected and furnished at an expense of about \$9,000,000, on ground valued at about \$8,000,000.

The new library building was not intended to be a great monumental building which would look as well from one point of view as another and which would be fundamentally an example of pure architectural form, but rather an example of dignified and elegant city street architecture. It is described by the architects as "modern Renaissance, more or less of the Louis XVI period, with such modifications as the conditions and needs of our age have suggested." The façade on Fifth avenue has poise and character and seems to issue to the people "an invitation to enter rather than a command." The total quantity of constructive marble in the building is about 375,000 cubic feet, quarry measure. It came mostly from the quarries of Vermont. The general plan is rectangular, 390 feet long on the Fifth avenue front, and 270 feet in depth. It is built around two inner courts and has four floors besides the cellar. The sides and front are comparatively low, the top floor being lighted by windows and skylights; while the centre and rear parts rise much higher and are lighted entirely by windows. The "stack" under the main reading-room is of steel, seven decks in height, with 63.3 miles of shelving—a capacity of 2,500,000

volumes. In addition to this, the special reading-rooms have a shelf capacity of 500,000 volumes. The main reading-room floor has an area of half an acre and there are seats for 768 readers. On its open shelves are 25,000 selected volumes covering every department of human knowledge.

Of the great libraries of the world, the New York Public Library is fourth in size, possessing in 1915 a total of 2,459,996 books and pamphlets. It is notably strong in famous old manuscripts and rare editions; illuminated and Oriental manuscripts; works on American history and genealogy; the history of printing; books belonging in the Oriental, Hebrew and Slavonic departments, and works on the history and illustration of ancient and modern art in all its phases.

The books, manuscripts and maps owned by the library at the close of the year 1918 were valued at \$3,155,354.15, and the paintings, statuary and other works of art at \$266,245.

The library is conducted in two divisions; as a free reference library and a free circulating library; the latter division having 46 branches in various parts of the boroughs of Manhattan, the Bronx and Richmond. (The boroughs of Brooklyn and Queens have each its own separate library organization). The number of books in the reference department on 31 Dec. 1918 totaled 1,091,703, and the number of pamphlets 319,263. The circulating department had 1,187,139 volumes. During 1918 the number of volumes consulted in the reference-rooms, called for by signed slip, was 2,063,265. No record is kept of the volumes taken from the open shelves in any of the reading-rooms. The number of persons entering the library building in 1918 was 2,528,657. The number of readers registering by name in the special reading-rooms was 964,587. The readers in the newspaper-room do not register.

In the library building, besides the great reading-room there are 18 special reading-rooms, devoted to the following named departments: Americana (with 46,000 volumes); genealogy (30,000 volumes); music (22,000 volumes and pieces); art (25,000 volumes); prints (20,000 volumes); Jewish literature (24,000 volumes); Oriental literature (20,000 volumes and pamphlets); Slavonic literature (23,000 volumes and periodicals); science (35,000 volumes); economics and public documents (400,000 books and pamphlets); patents; technology (65,000 volumes); current periodicals (400); newspapers (60 dailies and 25 foreign); maps; manuscripts; library for the blind (8,000 raised letter volumes and 5,500 music scores); and the children's reading-room (12,000). There is also a library school giving a two years' course, with, in 1918, 48 pupils. The library has a complete printing office and bindery. The former supplied in 1918 388,613 printed catalogue cards and 8,956,897 pieces of printed stationery. The bindery bound 34,678 volumes and handled over 14,000 pieces of miscellaneous work.

In the circulating department the number of books issued from all the branches for home reading in 1918 was 9,627,505, of which total 3,955,113 were children's books. The Central Branch, located in the library building, issued 616,372 volumes in the year, an average of 1,700 books per day, and 130 for each working hour.

The aggregate attendance for the year in the reading-rooms connected with the branch libraries was 3,630,074.

The extension division of the library covers 6 sub-branches and 411 agencies in outlying districts, community centres, schools, business offices, factories, fire and police stations, hospitals, prisons, etc. This service is continually being extended, the agencies being expanded into sub-branches, and the latter into full-fledged branches as the library needs of the locality may develop. The yearly circulation of books controlled by this department numbers 195,330 volumes.

The library is managed by a director and staff of 1,224 assistants (in 1915). Of these, 534 were in the reference department and 679 in the circulating department. The reference library and the Central Branch of the circulating department are maintained entirely by the income from the library's endowment funds and without financial aid by the city. The library issues annually a 'Handbook,' and publishes weekly the *Staff News* for information of the personnel.

NEW YORK STATE UNIVERSITY.

See UNIVERSITY OF THE STATE OF NEW YORK, THE.

NEW YORK UNIVERSITY, established in 1830 in New York City. The first steps toward the founding of the university were taken in December 1829, when nine prominent citizens of New York met to discuss the project of establishing an institution of higher learning in the city. Through their efforts the co-operation of various literary and scientific institutions was obtained, a standing committee was organized and \$100,000 subscription raised, most of which was contributed in comparatively small sums. In 1830 the university council was elected by the subscribers and the university incorporated in 1831. In 1832 the collegiate department was opened for instruction. The ideals of the university were from the first most liberal; the address of the standing committee issued in 1830 stated three fundamental principles which have been consistently adhered to: (1) "The object of the University shall be to extend the benefits of education in greater abundance and variety and at a cheaper rate than at present they are enjoyed"; (2) "Persons of every religious denomination shall be eligible to all offices" that the university may never be under sectarian control; (3) Those attending the university shall pursue studies according to their own preference "having an unlimited choice of the branches taught in the institution."

The present organization of the university includes nine schools, besides the Summer School, Extramural Division and the Woman's Law Class. These schools are the College of Arts and Pure Science (founded 1832), the School of Applied Science (1862); the Graduate School (1886); the University Law School (1835); the University and Bellevue Hospital Medical College (founded as the University Medical College in 1841); the School of Pedagogy (1890); the New York State Veterinary College (established at New York University 1899); the School of Commerce, Accounts and Finance (1900); the Washington Square College (1913). The university senate comprises the deans of the Union Theological Seminary, the

General Theological Seminary and the Drew, New Brunswick, Catholic and Jewish theological seminaries. The work of the University College, which had always been largely elective, was in 1894 arranged for the group system; since then the arrangement of groups has been altered, but the principle has been most satisfactory; the groups include the classical, the classical scientific, the Semitic language and literature, political science, philosophy, natural science, exact science and medical preparatory. The work of the School of Applied Science is arranged on the same principle; the courses include civil, mechanical and chemical engineering. The School of Pedagogy was the first university school to put professional instruction in pedagogy on the same plane with the professional university instruction in law and medicine; it was also the first school to establish degrees in course in pedagogy. The Medical College in 1898 was consolidated with the Bellevue Hospital Medical College under its present name; in 1896 this college began requiring a four years' course for all students; this action was in advance of State requirements, as the State law making a four years' course obligatory was not passed till the next year. No university in the Eastern States has grown relatively so fast as New York University; within 20 years (1902) the number of students has more than trebled and the value of its property more than quadrupled. The period of its greatest growth has been since 1891, when a site for a new campus was purchased on University Heights, containing about 23 acres. The University College and the School of Applied Science were moved there in 1894, the summer school is located there and the scientific work of the graduate school is also done there; the other departments, with the exception of the medical and veterinary, are at Washington Square. Since that time the curriculum has been enlarged, two new schools besides the summer school have been organized and the number of students steadily increased. The university organization has also been completed and the various schools closely affiliated under the government of the university senate. This senate consists of the chancellor, the deans of the various schools, one professor from each of the schools and advisory members.

Among the buildings on University Heights the most notable is the library building. An adjoining colonnade, with museum below, is known as the Hall of Fame (q.v.). The library emphasizes the seminar rooms, of which there are 18, each with its stackroom adjoining; the greater number of the books are in these seminar stacks; in 1923 there were 189,000 volumes. The total value of the university plant in 1922 was approximately \$5,436,723. The students in 1922-23 numbered 12,910, the professors and lecturers and instructors 708.

NEW ZEALAND, an autonomous state in the Pacific Ocean, 1,200 miles east of Australia, consisting of two principal islands known as North Island and South or Middle Island, besides Stewart Island south of Middle Island, and several small outlying islands. The group lies between lat. 34° 20' to 47° 30' S.; long. 166° to 178° E. The length of the group, north to south, is about 1,000 miles; the maximum breadth 180 miles; it has a coast line of

3,000 miles; and an aggregate area of 104,751 square miles. North Island comprises 44,130 square miles, Middle Island 58,120 square miles, Stewart Island 662 square miles, total 103,581 square miles, the rest being divided among Cook and other islands in the Pacific Ocean, since 1901 officially attached to the colony. New Zealand is divided into nine provincial districts, of which four—Auckland, Taranaki, Wellington and Hawke's Bay, are in North Island, and five—Nelson, Marlborough, Canterbury, Otago and Westland, in South Island. The areas and population of these provincial districts are as follows:

PROVINCIAL DISTRICT	Area, square miles	Population, 1916		
		Males	Females	Total
Auckland.....	25,364	155,298	153,468	308,766
Taranaki.....	3,732	28,775	27,150	55,925
Hawke's Bay.....	4,241	27,194	27,073	54,267
Wellington.....	10,807	119,572	112,542	232,114
Marlborough.....	4,225	8,506	8,102	16,608
Nelson.....	10,875	22,415	20,836	43,251
Westland.....	4,881	8,088	7,414	15,502
Canterbury.....	13,858	88,085	93,784	181,869
Otago:				
Otago Portion.....	13,957	63,546	67,972	131,518
Southland Portion..	11,355	30,296	29,333	59,629
Totals.....		551,775	547,674	1,099,449

The population of North Island in the same year was 651,072; South Island, including Stewart Island and Chatham Island, 448,337. The total population was 1,162,293, including 49,776 Maoris and 12,797 inhabitants of Cook and other islands politically connected with New Zealand. Of the population 506,988 lived in rural districts and 592,461 in cities.

Topography.—New Zealand is one of the loneliest of civilized countries of any importance. The shortest sea voyage between its ports and those of Australia is a run of 1,200 miles. It is separated from the coast of Chile by 4,000 miles of open ocean, while north and south empty sea wastes stretch to the Antarctic and Polynesia, respectively. The archipelago itself, when the voyager at length reaches it, stands boldly up, showing, as a rule, steep shores backed up by a hilly or mountainous interior. The three main islands have a coast line of about 3,000 miles. Long curving beaches of sand or shingle, backed by cliffs or sand-dunes, often extend for many leagues. But even where the hills do not thrust their sides or spurs into the surf, they are so seldom far away, and on the east coast are usually so clearly visible through the bright atmosphere, that the first impression left by New Zealand is of a chain of half-submerged highlands, broken, precipitous and picturesque. When, as on the mid-east coast of the South Island, or on the west of the North Island, the shores themselves are low-lying and commonplace, the striking background catches the eye and redeems the landscape. It is, however, where the mountains meet the ocean, or where long sea-arms wind in among the ranges, that the coastal scenery is found, the fame of which has gone abroad. In many of the sounds of the southwest a combination of grandeur and soft loveliness is seen, exceeding in sublimity the sea coast be-

tween Alaska and Vancouver and in richness and color leaving the Norwegian fiords behind. Among inlets other than these, Cloudy Bay and Blind Bay in the South Island and the Hauraki Gulf, the Bay of Islands, Wangaroa and Hokianga are, perhaps, the more noted. Wellington, the capital, stands on a noble harbor, Port Nicholson. For commerce, the harbors of the colony are often less convenient than might have been looked for in a group so narrow and deeply indented. The southwestern sounds aforesaid give access only to uninhabitable Alps. From Martin's Bay northward there is not a single port on the western coasts which is not hampered by a bar. Kawhia, the best of them, lies out of the way of settlement. Even on the east coast, Lyttelton, Port Chalmers and Napier, the third, fourth and sixth ports of the colony, have had to be improved at great cost, and the same is the case of Bluff Harbor, the port of departure at the south end of the country, and with Westport and Greymouth, where most and the best coal is shipped. The truth is that many of the deep, sheltered gulfs are not just where traders would wish to have them. Fortunately, Wellington and Auckland are exceptions and these have become the two chief ports of New Zealand.

The official area of New Zealand is 104,751 square miles. This includes not only the smaller coastal islands of New Zealand proper, but outlying groups like the Chathams (q.v.) to the east, the Auckland (q.v.) to the south and a number of Polynesian islets (the chief of which are the Cook Islands (q.v.) and Niue, which politically belong to the colony. Of the whole area, the North and South islands cover all but about 2,000 square miles. In size as in configuration and climate, New Zealand may be more fairly likened to Italy and Sicily than to the British Islands. Long mountain ranges form a backbone, stretching — save for the gap made by Cook's Straits — from Puysegur Point at the extreme southwest of the South Island to the East Cape and the Bay of Plenty in the North Island. Between lat. 43° and 46° the summits rise into the region of eternal snow. Several of them reach heights of between 10,000 and 12,000 feet and Aorangi (Mount Cook), the highest peak in the islands, attains 12,349 feet. Here are glaciers, which on the western slopes descend and penetrate the evergreen pine and beech forests, while on the eastern side their size surprises geologists and mountain climbers. Some of the figures showing their extent are these:

NAME	Area of glacier	Length of glacier	Greatest width	Average width
	Acres	Miles ch.	Miles ch.	Miles ch.
Tasman....	13,664	18 0	2 14	1 15
Murchison...	5,800	10 70	1 5	0 66
Godley.....	5,312	8 0	1 55	1 3
Mueller....	3,200	8 0	9 61	0 50
Hooker.....	2,416	7 25	0 54	0 41

Among these ranges lie seven large and many small lakes. They vary greatly in beauty, but Wakatipu, Manapouri and the western arms of Te Anau challenge comparison with the lakes of Switzerland.

North of the 43d parallel the mountains, though somewhat less in height, are no longer

a backbone merely. They extend right across the island and the seaward flank of one fine double range, the Kaikouras, towers above the eastern coast. The broken and difficult surface of the northern end of the South Island has had a marked effect on the course of settlement and politics. Southward from the Kaikouras population is growing fairly dense along the eastern and southeastern coast as far as the district served by Bluff Harbor. In this stretch is found the largest flat plain — Canterbury — in the islands and many roomy valleys, flats and manageable slopes. The open, grassy character of the land made rapid occupation easy. Two-fifths of the population of the colony are to be found between the points last named, within 40 miles of the coast. To the north, however, settlement is still thin and patchy; the southern railroads stop 80 miles short of Cook's Straits; the southern provinces communicate with Wellington by a line of steamships from Lyttelton, halfway down the South Island. As if to separate the bulk of the North Islanders still more from the majority of the Southerners, nature has made the butt end of the North Island, for 30 miles behind Wellington, poor, wind-beaten and hilly. Only after leaving this unattractive knuckle-end do we come to fertile expanses on both sides and in a central hill-encircled plain, the Wairarapa. Except in the east round Napier, on Hawke's Bay, very little of this attractive country is a dead level. Rolling downs, steep hills of moderate height, narrow, rich river-valleys, mark it everywhere. Great tracts of it are, or were, clothed with thick forest, the rest mainly with tall bracken. Generally the note within 40 miles of the coasts is fertility. A green, moist, warm land more suited, as a rule, for pasture, spreads along the west coast as far north as the mouth of the river Waikato and on the east to the mouth of the Rangitaiki, on the Bay of Plenty. The centre of the island is a plateau of from 1,200 to 2,000 feet in height, lying round Lake Taupo and dominated by volcanic cones, of which several are active and others have exploded within man's memory. Ngauruhoe (7,550) and Ruapehu (9,008) are the most restless of these. The most beautiful rises, not on the plateau, but out of the plains by the western shore. It is the solitary, symmetrical Egmont and is 8,250 feet high. A line drawn through Ruapehu northwestward to White Island, in the Bay of Plenty, passes through a tract of about 650 square miles incessantly disturbed by volcanic activity. Warm or boiling springs, geysers, pools of boiling mud, fumeroles, solfataras, colored lakelets are numerous. Cold lakes and waterfalls add to the picturesqueness and the healing powers of the thermal waters and complete the attractions of a much-visited district.

In and near this volcanic territory the soil is mingled with pumice and is not suitable for grass, though trees and long-rooted plants may do well there. South of Lake Taupo and east of the great volcanoes, a patch of true desert is encountered. Bordering on the comparatively barren pumice area is found both to the east and west the fertile country already referred to. Here the usual formation is that locally called *papa*. This is a calcareous stratum resembling soft limestone and the fertility of even the most broken hilly surfaces of the *papa*

ST

districts was attested by the fine trees and tall bracken which usually covered them. These are now giving way to the cultivated grasses of the settlers.

The deep, richly clothed gorges cut by the rivers of these districts supply the most romantic river scenery of the islands, notably in the valleys of the Wanganui and the Mokau.

North of lat. 38° the island narrows into a long peninsula, indented again and again, and well nigh cut in twain where the Waitemata (the harbor of Auckland) almost meets the Manukau. In this northern division the climate of the east coast differs little from that of the west, for there is no central spine; save on the hills, frost is rare; north of the 38th parallel, indeed, the mangrove fringes the shores and palms, olives, oranges, guavas and the cane-break flourish. Here is the home of the giant Kauri pine and here are the swamps and hillsides from which is dug the fossil resin, the kauri gum of commerce. The ocean is too near at hand and too cool for the northern peninsula to be oppressively hot, and, were its soil everywhere fertile, it might be more thickly settled than any other province. Unluckily its strips and spots of rich alluvium are surrounded by larger tracts of stiff clay-marl, only productive after intense and skilful cultivation.

In New Zealand it is the western coast which is the wetter, milder, more luxuriant clothed side. On the eastern, large tracts were found by the whites, quite treeless and clothed with coarse tussock grass. Here pastoral settlement made a beginning, spreading rapidly into the central ranges, to be checked in the South Island by the forests of the saturated west. In the North Island the climatic distinction is less marked and there the grazier flourishes in the west, after the native vegetation has been burned away.

Rivers.—Most of the very numerous rivers show the characteristics of mountain torrents, the rapidity and the cold, pure water running low in summer and disturbed by sudden turbid floods. It says much for the rainfall that very few streams run dry at any time. The volume of water in many is remarkable, notably in the chief river of the South Island, the Clutha, which, despite its strength, is but 154 miles long. In the north, the Waikato is the longest stream in the colony, and that, and four or five others (in the Auckland and Wellington provinces), are navigable by small steamers. Generally the rivers hinder rather than help traffic, though their swiftness and number make them very valuable in furnishing power for machinery.

Climate.—The yearly rainfall varies from 26 inches on the littoral of Canterbury, to 170 inches among the sounds of the southwest. Throughout the settled districts the average is about 35 inches on the eastern and 60 inches on the western side. The brisk sea winds keep the sky normally clear and the amount of sunshine registered is large, except in the southwest and immediately inland of Mount Egmont. In a country stretching through 13 degrees of latitude the climate naturally is very varied, but generally is very healthful. In the northern peninsula of North Island the conditions are semi-tropical, while in the high lands of Otago

and Southland the frosts in winter are very severe and the summer bracing and temperate. In Wellington, which may be taken as the centre of the country, the temperature scarcely ever falls more than one or two degrees below freezing point; while in Auckland, the most northerly of the large cities, the heat is tempered by sea breezes and never reaches the intensity which makes life in summer so trying in the great Australian cities. Rapid changes of temperature are caused by sudden shiftings of wind and are somewhat trying to new arrivals in the country.

Geology and Mineralogy.—To the geologist the two large islands are a continuity, and form the remnant of a continent which once extended eastward and was probably connected with South America. A great leading range of Palæozoic rocks stretches through both islands, branching out in the south to enclose the extensive schistose area of central Otago. Upper Mesozoic formations have also enormous development; and in the North Island their outcrops are distinguishable through the volcanic deposits which cover a good part of the surface. In this island are also extensive areas of hydrothermal agency, marking the expiring activity of volcanic outbursts. So late as 1886 there was a violent eruption of Mount Tarawera in the Hot Lake district, during which the celebrated Pink and White Terraces of world-wide fame as natural wonders disappeared; it was previously supposed to be an extinct volcano; Mount Tongariro and Ngauruhoe, in the heart of the island, also are still active. Sedimentary rocks, chiefly of gray sandstone, are often seen, both among the ridges of the interior, and on the coast, where they frequently form precipitous cliffs, but the far greater part of the rocks are crystalline. Among a great variety of fossils the most notable are those of a gigantic bird, the moa (*Dinornis giganteus*), which survived down to recent times. New Zealand is extremely rich in mineral deposits, and gold mining forms one of its staple industries. Gold was first discovered in 1853, and the total value of the output to the end of 1916 was \$429,238,375. The great gold producing regions are the Thames district of Auckland, the west coast of the South Island and the interior of Otago. During the last few years the method of raising gold by dredging the beds of rivers has developed to a remarkable extent. The extensive coal measures are also a source of wealth. Among many varieties the best is the bituminous coal of the west coast of the South Island, which is equal in quality to that found in any part of the world. The output has been steadily increasing, and for 1916 amounted to 2,257,135 tons valued at \$6,455,145. Copper, chrome ore, manganese ore, sulphur and other minerals have been worked with varying success. Working miners make good wages, and there is a good deal of independent prospecting. Mining schools have been established in different parts of the colony, and the study of mineralogy is pursued with considerable zeal.

Flora, Fauna, etc.—Among vegetable productions the most characteristic are the ferns (130 different species), which forms almost the only vegetation over immense districts. Some of them are more than 40 feet high, and remarkable for the elegance of their forms. The

flax plant furnishes an article of export. A number of the forest trees furnish valuable timber, among them the rare kauri or damar pine. Flowering plants are remarkably scarce, save in the Alps, and there are no indigenous fruits.

In animals New Zealand is singularly deficient, only a sort of dog, now extinct like the moa, a rat and two species of bats being indigenous. Rabbits have been introduced and have multiplied so as to become a perfect pest; pigs now run wild, as well as cats. Pheasants, partridges, quails and red and fallow deer have been successfully introduced, also the brown and rainbow trout. All the common European quadrupeds appear to be easily acclimated. Pigeons and parrots are the most common native birds. Among others are the apteryx (a wingless bird), the huia, the tui, or parson-bird, and the owl-parrot. The chief reptiles are a few lizards. The coast waters teem with fish, and seals are still numerous in some parts.

Population.—The population is now about 1,162,293, or over 11 to the square mile. It is still very scanty in the western half of the South Island; in the interior of the North Island between lat. 40° and 38°; in the great shoulder between Hawke's Bay and the Bay of Plenty; and in the far north of the Auckland Peninsula. Elsewhere it is steadily spreading

100 females were enumerated in 1916. The increase by excess of births over deaths is satisfactory. This is mainly due to the extraordinarily low death-rate which, contrary to predictions, does not rise, and remains the lowest of any civilized country. In 1916 the death-rate stood at 9.64 in the thousand, as compared with a birth-rate of 25.94. The excess rate in favor of life takes a high place in the tables of international vital statistics. During the 12 years 1880-92, the birth-rate fell rapidly from 40.78 to 27.83. The fall then grew much slower, though it continued until 1899, when the rate stood at 25.12. Since then it has gradually recovered. The proportion of children to each marriage is now about 3.14 as against 5.01 in 1885. The marriage-rate was 7.47 in 1916. The percentage of illegitimate births was 4.01. There can be no doubt that the decline in the birth-rate was almost entirely due to the deliberate limitation of families by potential parents. It is believed that the Maori tribes mustered about 65,000 at the time of annexation. Their decrease since has been mainly due to the prevalence among them of tuberculosis and venereal diseases.

The movement of the white population in three recent years is given in the following table:

YEARS	Total births	Illegitimate births	Deaths	Marriages	Excess of births over deaths	Immigrants	Emigrants	Excess of immigration over emigration
1914.....	28,338	1,302	10,148	9,280	18,190	37,646	*32,506	5,140
1915.....	27,850	1,152	9,965	10,028	17,885	25,551	*22,476	3,075
1916.....	28,509	1,146	10,596	8,213	19,913	21,799	*21,163	636

* Exclusive of expeditionary force.

over the land up to a height of about 1,500 feet above sea-level. The advance, however, has never been rapid. The warlike native tribes, from whom land has had to be acquired by tedious purchase, have not been the only obstacle. To the difficulties of the stiff clay-marl and pumice soils must be added the denseness of the forest, the oft-recurring hill and mountain barriers and the innumerable ravines and swift torrents, making roads and bridges very costly. Furthermore, a small archipelago placed in the southern ocean to be a lonely outpost of civilization does not attract any full stream of immigrants from Europe. So 21 years after annexation the white population had reached but 99,021. In 1881 it had attained to 489,923. In 1891 it was but 626,658. The colored population of 49,776 was stationary for many years but a slight increase has been observed recently. The Maori and Polynesians do not as a rule increase. The Chinese, who in 1881 numbered 5,000, have been reduced to 2,500 by exclusion laws—modified copies of those of the United States. The official census of March 1901 returned a population of 815,862 persons, or, excluding Maori and Polynesians, 772,719. The latter number had risen by 15 Oct. 1916 to 1,099,449, an increase of 7.3 per cent per annum from 1901. Of this population 551,775 were males and 547,674 were females. An excess of males over females is also found among the Maori, while among the Chinese less than

Between 1870 and 1885 the gain by immigration was relatively large; but in the seven years, 1885-91, the colony actually lost 20,000 people, mainly to Australia. There has been a gain since 1892, coming mostly from Australia, and the remainder from Great Britain. The government encourages certain classes of emigrants, notably farmers, farm laborers, domestic servants and navvies, by paying part of their passage money. Exclusion laws have been passed to shut out criminals, prostitutes, lunatics, aged paupers and the diseased or crippled. With a view to restricting Asiatic immigration the New Zealand Parliament in 1907 passed an act which requires that any Chinese proposing to land in the dominion shall be able to read a printed passage of not less than 100 words of the English language. Persons of other than European descent are classified in the immigration returns as "race aliens" and have to pass an education test before admission. In addition to the landing tax of £100 on Chinese the government has the right to subject non-British incomers to a language test. Apart from those relating to Chinese and disease it cannot be said that all the restrictive regulations are stringently enforced. The colony relies mainly on its distance from large centres, the cost of the voyage to it and the smallness of its quiet towns. It offers few attractions to active criminals, and is too remote for paupers.

The proportion of females to every 100 males

NEW ZEALAND — NATIVE TYPES

Maori King and Queen — Waitaka Tribe

1 View of Auckland, from Ponsonby

in New Zealand was 70.52 per cent in 1871; 88.26 in 1891; 90.33 in 1901 and 99.2 per cent in 1916.

In 1911 the total Protestants numbered 808,801; Roman Catholics, 140,523; Jews, 2,128; Pagans, 1,501 and 35,905 who objected to state their religion.

Of the white foreigners, by birth or descent, a considerable majority are of Teutonic or Scandinavian blood. New Zealand in recent years has received increasing numbers of Irish settlers. These now equal in number those of Scottish descent. The increasing democratization and the break up of industrial feudalism in New Zealand is in no small measure due to these settlers imbued with Republican sentiments from their earliest years.

Chief Towns.—New Zealand is a decentralized country. Its main centres of population are the four towns of Auckland, Christchurch, Dunedin and Wellington. Of these Auckland is the largest as it is the most beautiful, while Wellington, the political capital, is overhauling its rival. No other first-rate harbor is found on the North Island within 500 miles of the capital. It is the financial and banking centre of the islands and the rapid expansion of its sea-trade suggests that it may yet challenge Auckland's leadership. Auckland taps the grazing and dairying valley of the Waikato, the quartz goldfields of the Thames, Coromandel and Waihi, and conducts a trade with the South Seas as well as with Australia. Christchurch is the market-town of the chief agricultural district, and is something of a manufacturing as well as an educational centre:

POPULATION OF CHIEF CITIES.

Auckland.....	133,172
Wellington.....	95,235
Christchurch.....	92,733
Dunedin.....	68,716
Wanganui.....	19,517
Invercargill.....	17,862
Napier.....	15,131
Palmerston North.....	14,006
Timaru.....	13,716
Gesborne.....	12,660
Nelson.....	9,962
New Plymouth.....	9,795

Christchurch lies inland, about five miles from its seaport, Lyttelton. The other three towns are seaports though most of the shipping trade of Dunedin is done by Port Chalmers, seven miles from the city, and outside its ring of suburbs.

Wellington, close packed between steep hills and sea-shore, is already complaining of congestion, high rents and the lack of garden-space.

The other towns are roomy and comfortable enough, with well-planted, neatly-kept suburbs and spacious recreation grounds. There are no sky-scrapers and no slums. Wood is still the chief material in dwelling-houses, and the ratio of inhabitants to each house is 4.82.

Industries—Agriculture.—The founders of New Zealand looked forward to making it an agricultural settlement and it remains mainly devoted to grazing and mining. The deliberate state encouragement of small as against very large holdings of land has not substituted tillage for grazing. The small farmer is a dairyman more often than not, or he owns a few hundred sheep and develops mixed farming. Two-thirds of the surface of New Zealand are suitable for agriculture and grazing. About 17,000,000 acres are still under forest. The total area under crop (including 14,734,989 acres in sown grasses and 84,649 in fallow) in 1917 was 16,841,575 acres. The total area of land under occupation in the same year was 29,404,291 acres. The area of Crown lands surveyed and open for settlement on 1 April 1917 was 967,566 acres. In South Island are a great number of the larger freehold estates. The size and number of occupied holdings according to recent statistics are as follows:

SIZE OF HOLDINGS	Number of holdings	Acres
1-10 acres.....	15,454	69,390
11-50 ".....	12,748	358,726
51-100 ".....	9,122	708,228

641-1,000 ".....	3,895	3,149,598
1,001-5,000 ".....	5,284	10,366,504
5,001-10,000 ".....	517	3,593,266
10,001-20,000 ".....	277	3,880,927
20,001-50,000 ".....	165	5,126,470
50,001 and over.....	64	5,785,986
Total.....	77,229	41,262,193

There are about 128,000 persons, including 30,000 females, engaged in agricultural, pastoral and dairying pursuits. The acreage and produce of the principal crops are as follows (see table below):

It was the fall in the price of cereals followed by the discovery of the use of refrigeration applied to the transport of food products which turned New Zealand farmers from cereals to meat, butter and cheese. They found that cultivated grasses,—cocksfoot, timothy, clover, rye-grass—would grow admirably in the islands, carrying and fattening far more stock than the native pastures. They began the process of laying down land in cultivated

grasses, with which 14,734,989 acres are now clothed. The export of frozen meat dates from 1882, when 1,707,328 pounds were sent to London. The rapidity of its growth may easily be shown:

MEAT EXPORT.

Year.	Lbs.
1885.....	33,204,976
1890.....	100,934,756
1900.....	206,621,072
1908.....	237,473,936
1916.....	372,517,040

Butter and cheese began to be sent across the sea in 1889, and has been exported regularly since, mainly to the British Isles. The increase in the case of butter has been large and continuous:

EXPORT OF BUTTER.

Year	Cwts.
1900.....	163,871
1908.....	229,971
1912.....	378,117
1916.....	358,632

Cheese has advanced in 30 years from 26,558 hundredweight to 949,416 hundredweight in 1916.

One of the two products much of which goes to the United States is the fibre of the native flax, the New Zealand hemp of commerce. The export of this has increased of late years. The value of the export in 1916 was \$3,154,080.

Minerals.—So far, the only three minerals exploited in a large way have been gold, coal and kauri gum. Good bituminous coal, also brown coal and pitch coal, is found in many districts, notably on the west coast of the South Island, in Otago and Southland, and in the valleys of the Waikato and Mokau. The bituminous coal of the west coast is equal to any in the world and is used by the British navy in the Eastern seas. In the domestic market, the local mines hold their own well and the total output increases steadily as the figures below show:

Year	Tons
1885.....	511,063
1895.....	726,654
1905.....	1,585,756
1916.....	2,257,135

The total value of the gold produced since the year 1853 up to the end of 1914 was \$414,769,550. The greater part of this is now extracted from quartz. In many mines the cyanide process of extraction or separation is used. About one-fifth of the gold is obtained by dredging, chiefly in the river beds of the South Island. In all about 10,500 persons are engaged in gold mining. Gold production in 1915 reached 422,825 ounces valued at \$8,472,765; in 1916, 296,620 ounces were recovered, valued at \$5,996,060.

The yield of silver amounted to 957,541 ounces in 1915 valued at \$477,915, and to \$787,053 ounces in 1916 with a value of \$425,555.

The average value of the kauri-gum export is roundly \$2,500 a year although a decline was noticeable in 1915 and 1916. In the latter year the value was \$1,696,715. Though it is a monopoly, the price fluctuates considerably. Almost all of it is sent to London or the United States, where it is chiefly used in the preparation of varnish.

Iron ore has not yet been turned to commercial account. In May 1906 a petroleum spring was tapped near New Plymouth from which oil flowed at the rate of 100 barrels a day. In 1915 194 tons of tungsten-ore, valued at \$138,920, were produced; in 1916 this was increased to 266 tons valued at \$245,350.

Trade.—In proportion to population the external trade is large. This is the more remarkable as there is virtually no transit trade. The imports are for local consumption only; exports represent local production. Up to 1886 imports exceeded exports; since that year the position has been reversed.

YEAR	Total imports	Total exports
1912.....	\$104,872,870	\$108,852,905
1913.....	111,441,510	114,933,610
1914.....	109,280,480	131,305,235
1915.....	108,644,170	158,744,560
1916.....	131,696,415	166,434,685

The total for 1916 included specie, duty-free imports and those subject to duty. The principal imports and exports for that year were:

The trade is chiefly with Great Britain, Australia and the United States.

The distribution of trade with different countries covering the years 1915 and 1916 appears in table top of page.

It will be seen that the United States almost monopolize such foreign trade as there is. A Preferential Trade Act passed in 1904 imposed special duties of from 20 to 50 per cent on many foreign imports in the hope of transferring trade to Great Britain, but the effect of the law, though appreciable, is not yet large.

Manufactures.—The chief manufactures are meat-freezing, butter and cheese-making, grain milling, tanning and wool-scouring, engineering, saw-milling, clothing, boot and shoe-making, printing, flax milling. The number of establishments—omitting all government workshops—are officially given as 2,459 in 1896, and 4,670 in 1916. The total approximate value of the land, buildings, machinery and plant used in the year first named was \$28,980,000. The sum rose to \$109,757,880 in 1916. The returns, however especially of the first named year, are incomplete. The same criticism applies to the official estimates of the number of hands employed in factories and workshops. The official figures in by-gone years were taken on a different system to the present. It is probably very nearly correct to say that 30,000 hands were employed in factories and workshops of all sizes, State and private, in 1891, against 33,000 in 1895; 55,000 in 1900 and 57,823 in 1916. The total value of production in 1916, excluding the value of the output of the government railway workshops and government printing offices, and also those industries of which there were less than four plants or workshops in operation, was \$227,270,920. In the same year there were registered 4,670 manufactories employing 57,823 persons, and with an invested capital aggregating \$109,757,880. The principal industries, with the value of their products, are as follows:

VALUE OF INDUSTRIAL PRODUCTS (from 'Census of Manufactures, 1916').

NATURE OF INDUSTRIAL ESTABLISHMENTS	Value of output
Meat freezing and preserving.....	\$63,067,855

Railways.—As late as 1870 there were but 46 miles of railway open for traffic. This had grown to 2,989 miles in 1917, of which all but 29 miles were owned and worked by the government. The number of passengers carried on the State lines in 1916–17 was 14,173,115; weight of goods carried, 6,239,173 tons; total revenue for year, \$24,004,050; expenditure, \$14,634,320; net revenue, \$9,369,730. The total expenditure on construction of all government lines, open and unopen, to 31 March 1917, was \$190,935,865. Owing to the physical divisions, broken surface and small population of the colony, the railway system is difficult to manage cheaply. Public opinion demands safety, comfort, low freight charges and good pay and short hours for employees. All these *desiderata* are obtained.

Posts and Telegraphs.—The receipts of the Post and Telegraph Department for the year ended 31 March 1917 were \$9,046,585, with

working expenses for the same period aggregating \$6,854,050. The department had in its employ on the above date 10,194 persons. The government owns and operates the telegraph system, which has 13,896 miles of line and 50,320 miles of wire. In the year ended 31 March 1917, 10,875,120 messages were sent, of which 10,734,168 were private and press dispatches. The telegraph and telephone revenue for the year named above was \$4,222,620. In 1916-17 the Post-office Department handled 242,121,361 letters, 8,133,697 post cards, 48,868,537 books, 41,807,999 newspapers, 6,085,103 parcels, issued 669,355 and paid 567,184 money orders.

Shipping.—There were registered in 1916 190 sailing vessels of 21,853 net tons and 390 steam vessels of 70,442 tons, making a grand total of 580 vessels of 92,295 net tons. Soon after the outbreak of the European War in 1914 many vessels of the New Zealand Register were transferred to the London Register in order to advantage of the War Insurance rates of the Imperial government. In 1916 574 vessels aggregating 1,448,517 tons entered New Zealand ports and 590 vessels aggregating 1,491,593 tons cleared from the same ports.

Government Undertakings and Labor Legislation.—As landlord, railway, telegraph and telephone operator and constructor of public works, the state is a considerable employer of labor. But though the government does most of the business of land transfer, and conducts that of life, accident and fire insurance, is the chief trustee of intestate estates, and works coal mines, it does not systematically compete with private enterprise. It does, however, regulate and supervise industry to an extent unsurpassed in any other democratic and civilized country. The Department of Agriculture disseminates information, inspects flocks and herds, slaughter-houses and dairy factories; examines, grades and brands food products and certain other exports. Its work is believed to be honestly and efficiently done. The Department of Labor inspects all factories, workshops and retail shops, however small, and controls servants' registry offices, even fixing the scale of fees that these last may charge. A Shop Hours Act restricts the business hours of retail shops and the working hours of merchants' clerks.

A Workmen's Compensation Act outruns in liberality the English law upon which it is based. But the most remarkable statute dealing with the relations of employers and workpeople is the Industrial Arbitration Law, passed in 1894, amended in 1908 and again in 1914, for the purpose of superseding strikes and lockouts by the arbitration of State tribunals empowered to give decisions legally binding. Under this elaborate enactment compulsory awards may be given or agreements voluntarily entered into and registered, dealing with all industries where wage-earners are organized in unions. The act is constantly invoked and is accepted by both capital and labor, though with occasional complaints. Its practical results have been so far the disappearance of labor conflicts, the stamping out of sweating, a general improvement of the conditions of labor, coupled with a tendency to refuse to grant a large and sudden increase of pay.

Side by side with the Labor Laws an Old Age Pensions Act, passed in 1898 and amended

in 1905, and consolidated and amended in 1913, provides for the poor of both sexes, after the age of 65, a pension not exceeding \$130 a year. An applicant for a pension must be of good character, have lived 25 years in New Zealand, and have an income of less than \$300 a year. The joint income of a married couple in receipt of pensions must not exceed \$500. The pension diminishes by \$5 a year on each pound of private income above \$170 a year possessed by an applicant. Nor does it seem to have yet diminished national thrift.

In 1917 there were 19,697 pensions, representing an annual payment of \$2,402,795, the average pension being \$122. A widow's pension is also in force. In 1917 2,024 widows were in receipt of pensions which aggregated \$196,930.

Land and Land Taxing.—One of the avowed objects of the Democratic and Progressive political party formed in 1877 was to restrict the growth and reduce the extent of large landed estates, and multiply small farms and holdings. This rather than Land Nationalization was, and is, their policy. Before the year mentioned, land monopoly, allowed to grow almost unchecked, had locked up great areas of fertile land in almost unpopulated pastoral properties. As late as 1891, considerably more than half the Crown lands which had so far been alienated were shown to be held in this manner: 584 owners possessed 10,400,000 acres. The pastoral leases of the Crown were on a similar scale; for 13 leaseholders occupied 2,541,000 acres. A law advocated by Sir John McKenzie limited acquisitions of Crown land in freehold to one square mile of agricultural land. After 1891, the same statesman caused much of the public land to be leased at a quitrent for 999 years instead of being sold, reduced the average area of the pastoral leases, and in 1894 carried a law authorizing the State to compulsorily expropriate private owners at a price to be determined by arbitration. Under the terms of the law the state repurchased millions of acres. Of the properties so purchased, all but very few were bought by friendly treaty.

By a law of 1907 a lease of 66 years was substituted for the longer lease in the case of Crown lands and for 33 years in the case of settlement lands, with privilege of renewal for successive terms. The yearly rental is fixed at 5 per cent the cost price of the land. The freehold may not be purchased outright. The so-called settlement lands are rented at 4½ per cent. The transfer of lands is effected by means of local or district land boards.

The graduated land tax imposed in 1891 had for one of its objects the subdivision of the larger estates. In place of the tax hitherto levied—a property tax of one penny in the pound on the capital value,—landowners had thenceforth to pay the penny on the unimproved value only of their estates. All building, improvements and livestock were exempted. Small holdings were exempted up to the value of \$2,500. The tax, therefore, fell lightly on small or moderate-sized farms. On estates the unimproved value of which reached or exceeded \$25,000, a special tax was levied, graduated so as to press with severity on the greater properties. This tax mounts by eight steps from one-sixteenth of a penny on \$25,000, to a maxi-

sum of threepence in the pound on land holdings valued at \$1,050,000. For land tax purposes, mortgages are deducted when assessments are made; a penny in the pound is levied on them but the money lender, not the landowner, pays it. The effect of the deductions and exemptions allowed under the land tax is to relieve nearly four-fifths of the landowners of the country from the impost altogether.

Income and Other Taxes.—All incomes over \$1,500 a year, not derived from land, are subject to income tax. On incomes between \$1,500 and \$6,500 a year the tax is sixpence in the pound; above \$6,500 sixpence on the first \$5,000 and one shilling on the excess. Companies pay one shilling in the pound on all profits. Foreign companies pay only on profits made in New Zealand. The following table for the year 1917 shows how small a share of the total public revenue is drawn from direct taxes:

CHIEF SOURCES OF REVENUE

Customs.....	\$19,248,375
Railways.....	24,181,375
Stamps.....	17,572,965
Land tax.....	3,565,590
Income tax.....	21,310,630
Beer duty, marine, miscellaneous, etc.....	4,289,010
	\$90,167,945

In 1917 there were 30,230 income taxpayers and 35,859 land taxpayers.

Public Finance.—Public finance, important in all countries, has had an especially direct influence on the history of New Zealand, where it has molded and been affected by local circumstances and a policy of state-socialism. From the first the government has been a borrower, and has gradually run up a debt, mainly external, and in 1917 reaching \$649,180,525. It may be convenient to divide the financial story into four periods. In the first of these, the 30 years between 1840 and 1870, borrowing was mainly the result of exceptional necessities—pressing needs for funds to buy out the New Zealand Company, to buy lands for settlement from the aboriginal tribes and to pay the cost of wars with these owners of the soil. A few public works, including one considerable railway, were begun locally and taken over by the central authority.

After 30 years the country with less than a quarter of a million whites owed \$35,000,000. Then, incited by a bold and very able financier, Sir Julius Vogel, the citizens resolved to undertake the opening up of the islands on the lines of the development of a large unoccupied estate. Railways, telegraphs, roads and bridges were to be pushed on; more land was to be bought from the natives; immigrants were to be imported in large batches. To this end the treasury was to borrow money in London.

Millions were borrowed and spent and, in the main, well spent. By 1881 the white population rose to 501,000. But in 1879 a financial crisis due to falling prices, bad banking and a wild land speculation had smitten the country, and ended the second of the four periods. The resulting depression did not begin to pass away until 1895 and during the intervening years confidence in the policy of state borrowing and development weakened.

In 1895 the commercial cloud began to lift.

Prices of raw products were rallying. The settlement of the waste lands was increasing production. The effects of refrigeration in stimulating the export of butter, cheese and still more frozen meat was putting money into the farmers' pockets. The Progressive party determined to borrow, not only to continue public works, but to break up monopoly by land resumption and to cheapen money by lending money on mortgage to the middling and smaller farmers. In August 1895, then, a loan of \$7,500,000 was raised in London. And during subsequent years borrowing has gone on at an accelerated pace. To-day we have the spectacle of a heavily indebted government which nevertheless easily raises a large and growing revenue paid by a prosperous community without serious complaint or hardship. Trade and production advance rapidly, the wealth of the people has grown and a fiscal policy which might seem oppressive to the mass of consumers is lightly borne by a democracy which might lightly abolish it.

The explanation is, perhaps, to be found in the beneficial character of the purposes upon which the borrowed money has for many years been spent. It has not been wasted in wars or upon the up-keep of a court or any army. The country is certainly spending freely but the aims of the outlay are defensible, being expended on public works, purchase of native lands, farm loans, land improvements, etc.

In 1917 the principal sources of revenue, exclusive of sales and rents of land, were as follows: customs, \$19,248,375; railways, \$24,181,375; stamps, \$17,572,965; land tax, \$3,565,590; income tax, \$21,310,630; beer, marine and miscellaneous duties and fees, \$4,289,010; making a total revenue of \$90,167,945. In the same year the rents received from leasing pastoral runs, etc., amounted to \$1,508,790. Expenditures in 1917 aggregated \$70,293,850, comprising \$20,073,960 for public debt charges, \$7,625,530 for education, \$6,842,450 for posts and telegraphs and \$3,597,975 for constabulary and defense. From 1870 to 31 March 1917 the total expenditure out of the Public Works Fund amounted to \$334,842,340. The average taxation per head of the population, excluding Maoris, reached \$47 in 1917.

Banks and Savings Banks.—The government has a substantial interest in the Bank of New Zealand, the chief chartered joint-stock bank. The government holds a large sum in preference shares of the institution and has guaranteed its debenture stock. In return the government appoints the auditor, four out of the six bank directors and a president with a veto. The bank, which was in desperate straits when, in 1893, the Treasury intervened to rescue it, is now prospering, and its ordinary shares which, in 1894, could not be given away, are now quoted at a high price. The two wholly New Zealand banking institutions have a paid-up capital of \$12,500,000, while the Bank of New Zealand has \$2,649,940 of 4 per cent guaranteed stock. In December 1917 the value of notes in circulation was \$32,323,470. Gold has almost disappeared from circulation. A public trustee dispenses with the private trust company; land registration offices offer loans on real estate, thus competing with private banks. Savings are also attracted to the gov-

ernmental insurance plan and building and loan associations flourish.

The six banks of issue which transact the ordinary banking business are branches of Australian houses, except two which are New Zealand companies.

YEAR	Deposits	Assets	Liabilities
1857.....	£343,316	£419,860	£432,404
1880.....	8,538,935	14,220,275	9,550,177
1900.....	15,570,610	17,314,535	16,964,582
1904.....	19,074,960	20,893,096	20,643,359
1908.....	21,821,753	29,098,567	23,311,903
1916.....	37,757,917	37,015,486	41,977,619

Most of the savings bank deposits are made in the public post office savings bank, which has 786 offices and held \$140,078,370 to credit of its 619,972 depositors in 1916. The five private savings banks hold on deposit about \$8,950,000 for 75,000 depositors.

The government money-lending on mortgage to farmers and others is managed by the advance to settlers office established in 1894. The legislation has been amended at different times and is now embodied in the State Advances Act of 1913, which authorizes the borrowing of moneys for the purpose of lending to settlers, workers and local authorities. Each year there may be borrowed for advances to settlers \$7,500,000, to workers \$3,750,000 and to local authorities \$5,000,000. From the inception of the scheme in 1894, 61,097 applications for loans aggregating \$124,567,465 have been received. The Advances Board authorized loans of \$86,794,150 to 46,954 applicants, the total actual payments to 31 March 1917 being \$84,725,050, of which \$44,545,980 has been repaid in respect of principal. Consult 'New Zealand Official Year Book,' issues of 1914 et seq. Most of the money has been loaned on rural freehold. The rate of interest charged is 5 per cent *plus* 1 per cent sinking fund applied to pay off the principal. The debt is thus automatically extinguished by 73 half-yearly payments. The legal and other charges of the office are very low. Up to the present time the office has suffered no losses, and there are virtually no arrears of interest owing to it, while it has already accumulated a reserve fund of \$250,000.

Education and the Educational System.—The first generation of settlers labored persistently to set up local schools. It was not, however, until 1877 that a national scheme of education available for all children alike, white and Maori, was established by the General Assembly. On the whole the measure of success gained by the friends of education has been high. New Zealanders may point to a university, to many secondary schools and to a really complete and efficient system of primary teaching. With the 20th century a creditable

advance has been made in manual and technical class-work. The training of teachers, too, receives fair attention. Industrial schools for criminal, destitute and neglected children have been successful in preventing the growth of any "larrikin" class. The government maintains a school for deaf-mutes, and an institute for the blind has been founded by private generosity. The bulk of the money for education is taken from the general taxes, though substantial rents are drawn from land reserves. The state spent \$7,625,530 for education in 1917. In the university and in secondary schools fees are charged. In the primary schools instruction is free in the six standards of the regular course; special and higher subjects are charged for. The primary system is secular, and attendance at some school is compulsory between the ages of seven and 14. The school attended may, however, be a private one, or a child may receive tuition at home. How seldom this privilege is abused is shown by the figures dealing with illiteracy among the population.

The average attendance at the primary public schools in the year 1916 was 163,156, and the number on the school-rolls at the end of the year 185,884. The percentage of attendance throughout the year was the very creditable proportion of 89.1. During the same year no less than 5,132 Maori or half-caste children attended school, a high number when it is remembered that the whole colored population amounts to but 49,776. The private primary schools, of which two-thirds belong to the Roman Catholic Church, instruct 23,635 pupils. In round numbers 214,651 New Zealand children get elementary schooling. This means in the government schools a good deal more than the three R's. It includes history, geography, vocal music, drawing and elementary science. Boys are drilled and girls taught needlework. Military instruction is given to several thousand cadets. No religious teaching of any kind may be given within school hours, though the attachment of the great bulk of the people to Christianity is shown by the muster-roll of the Sunday schools.

There are 2,355 elementary public schools occupying 5,781 teachers.

The proportion of women teachers is much lower than in the United States. About half the colored school children go to special village schools provided for the Maori race. The others attend the ordinary public schools where they consort on equal terms with white children.

The Minister of Education is the head of a central department, entrusted with the general supervision, financing and protection of the national system and the direct management of the Maori schools, industrial schools and the schools for deaf-mutes. The ordinary public elementary schools are administered by provincial boards of education elected by school committees of parents and guardians. Of these committees there were 1,300 in existence in 1917. The boards and committees appoint teachers in conjunction.

The industrial school children number 3,284. Of these about one-third live in the government reformatory schools; about one-third are boarded out; about another third are handed over to the authorities of Roman Catholic schools carried on under government inspection.

tion. A peculiarity of the New Zealand industrial school system is that the state remains *in loco parentis* to all its pupils until they are 21 years of age.

Secondary schools are of two divisions—60 district high schools controlled by the boards of education, with 2,115 pupils in 1917, and 37 endowed schools (sometimes clerical), managed by governors of their own, but inspected by the Department of Education. Altogether 7,052 children were in receipt of secondary education in 1917 and more than two-thirds of them receive it free. Technical high schools had 2,105 pupils in 1916.

The University of New Zealand is an examining, not a teaching body. It is controlled by a senate of 24 members. Four local colleges affiliated to it do teaching work, but students may obtain degrees without keeping terms at any of these. None of the colleges are residential. In 1916 2,108 undergraduates were keeping term. The number of degrees granted since the foundation of the university in 1870 was about 4,100 at the end of 1916. Degrees are granted to women and men indifferently. Until lately, a feeling of ultra-respect for English scholarship and example has been noteworthy in the college methods, and the university confined its degrees to the five broad departments of arts, science, medicine, law and music. In 1904, however, further powers were by statute given it to confer the degrees of bachelor, master and doctor of (a) veterinary science, (b) dental surgery, (c) engineering (mechanical, electrical, civil, mining, metallurgical, naval architecture), (d) agriculture, (e) public health, (f) commerce.

In response to local demands the central department has expended funds in equipping and maintaining classes for manual and technical instruction, and even go to the length of erecting special school buildings. Sometimes the education authorities control them, sometimes they are the outcome of voluntary association. Several schools of mining (notably one at Otago University College) attract about 300 students in all. Canterbury College supports a school of engineering attended by 200 students, and a college and farm for teaching agriculture with resident students.

Government and History.—The constitution bears a general likeness to that in force in the colonies of Cape Colony, Newfoundland and Natal. It is in the main founded on an act of the British Parliament of the year 1852, but the form then drawn up has been more than once amended by the citizens. The governor (governor-general since June 1917), is appointed by the king in council, and usually holds office for five years. He receives \$25,000 a year and \$10,000 additional allowances, and is vested with legislative power together with the General Assembly. He summons, prorogues and may, however, dissolve Parliament or refuse to do so. In practice, his master is the Secretary for the Colonies in the British Cabinet, who may recall him. All acts of the legislature require the governor's assent, which he

may withhold pending a reference to his superiors in London. Acts relating to currency, foreign immigration, ocean-going trade and constitutional amendments are so referred. The governor-general is commander-in-chief of the forces in New Zealand.

The Parliament, the General Assembly, is bicameral, consisting of a Legislative Council and a House of Representatives. The members of the first-named have hitherto been appointed by the governor for terms of seven years. Two of them are Maori chiefs. Formerly the Legislative Council was supposed to represent property and conservatism. Now, however, it is little more than a somewhat less energetic replica of the popular chamber, whose will it seldom thwarts. At present the Legislative Council consists of 24 members, who receive \$1,000 per annum. Those appointed before 17 Sept. 1891 are life members, those later hold office for seven years only. Provision has been made for an elective legislative council, the first election to be held at the same time as the first general election of members of the House of Representatives, after 1 Jan. 1920. Twenty-four members are to be elected at the first election and 40 at subsequent elections. Three Maori chiefs may be appointed by the governor-general.

The House of Representatives consists of 80 members, including four Maori chiefs. All are returned by single-member constituencies for the term of three years. The elections of the white members are all held on the same day. All adults,—of both sexes—who have resided a year in the colony and one month in an electoral district may register and vote for one candidate. Any duly qualified male elector may himself become a candidate. Members are paid \$1,500 a year, subject to deduction for absence without leave while the House is sitting. Their procedure is based upon that of the House of Commons, but the length of speeches is restricted by a time-limit, though there is no ‘closure’ of debates. The Maori members address the House in their own language, using an interpreter.

Twelve salaried ministers comprise the Executive Council. They may hold office as long as they possess the confidence of the House of Representatives, and in practice all important legislation is initiated by them. Roughly speaking, the English two-party system has been copied and for many years a Progressive and a Conservative party have disputed the ground. Party machinery, however, is neither elaborate nor all-powerful. The funds that sustain it are small and electioneering is cheap and singularly free from corruption. The secrecy of the ballot is absolute. The expenses of many successful candidates do not exceed \$250 apiece. By order in council of 9 Sept. 1907, and by Proclamation, the Colony of New Zealand was designated the Dominion of New Zealand on and from 26 Sept. 1907. The form of government at present obtaining was established by statute 15 and 16 Victoria, chapter 72, passed in 1852. The colony was divided into six provinces, later increased to 10, but afterwards reduced to nine. This provincial system was abolished in 1875 and governing power was transferred from the provincial officers to the governor and local boards. The proportion of voters to population is extraordinary as the fol-

following table—which deals with white electors only—shows:

Date of general election	Estimated total adult persons	Number on rolls	Proportion of adult persons registered as electors	Number of persons who voted	Proportion of persons on rolls who voted
1893.....	310,010	302,997	94.98	220,082	*75.25
1896.....	356,658	339,230	95.11	258,254	76.13
1899.....	386,146	373,744	96.79	279,330	*77.59
1902.....	429,385	415,789	96.83	318,859	76.69
1908.....	539,950	537,003	99.64	428,648	79.82

* Excluding figures for three electorates in which there was no contest.

† Including 4,974 informal votes.

At the elections of 1914 616,043 (335,697 men and 280,346 women) electors on the rolls, who returned 76 European members to the House of Representatives. At the same election 18,621 natives returned four Maori members to the same house.

Women obtained the franchise in 1893, and, as will be seen from the subjoined figures, make use of it almost as freely as men; though they are still ineligible as candidates. An experience of over a quarter of a century has shown, by general admission, that female suffrage has done no social or political harm whatever but has resulted in much general good to the whole community. On the whole, beyond listening to speeches and recording their votes, they take less open and active part in politics than was anticipated. They do comparatively little platform speaking. Certainly their vote has not changed the balance of parties. They have, however, strengthened the anti-liquor movement and have stimulated sympathetic reforms touching children and their own sex:

THE WORKING OF WOMEN'S FRANCHISE.

Date of general election	Estimated total adult females	Number of women on rolls	Proportion of adult females registered as electors	Number who voted	Proportion of females on rolls who voted
1893.....	139,471	109,461	78.48	90,290	*85.18
1896.....	159,656	142,305	89.13	108,783	76.44
1899.....	171,373	163,215	95.24	119,550	*75.70

1908.....	243,504	242,930	99.76	190,114	78.26
1914.....	290,000	280,346	97.10		

* Excluding figures for three electorates in which there was no contest.

† Including informal.

Local Government.—Local government is marked by a subdivision of functions resulting in a large number of directly or indirectly elected boards and councils.

In addition to the boards and committees of education, and to hospital and charitable aid boards dealing with sickness and indigence, the country contains local units, such as boroughs, town districts, counties, road districts, harbor boards, drainage districts.

The local franchise is not quite so simply and sweepingly democratic as the parliamentary. In the municipalities mere residence does

indeed confer the right to vote, but not on any question relating to loans or rates. The revenue of the local bodies comes mainly from rates, license-fees, harbor-dues and rents from land-reserves and in 1916 amounted to over \$11,000,000 from rates and \$27,000,000 from other sources. The larger municipalities are beginning to bestir themselves in providing locomotion, lighting, water and other improvements. Generally localities have shown themselves less enterprising than the central government in social and industrial experiments.

Charities and Corrections.—For relief purposes New Zealand is divided into districts, with elective boards in charge of the administration of public hospitals and charities. The state subsidizes charity bequests at the rate of 50 per cent; voluntary contributions at the rate of 120 per cent, and contributions by local authorities according to a sliding scale, ranging from 60 to 120 per cent, according to the value of ratable property in such local district. In 1916 the total expenditure on charitable aid aggregated \$623,090. In the same year 4,379 persons were accommodated in benevolent and orphan asylums, of whom 2,677 were remaining at such institutions at the end of the year. The state maintained 3,284 children (1,970 boys and 1,314 girls) wholly or partly in industrial schools and other establishments. Every person, not an alien or an Asiatic, who has attained 65 years of age and has resided in New Zealand for 25 years, and is of good character, is entitled to a pension of \$130 per year. A widows' pension is also paid to over 2,000 qualified under the terms of the act.

Within the state are eight Supreme Court judges and 31 stipendiary magistrates. There are several justices of the peace and magistrates' courts. On 31 Dec. 1916 the prisons contained 890 prisoners and during the year ending that day 34,196 Europeans were summarily convicted and there were 373 convictions of Europeans before the Supreme Courts.

History.—The islands were discovered by a Dutch sea-captain, from Batavia, Abel Jansen Tasman, who chanced upon them in 1642, but did not land. Captain Cook was the next recorded comer. He visited the group in 1769 and thrice subsequently, sailing round both islands, mapping them out and describing the shores and the natives. Thereafter came French navigators, American whalers, South Sea traders, beachcombers, runaway convicts from Australia, and, at last, in 1814, missionaries from New South Wales headed by Samuel Marsden. But, although Australia lay under the British flag, the English government refused or hesitated for about 60 years after Cook's voyage of discovery to annex New Zealand. Partly this was due to ignorance of its value, partly to disinclination to interfere with its warlike and intelligent natives whose numbers had been greatly overestimated by Cook, and whose ferocity and cannibalism made them a name of fear wherever the tales of south Pacific mariners were repeated. See MAORIS.

The Maori of New Zealand are a branch of the Polynesian race found in Hawaii, Samoa and other Pacific groups eastward of Fiji. They are well-built, brown-skinned, pleasant-looking, courteous in bearing and speech. They probably reached New Zealand in the 14th cen-

ture, sailing in double-canoes. When discovered by Europeans they were divided into a number of small tribes, often at war, and as late as 1770 were neolithic men, using weapons and tools of polished stone and knowing neither pottery nor metal-working. Their artistic qualities found expression in wood-carving, weaving and dyeing. They did not even employ bows-and-arrows, and in war fought chiefly hand-to-hand with spears and clubs. On the other hand their stockade-building was skilful and their larger huts evinced some advance toward architecture. They were expert gardeners and, in the absence of quadrupeds, clung to the sea-coast, the river-sides, and to lakes and forests where they could find fish and birds in abundance. Their tribal system was based on modified communism. Chiefs and priests controlled them, sustained by the terrors of tabu. Their mythology, many of their legends and some of their folklore show much poetry and imaginative power. Why they never became numerous is not very clear. Probably their tribal wars, infanticide and sexual immorality helped to keep them down. Probably also their tropical origin unfitted them to cope with the cold winds and frosts of a temperate climate.

Almost coincidently with the coming of the missionaries, the Maori began to obtain muskets and gunpowder for use in inter-tribal struggles, with the result that about one-fourth of them were exterminated in 20 years. Then the fighting died down, and between 1830 and 1840 large numbers were converted to Christianity. Unfortunately white land-grabbers began bargaining for tracts of country, making preposterous claims. Finally two colonizing companies, French and English respectively, resolved to plant settlers in the islands. The English company organized by Gibbon Wakefield was the first in the field, its emigrants reaching Wellington in January 1840. Their departure from England forced the hand of the British authorities who despatched a man-of-war, under Captain Hobson, to annex the country. Hobson hoisted the Union Jack on 22 Jan. 1840, and, at Waitangi, concluded a treaty with the natives by which their lands were guaranteed them and they accepted British rule. He chose Auckland as his seat of government. Meanwhile Gibbon Wakefield's company planted settlers at Wellington, Nelson, Wanganui, and New Plymouth in the region adjacent to Cook's Straits, only to find their land-purchases disallowed by the British officials. Ruin overtook them; disputes broke out with the natives, and in the far north at the Bay of Islands the English officials blundered into a war which proved the fine fighting qualities of the Maori. A strong governor, Sir George Grey, restored order, conciliated the Maori, bought land and enabled settlement to make headway. Gibbon Wakefield, undaunted by his first difficulties, founded the settlements of Otago (1846) and Canterbury (1850) in the southeast where there was no native opposition. In 1853 England gave the colonists self-government and in 1856 the first executive responsible to the local Parliament took the reins.

For the next 20 years the working of the constitution was complicated by the existence of local provincial councils with large powers

in each of the scattered settlements. Their jealousies and conflicts with the central authority were only brought to an end by their abolition in November 1876. They represented a peculiarity in the organism of the country which is even now noticeable. Settled from many points, the country has, even now, no one preponderating city. The jealousies and rivalries of a score of districts still worry governments and amuse travelers from other lands.

Within five years of the grant of responsible executives the colonists found themselves at war with the natives—first with one league of tribes, then with another. English troops, to the number of 10,000, were brought in; but the Maori were not always worsted: the fighting dragged on intermittently for 11 years, to be finally ended by the colonial militia and friendly natives, after the British red-coats had been withdrawn. The colonists found themselves left with a war debt of more than \$12,500,000, while from 1860 to 1871 the North Island made little progress. Taught by this hard lesson, they allowed an able minister, Sir Donald McLean, to pursue a conciliatory policy. Parliamentary representation was given to the Maori, and schools to their children; their land titles were scrupulously respected; while roads were pushed through the interior and rifles kept out of it. Serious disturbances were gradually made impossible.

Meanwhile the South Island was making rapid progress. Early in the 50's enterprising Australian sheep-owners discovered that the eastern moiety made excellent grazing country, and it was soon parceled out into "runs" or ranches. Then, in 1861, alluvial gold in abundance was found at Tuapeka, in Otago, and soon afterward in Westland. Diggers rushed in by tens of thousands. Agriculture began to spread, and by 1875,—aided by the introduction of the reaper and binder and other farm machines and tools from the United States,—it showed a promise of expansion which has hardly yet been redeemed. After 1872 the North Island began to move forward, encouraged by peace and the making of railways, roads and bridges. The burning off of the fern and clearing of the forest began to make way for sheep and cattle.

Up to 1877 public affairs were controlled by the employing, landowning and professional classes and by a few large financial institutions. The franchise was limited. Even the smaller farmers were overshadowed if not overawed. The native wars, the provincial divisions, the all-absorbing work of pioneering delayed the formation of any definite party of democracy. The expenditure of millions of borrowed money on public works also absorbed attention after 1871. In 1877, however, the inevitable development came about, hastened by the appearance of a leader of eloquence and prestige in Sir George Grey, formerly governor. Supported by two lieutenants of greater practical parliamentary talent than himself, Robert Stout and John Ballance, Grey succeeded in forcing on manhood suffrage and triennial parliaments, while his party recast the public education system, making it national, free, secular and compulsory.

Industrial depression which overtook the colony during Grey's premiership in 1879 discredited progressive politics for a while. The

farmers, dreading a land-tax, rallied round the more conservative leadership of Sir John Hall and Sir Harry Atkinson. For the next 11 years the story of New Zealand is largely a tale of efforts to find industries more profitable than the growing of wool and wheat—efforts which had their outcome first in frozen meat factories, later on in co-operative dairies. Coal mines were opened with success and two valuable natural monopolies—hemp (*phormium tenax*) and kauri gum—were exploited. The Parliament cut down public expenditure and reduced borrowing for some years. Labor, now armed with voting power, felt the pinch of depression. Wages fell, the unemployed clamored, tramps abounded. Trade unions began to organize, and socialistic writings to be studied. The small farmers and their sons cried out upon land monopoly and high rates of interest. In 1890 a labor conflict, the maritime strike, showed the trade unions,—who were badly beaten therein,—the desirability of making Parliament their battle-ground and of allying themselves with Ballance and the Democrats. At the elections of December 1890 the allied forces swept the polls, and the Liberal or Progressive party, then returned to power, continued to govern the country without a break for almost a generation.

The subsequent years have been marked by a series of bold political and social experiments. These have been latterly so far justified that since 1895 New Zealand has regained and enjoyed a remarkable degree of prosperity, while to a large extent its inhabitants seem reconciled to most of the novel enactments. Ballance died in 1893, but his successor, Richard Seddon, a man of robust temper, extraordinary energy and great natural shrewdness, gained a popularity and influence which seemed quite undiminished at the time of his sudden death in June 1906.

During the Boer War in South Africa public attention was to some extent diverted from local politics, for New Zealanders hotly espoused the mother country's cause and despatched 6,000 mounted riflemen, volunteers, to fight therein. But otherwise colonists have divided their attention not unequally between politics and prosperity. No leader of striking power had come forward to challenge the Progressives, whose majority in Parliament had risen to about three to one at the moment of Seddon's death. The dominant party, however, has experienced a sensible internal change. Labor has less influence, and the farmers more, than was thought to be the case between 1890 and 1896.

Elementary military training for boys between 12 and 18 was made compulsory in 1910. Compulsory training on stated dates is the rule for those between 18 and 21. In the Great War of 1914-18, New Zealand benefited by this preparation. Before the end of August 1914 a New Zealand force, in conjunction with vessels of the British and Australian navies, took possession of German Samoa. An expeditionary force of infantry, mounted infantry and artillery, with all necessary details was also dispatched to take part in the war in Europe. After training in Egypt, during which a portion of the force took part in the first fight for the Suez Canal, the New Zealand troops assisted in the landing and subsequent fighting on Galli-

poli, being eventually transferred to the western front. Until the close of 1916 the reinforcements were maintained entirely by voluntary enlistment. It was then deemed advisable to provide for compulsory military service, which was done by the Military Service Act of 1 Aug. 1916, by the terms of which men between 20 and 46 years of age were obligated to render military service. For details of this act consult 'New Zealand Year Book' (1917). Over 75,000 were called to the colors in the ensuing year.

The combination of small landholders and labor classes which for nearly a generation kept the Laborites in the saddle appears to be breaking up, especially since 1912. The landholders are becoming conservative as they acquire greater wealth and appear inclined to throw over those who helped them win it. The labor classes are also dissatisfied, believing that their efforts to better their condition are rendered futile by the compulsory arbitration system now in force. The machinery of the latter appears to have passed to the possession of the great manufacturers, who now loudly proclaim their faith in arbitration which in days gone by they fought as only dogs at bay can fight.

Few New Zealand men have made any name for themselves outside the narrow limits of their own shores. Gibbon Wakefield, the founder of the colony, played a conspicuous part in shaping England's colonial policy between 1830 and 1856. He finally settled in New Zealand and was a member of the first House of Representatives, but owing to failing health never distinguished himself in the young community. Sir George Grey (1812-98) spent nearly 40 years in New Zealand and left a lasting mark on its institutions. A man of literary tastes, he compiled a valuable collection of Maori legends. His services in South Australia and South Africa and the curious contrasts of his career in New Zealand—where he played in turn the parts of absolute ruler and leader of the people—made this eloquent, brave and refined figure the most interesting in the story of New Zealand. In marked contrast to him stands out the more boisterous but strong, bold and successful personality of Richard Seddon (1844-1906), a Lancashire mechanic, who entered New Zealand politics in 1879, became Minister of Public Works in 1891, and grasped the Premiership in 1893. Seddon will be remembered in New Zealand, not only for the notable experimental legislation passed during his long term of office and the general prosperity enjoyed, but as the personification of restless energy, bluff, popular geniality and a devotion to political business control and management, which undoubtedly wore him out and killed him.

Amongst other New Zealand public men the names of Atkinson, Fox, McKenzie, McLean, Ballance and Stout are the most prominent. Fox, who was more than once Premier, wrote a good history of the fighting with the native tribes in the years 1826-66. Alfred Domett, another Premier, was the literary friend called "Waring" by Robert Browning, and himself wrote a narrative poem 'Ranolf and Amohia,' of no mean merit. The best book in prose yet written by a New Zealander is, beyond question, the 'Old New Zealand' of F. E. Maning,

a delightful and accurate study of life among the Maori tribes before annexation.

NEW ZEALAND FLAX. See FIBRE.

NEWARK, nū'ark, Del., town in Newcastle County, on the Philadelphia, Baltimore and Washington, and the Baltimore and Ohio railroads, about 11 miles south of Wilmington. It is in a section of the State noted for its productiveness. The chief manufactures are paper, machinery, fibre, acids and canned goods. There is considerable trade in the manufactured articles, fruit and vegetables. It is the seat of the State College, opened in 1833. The town owns and operates the electric-light plant and the waterworks. Pop. 2,800.

NEWARK, N. J., city, county-seat of Essex County, metropolis of the State, in lat. 40° 41' N., long. 74° 10' W.; on the Passaic River and Newark Bay, eight miles by rail from New York City and within the direct zone of the business influence and activities of the nation's metropolis. In 1920 it ranked 11th in manufacturing and 15th in population among the cities of the United States. It has an area of 23.40 square miles, of which 6.48 square miles were until recently meadow land lying in the southern and southeastern section. The wharf frontage on the river and bay is 10½ miles; the width of the channel is 300 feet; depth at mean low water, 20 feet and at high water, 25 feet.

Port Newark Terminal.—In 1908 the city undertook the reclamation of its meadow land, but it was not until 1914, after the creation of the municipal department of docks and meadows, that substantial results began to appear. The area of the meadow development zone was 1,150 acres, and in a little over a year an area had been reclaimed aggregating 294 acres, of which 124 acres were reserved for new streets, freight yards, stations and dock frontage, and 170 acres were set apart for leasing for manufacturing and commercial purposes. The authorized bond issues for the development, up to 1 Oct. 1915, totaled \$2,250,006, and the disbursements and balances due on contracts, \$2,013,608. After the United States had been forced into the World War, this section was deemed of such vital importance to the National government that the latter bought and leased large portions of the reclaimed area, and in 1917 established there a great submarine-boat construction plant and an extensive reservation for the needs of the quartermaster's department of the army. These and other national acquisitions early in 1918 transformed a large part of the former useless salt meadow land into a bustling suburb and gave the city an additional industrial population of over 100,000.

Manufactures.—The city has the distinction of ranking first in the Union in the value of its manufactures and the diversity of its industries, according to its per capita population. It has 252 distinct lines of industry, 50 lines turning out values from one to \$30,000,000 annually. It is the largest fine jewelry manufacturing centre in the United States; produces the largest variety of leather for shoes, carriages and upholsterings; is the home of the mother-of-pearl button and novelty industry; produced the first malleable iron in America; built the first locomotive engine to travel up grade; made the first patent leather in the country and gave celluloid and its products to the world. In 1915 the city had 2,294 manufacturing establishments using power and employing over 10 persons, with an invested capital of \$225,640,600, employing 82,439 operatives; using material valued at \$130,299,000 and having an output valued at \$250,654,527. The leading industries, according to the value of the finished products exceeding \$5,000,000 were smelting and refining of metals, \$35,000,000; leather, tanned, curried and finished, \$20,118,000; foundry and machine shop products, \$15,403,000; malt liquors, \$12,072,000; jewelry, \$11,215,000; electrical machinery and apparatus, \$8,920,000; paints, oils and varnishes, \$7,761,000, and chemicals, \$6,077,000.

Transportation and Commerce.—The following trunk line railroads connect the city with all parts of the country: Pennsylvania, Lackawanna, Lehigh Valley, Erie and Reading (Central of New Jersey). Electric railways comprise the Hudson and Manhattan Tubes systems, and trolley lines extend to all important points in the State. Daily trunk line passenger trains to and from the city average 882; freight trains, 101; annual railway tonnage received, 2,366,350; shipped, 1,157,876; cars of merchandise freight received and shipped annually, 335,467; passenger stations, 14; freight delivery yards, 23; daily electric railway trains to and from New York, 233; time between the two cities, 18 minutes. The large number of local trains which connect with the New York ferries and the cities on the Hudson give Newark the advantage of the ocean steamer traffic. The Passaic River entering the Newark Bay furnishes the city a most important direct water route to the ocean.

Buildings and Municipal Improvements.—The number of public buildings in the city is 141; value of municipal property, \$73,468,507; principal public buildings: United States Government Building, Essex County Courthouse (cost \$1,750,000), City Hall (\$1,500,000), Free Public Library (\$350,000) and the public schools. The city is widely noted for the excellence of its water supply, having its source in the Pequannock River and delivered on the gravity system. The daily capacity of the watershed is 50,000,000 gallons and the average daily consumption, 46,500,000 gallons. There are eight storage and distributing reservoirs, with a storage capacity of 9,825,700,000 gallons. Newark has 260 miles of paved and 62 miles of unpaved streets; 309.19 miles of sewers; 5,575 gas and electric street lights; 20 city parks with gross area of about 20 acres; 5 county parks within the city of about 642 acres; city parkways of eight and one-half acres and a seashore camp of 11½ acres at Avon-by-the-Sea for deserving children during summer seasons. The police department, with 794 men, cost annually \$1,083,200 and the fire department, with 472 men, costs annually \$720,080. Recent municipal improvements also include Port Newark Terminal, previously noted.

Churches and Charitable Institutions.—Newark has a total of 181 churches divided denominationally as follows: Presbyterian, 34; Roman Catholic, 32; Baptist, 25; Methodist Episcopal, 18; Protestant Episcopal, 17; Jewish, 11; Lutheran, 10; Reformed Dutch, 8; Congregational, 3; Science, 2; Universalist, 1; miscellaneous bodies, 23. Its benevolent activities are promoted by 62 charitable organizations and in institutional work there are 12 hospitals, 5 orphan asylums and a large number of specialized centres.

Social Welfare.—There are over 700 regularly organized societies engaged in all manner of social service, besides a very large number of patriotic units rendering most efficient service for the Newark soldiers and sailors in the World War. Strictly social clubs exceed 100 in number; building and loan associations, 256; improvement associations, 13, and savings and loan associations, 9.

Educational Interests.—Public school property has an estimated value of over \$10-

720,000. There are 67 public schools of the different grades, with over 2,000 teachers and 73,000 pupils; cost of maintenance (1916), \$3,219,288; 52 private and parish schools with an estimated enrolment of 25,000; 4 public high schools, 8 business colleges, 2 academies and 7 technical, drawing, law, industrial and normal schools. The Free Public Library cost for building, equipment, etc., \$1,064,000, has over 245,000 volumes, circulates annually some 1,125,000 volumes and is maintained at an annual gross cost of approximately \$150,500. An attractive Art Museum is maintained in the library building and in the library proper popular exhibitions are frequently given. Other libraries are the Prudential Insurance Company's Law and Medical Library and the library of the Lawyers' Club. The New Jersey Historical Society has a collection of books, manuscripts, paintings and other articles of great historical value. In 1918 the United States Shipping Board organized a school of marine engineering here, and in 1919 the principal technical school was raised to the dignity of the Co-Industrial College of Technology.

Banking and Insurance.—Under the National Banking Act of 1913, Newark is included in Federal Reserve District No. 2, of which New York City is the central reserve city. In 1917 there were 9 national banks, 11 trust companies, 5 savings institutions and 13 savings departments in national banks and trust companies. National banks had combined resources of \$76,954,256 and deposits of \$57,683,620; trust companies, resources of \$50,915,242 and deposits of \$39,463,402; savings banks, resources of \$50,568,925 and deposits of \$47,244,972. Building and loan associations had assets of \$63,978,185, receipts of \$36,980,243 and shareholders, 94,254. Two of the largest life insurance companies in the United States, the Prudential and the Mutual Benefit, have their home in Newark. Together they reported assets of \$636,582,170, income \$159,714,502, disbursements \$104,252,855. There were five fire insurance companies with \$3,950,000 combined capital, \$23,769,711 assets, \$12,300,924 income, \$10,789,234 disbursements and \$5,025,491 fire losses paid in 1916.

Vital Statistics.—In 1917 there were reported 43,769 dwellings and 18,298 factories and commercial buildings in the city. The very large type of apartment houses dotted the city thickly in all of its strictly residential sections and was even encroaching on bustling business thoroughfares. In 1918 the city faced a serious housing problem because of the great influx of workmen at Port Newark Terminal and also at many of the large industrial plants on account of the unprecedented demands of the World War. The number of births (1916) was 11,446; rate per 1,000, 29.7; death rate per 1,000, 16.5.

Finances.—The assessed valuation of all taxable real estate and personal property in 1916 was \$420,311,342; value of all municipal property, \$73,468,507; total bonded debt, \$42,961,200; aggregate of sinking funds applicable to bonded debt, \$11,650,082; total net debt, city and water, \$31,311,118; tax rate per \$1,000 of valuation, 24.50.

History.—Immediately following the English conquest of the New Netherlands, in 1664, a part of the Dutch possessions in North Amer-

ica, being practically what is now the State of New Jersey, was granted to Lord John Berkeley and Sir George Carteret. The settlement of northeastern New Jersey was immediately begun under a liberal form of government, a site near the mouth of the Passaic River proving attractive to certain Congregationalists, then settled in the colony of Connecticut. In May 1666, the New Englanders removed "their families, their beloved pastor, their church records and communion service, their deacons and their household goods" to the site of the future city of Newark. By 1685, Newark, in which the Congregationalists had settled, was a compact town of 500 inhabitants. The system of local government was like that of many early New England villages, being the limitation of political and religious activity, through the agency of the town meeting to those who professed Congregationalism.

The strong element of conservatism, characteristic of the settlement of Newark, remained unchanged until long after the opening of the 19th century. Religion and education were warmly supported, and for several years the College of New Jersey, now Princeton University, was located at Newark. The tidal waters of the Passaic River gave easy access to New York, the country-side supplying provisions and wood to the inhabitants of Manhattan Island. Newark was also engaged in a coastwise trade. To a degree the young community was somewhat isolated owing to the difficulty of road-building over the marshes and the ridge of rocks separating Newark from Paulus Hook, now Jersey City.

In the Revolutionary struggle Newark took an active part. As early as June 1774, her inhabitants protested against the Port Bill, and offered to become parties to a plan of union to redress grievances. In November of the same year inhabitants of Newark, as members of the Essex County grand jury, patriotically answered the charge of the loyalist chief justice; while in January 1775, the royal newspapers were boycotted by many of the inhabitants of the town. In the spring of that year some of the inhabitants declared that they were willing to risk their lives and fortunes for American liberty. The "gentlemen traders of this town" were recommended not to supply provisions to Canada and other loyal portions of North America. In March 1776, the Newark committee regulated the price of West India products, and traders were notified that defiance of regulation would cause the storekeeper to be declared an enemy to his country.

Newark was early identified with the efforts made to secure internal improvements, even before the second war with England. Turnpikes were extended in every direction, bringing the town in close communication with the north-western portion of the State, from which section Newark has largely drawn men who have become locally prominent. During the early years of the 19th century the first bank organized in New Jersey (1804) was established in Newark, while one of the chain of banks having the word "state" in their titles (1812) was located in this city. In 1824 the city was declared by legislative enactment to be the terminal of the Morris and Essex Canal, which was soon constructed, and united the waters of New

York Bay with those of the upper Delaware. During the early 30's the New Jersey Railroad was built between Jersey City and New Brunswick, which with Camden and Amboy connections placed Newark on the direct route between New York and Philadelphia. Following the construction of these lines, now a part of the Pennsylvania Railroad system, came railroads now forming parts of the Lackawanna and the Central Railroad of New Jersey systems, and more recently the extension of the Hudson and Manhattan tube service to the city. For five months in 1916 (May 1-Oct. 1) the city was in gala attire, celebrating the 250th anniversary of its founding. In 1917 the city adopted the commission form of government under five commissioners between whom in a like number of groups all former municipal departments were divided. In 1919 the United States Post Office Department selected a tract in the Forest Hill section of the city for a landing field for its aerial mail service. Pop. (1810) 8,008; (1830) 10,953; (1850) 38,894; (1860) 71,941; (1870) 105,050; (1880) 136,508; (1890) 181,830; (1900) 246,070; (1910) 347,460; (1920, Federal census) 414,524. Consult City records; Atkins, 'The History of Newark, N. J.'; 'Records of the Town of Newark, 1666-1836'; Dodd, H. P., 'Newark of Former Days and Newark of To-day' (1907); Urquhart, Frank J., 'A Short History of Newark' (1910, 1916); Newark Public Library. GEORGE J. HAGAR,
New Jersey Historical Society.

NEWARK, N. Y., village in Wayne County, on the Barge Canal, and on the West Shore, the New York Central and Pennsylvania railroads, about 176 miles west by north of Albany, and 30 miles east by south of Rochester. It was settled in 1820 by people from Rensselaer County in the eastern part of the State. It was incorporated as a village in 1825. It is in a fertile agricultural region, but the village has considerable manufacturing interests, including tinware works, paper box factories, a glass factory, canning and preserving factory and other establishments. Newark has a large trade in farm and dairy products, fruit and its manufactured articles. Its educational institutions are the Union Free School and Academy, the public elementary schools and the free public library. There are several churches and a number of church and literary charitable and educational societies. The State Custodial Asylum for Feeble-Minded Women is located here. The population consists of nearly all native-born Americans, over one-half of whom are of Dutch, German and Irish descent. The water-works are village property. Pop. 6,964.

NEWARK, Ohio, city, county-seat of Licking County, at the junction of three branches of the Licking River and on the Ohio Canal and the Baltimore and Ohio and the Pennsylvania railroads, about 30 miles east by north of Columbus, and within 14 miles of the centre of the State. It was settled in 1802 by a colony from the eastern part of the United States. Nearby are two large mounds which belong to the works of the "Mound Builders." It is in an agricultural region and in the vicinity are valuable deposits of sandstone, extensive

coal-fields and natural gas. The chief manufactures are glassware, chemical instruments, carriages, hardwood, bottles, electric cars, locomotives, machine shop products, rope, foundry products, flour and lumber products. There are about 160 manufacturing establishments in which there are 12,000 employees. The streets are well paved and well kept. The State encampment ground and the Auditorium, a fine theatre erected as a memorial to dead soldiers of the Civil War, are of much interest. There are 28 churches, a high school, public and parish elementary schools and a public library, established in 1877. The five banks have a combined capital of \$850,000, and the annual amount of business transacted is \$3,600,000. The government is administered under the charters in accordance with the Ohio State Municipal Code. The inhabitants are nearly all American born. Baltimore and Ohio Railroad Company has locomotive and rolling stock repair shops in Newark with more than 2,000 employees. The Wehrle Company operates the largest stove manufactory in the world with 2,500 employees. Newark is the seat of Dennison University with 700 students (coeducational). On its outskirts is Buckeye Lake, the largest inland pleasure resort in Ohio. This lake is nine miles long and from one to two miles in width. Pop. (1920) 26,718.

NEWARK SERIES, in geology, a term applied to that part of the Triassic system (q.v.) in eastern North America. Its limits are Nova Scotia on the north and South Carolina at the south. The typical deposits are near Newark, N. Y., whence the name is taken. The deposits in the series are conglomerates; breccias; thick red sandstones, which must have originated in crystalline waste, as is evident from the comparatively large amount of mica and the feldspaths; and basalt, which accompanies the sedimentary rocks and occurs in dikes and sheets, such that the violent volcanic character of their derivation is made certain. The fossils of the series are scarcely any of marine types, plants and foot-prints preponderating. The commercial value of the deposits of the Newark series is in the brown sandstone building stone of New Jersey and Connecticut, and the coal veins of North Carolina and Virginia.

NEWARK WORKS. See MOUND BUILDERS AND MOUNDS.

NEWBERRY, nŭ'bĕr-ĭ, John Strong, American geologist: b. Windsor, Conn., 22 Dec. 1822; d. New Haven, 7 Dec. 1892. His early life was passed chiefly in the Western Reserve, Ohio, and he was graduated at the Western Reserve College in 1846 and at the Cleveland Medical School in 1848. From 1851 to 1855 he practised medicine in Cleveland. He was assistant surgeon and geologist to the government expedition that explored the country between San Francisco and the Columbia River; also accompanied Lieutenant Ives in his exploration of the Colorado River, and the expedition under Captain Macomb in its exploration from the Santa Fé to the junction of the Grand and Green rivers. His reports upon the scientific results of these expeditions brought him great credit in the scientific world. At the beginning of the Civil War he became attached to the Sanitary Commission, and later secretary of its Western department. He was afterward

connected with the Smithsonian Institution, and with the Columbian (now George Washington) University, Washington, and in 1866 was appointed professor of geology and palæontology at the Columbia College School of Mines, which post he retained till his death. Besides many special reports and parts of general reports, his writings include: 'The Rock Oils of Ohio' (1859); 'Catalogue of the Plants of Ohio' (1860); 'Iron Resources of the United States' (1874); 'The Structure and Relations of Dinichthys' (1875); 'Palæozoic Fishes of North America' (1889); 'Later Extinct Floras' (1898); etc. He was especially conversant with the palæontology of the Carboniferous Era in America, and particularly with extinct fishes; and as a teacher he had great popularity and influence. He was among the early members of the National Academy of Sciences. The most interesting portions of the 'Report on the Colorado River of the West, Explored in 1857-58' (Washington 1861) were written by him and relate to the geology, physiography and Indians of that region. Consult the memoir by J. J. Stevenson in the *American Geologist* (Minneapolis, July 1893), and White, C. A., 'Biographical Memoir of John Strong Newberry' (Washington 1908).

NEWBERRY, Truman Handy, American naval commander and financier: b. Detroit, 5 Nov. 1864. He was graduated at Yale University in 1885 and entered the railroad business. His industry soon made him a prominent figure in business and financial enterprises of his State. Newberry was one of the organizers of the Michigan State Naval Brigade, serving as landsman (1895), lieutenant and navigator (1897-98). In the Spanish-American War he participated in the attack of the *Yosemite* on the Spanish munitions ship, *Antonio Lopez*. In 1899 he was appointed colonel and aide-de-camp to the governor of Michigan; and later became Assistant Secretary of the Navy (1905-08). On the retirement of Secretary Metcalfe, he was appointed Secretary of the Navy in the Cabinet of President Roosevelt, serving from December 1908 to March 1909. In the European War, Mr. Newberry was given the post of lieutenant-commander of the United States Naval Reserve. In 1918 he was elected to the United States Senate.

NEWBERRY, S. C., city, county-seat of Newberry County, on the Atlantic Coast Line and the Southern railroads, about 40 miles northwest of Columbia. It is in a region in which the cultivation of cotton is one of the chief industries. It has manufacturing establishments for cottonseed-oil, cotton goods, preparing cotton for shipment, coffins, fertilizers and lumber products. It has considerable trade, chiefly in cotton products, fruits and vegetables. It is the seat of Newberry Lutheran College and has a handsome city hall and courthouse. The electric-lighting plant and waterworks are civic property. A mayor and unicameral council elected every two years administer city affairs under a charter of 1894. Pop. 6,000.

NEWBERRY LIBRARY, Chicago, Ill., is a free library of reference established in 1887 and maintained by a moiety of the estate of Walter Loomis Newberry (1804-68), a pioneer merchant of Chicago. Since 1894 it has occupied a fine structure of Spanish-Romanesque

architecture built of Connecticut granite, situated on Walton place, between Dearborn avenue and North Clark street. The collection consists of over 375,000 books, pamphlets, manuscripts, etc., representative of the principal fields of knowledge and branches of learning which fall within its province; bibliography and the history of printing, religion and theology, philosophy, psychology and ethics, history, political science, geography, biography, language, literature and (in part) the fine arts. The original plans of the trustees contemplated the gathering of a general collection of reference and source books on all subjects. Later, however, a co-operative arrangement was entered into with the Chicago public and other libraries under which the field of knowledge was roughly divided among them, and a policy of non-duplication of books was adopted. In each of its divisions the library possesses many treasures, making it one of the most valuable book collections in the United States. Under the head of education, notably, teachers will find an excellent working collection of authoritative works on the past history of their profession and on its present condition, tendencies, methods, theory and practice. The majority of the books are, naturally, mainly intended for the use of professional scholars, but all classes of readers from the most learned investigator to the boy or girl seeking information for school use are welcomed.

NEWBURY, John, English publisher and bookseller: b. Waltham Saint Lawrence, Berkshire, 1713; d. London, 22 Dec. 1767. Going to London he began in 1745, in Saint Paul's Churchyard, the publishing and selling of books, which he combined with the sale of patent medicines. He also published *The Universal Chronicle and Weekly Gazette*, in which Johnson's 'Idlers' appeared, and *The Public Ledger*, in which Goldsmith's 'Citizen of the World' was printed. Newbery made a specialty of books for children, and published the 'Juvenile Library,' a choice collection of volumes, among which were 'Goody Two Shoes,' 'Tommy Trip and His Dog Jowler' and other surviving favorites. He was also publisher of the first religious periodical *The Christian Magazine*.

NEWBOLT, Sir Henry John, English author: b. Bilston, Staffordshire, 6 June 1862. He was educated at Clifton and Oxford and was called to the bar of Lincoln's Inn in 1887. After practising his profession till 1899 he established the next year the London *Monthly Review*, which he edited until 1904. He has published 'Taken from the Enemy' (1892); 'Mordred' (1895); 'Admirals All' (1897); 'The Island Race' (1897); 'Stories from Froissart' (1899); 'Froissart in Britain' (1900); 'The Sailing of the Long-Ships' (1902); 'Songs of the Sea' (1904); 'Songs of the Fleet' (1910); 'The Old Country' (1906); 'The New June' (1909); 'Songs of Memory and Hope' (1909); 'The Twymans' (1911); 'Poems New and Old' (1912); 'The Book of the Blue Sea' (1914); 'The Book of the Thin Red Line' (1915); 'History of the Oxfordshire and Buckinghamshire Light Infantry' (1915); 'Tales of the Great War' (1916); 'The Book of the Happy Warrior' (1917); 'A New Study of English Poetry' (1917). Certain of his patriotic poems, such as 'Admirals

All,' 'Playing the Game,' 'Drake's Hymn' and 'The Vigil,' have established his fame.

NEWBOLT, William Charles Edmund, English Anglican clergyman and author: b. Somerton, Somerset, 14 Aug. 1844. He was educated at Oxford, was vicar of Dymock 1870-77, and of Malvern Link 1877-88. He was principal of the Theological College, Ely, 1887-90, and is a canon and chancellor of Saint Paul's Cathedral. Among his published works are 'Counsels of Faith and Practice' (1883); 'The Fruit of the Spirit' (1888); 'The Prayer Book: its Voice and Teaching' (1889); 'Religion' (1889); 'The Dial of Prayer' (1901); 'Apostles of the Lord' (1901); 'Priestly Blemishes' (1902).

NEWBORN, a sect of Antinomians, which arose in the United States in the early part of the 18th century. Its founder was a German immigrant, named Mathias Bawmann (who died 1727). They held the doctrine of the deification of humanity by regeneration and that those who were regenerates were, like Christ, incapable of sin. They denied that the Bible was necessary for the illumination of Christians, and scoffed at the sacraments. They claimed that their regeneration or newbirth was brought about by dreams, apparitions and supernatural inspiration, and was like the new name written on the white stone and known only to him that receiveth it (Rev. ii, 17). The sect survived the death of its founder by about 20 years.

NEWBURGH, nū'berg, N. Y., city in Orange County, on the west bank of the Hudson River, and on the Erie and the West Shore railroads, 58 miles north of New York. The first settlement was made by emigrants from the Rhenish Palatinate, in the winter of 1708-09. They called the place, "Palatine Parish by Quassaic." The Germans were soon followed by emigrants from Great Britain, and in 1750 the English and Scotch were there in numbers sufficient to change the name to "Parish of Newburgh" in memory of Newburgh, in Aberdeen County, Scotland. Before the Revolution the farmers from the river brought their produce here to be sent to market. The lumber trade was most important; ships were built for trade with the West Indies and London; and at one time whaling was an industry of Newburgh. The city occupies a prominent place in the history of the Revolution. It was Washington's headquarters from March 1782 until 18 Aug. 1783. The "Hasbrouck House," which Washington occupied in Newburgh, was purchased in 1849 by the State of New York, and is now used as a museum for Revolutionary and Colonial relics. It is in charge of a board of trustees who have had it restored as when Washington occupied it. While in Newburgh, Washington received the letter (see NICOLA, LEWIS) asking him to become king; here the army was disbanded, and from here the Newburgh Addresses (q.v.) were issued. In 1800 Newburgh was incorporated as a village, the third in the State. After its incorporation the enterprising inhabitants built turnpikes to the farming sections west of the village, and in this way secured the trade of the farmers in the vicinity. Until 1830 sailing vessels plied regularly between New York and Newburgh, but after that date steamboats were used. The

opening of the Erie Canal diverted considerable trade from the village. The first general rowing regatta on the Hudson River was held here in 1837. Others followed in 1840, 1841 and 1842. The country around has many places of historical interest. (See NEW YORK). It was granted a city charter in 1865.

The city, viewed from the Hudson River, presents a pleasing arrangement of terraced slopes, broad, clean streets, many trees and beautiful buildings. It is about 310 feet above the river, or Newburgh Bay, as the river expansion here is called. It is in an agricultural region, the commercial centre of an extensive section and of a number of large industries. The chief manufactures are machine-shop products, plaster, cotton and woolen goods, felt hats, silk, leatherette, powder, paper, paper boxes, soap, ice machines, perfumes, furniture, springs, leather, carpets, flour, lumber, foundry products, dairy products, overalls and cigars. It has ship yards, extensive coal, brick and lumber yards. Large quantities of coal from Pennsylvania are brought here to be loaded in coasting vessels and barges. On the northeast corner of the grounds surrounding the "Headquarters" is the "Tower of Victory," made of stone, 53 feet high, with four archways leading into an atrium, and stairways leading into a belvedere. It contains a bronze statue of Washington, copied by O'Donovan from Houdon's model. Other statues represent the soldiers in the War of the Revolution. A tablet bears an inscription telling that the monument was erected by the authority of the Congress of the United States and of the State of New York. It cost \$67,000. The block of brownstone near the entrance marks the grave of Uzal Knapp, the last survivor of Washington's Life Guard; died in 1856. Newburgh has the first free public library in the State, a hospital, orphanage, county tuberculosis sanitarium and home for the friendless. Its educational institutions include several large public and parish schools (Roman Catholic), a free academy, Saint Patrick's Academy and Mount Saint Mary's Academy. There are 25 churches, one of them for colored people. The government is administered under Plan C of the Optional Charter Law of the State, which provides for a mayor and four councilmen, elected for four years. These five select a city manager who wields the executive power. The city owns and operates the waterworks. Pop. 30,366. Consult Ingersoll, 'Handy Guide to Hudson River'; Nutt, 'Newburgh: Her Institutions, Industries and Leading Citizens' (1891); Ruttenber, E. M., 'Town of Newburgh'; Powell, L. P., 'Historic Towns of the Middle States' (New York 1899).

NEWBURGH ADDRESSES, in *American history*, a term applied to two anonymous letters, appearing in 1783, after the close of the Revolution. They were written upon behalf of the American soldiers whose pay had been withheld. It was afterward made known that General John Armstrong was the author of the letters.

NEWBURGH SEDITION, in *American history*; while General Washington had his headquarters in Newburgh, on the Hudson, December 1782, great dissatisfaction manifested itself among his officers, and they addressed a memorial or "round robin" to Congress, de-

manding their back pay, and security for future services. Congress refused to grant the demands, and in the following March an attempt was made to inaugurate a revolt. The matter became so serious that Washington appeared before a meeting of the malcontents and delivered such a patriotic address that the spirit of insubordination immediately disappeared.

NEWBURYPORT, nü'būr-ī-pōrt, Mass., city and one of the county-seats of Essex County, on the Merrimac River, three miles from the sea, 35 miles northeast of Boston and on the Boston and Maine Railroad. It extends for about three miles along the bank of the river, but the streets leading back from the river are short; High street, the principal residence street, lies parallel with the river, and State street, the chief business street, is perpendicular to it. In the upper part of the city the river is crossed by a chain bridge (built 1792), the first suspension bridge in America. Among the notable buildings are the Putnam High School, the Anna Jacques Hospital, the Y. M. C. A. Memorial Building, the Old South Church, which contains the remains of George Whitfield, Marine Museum, Old Ladies' Home, and the public library, formerly the old Tracy mansion, where Washington and Lafayette were entertained; the library contains about 40,000 volumes. The house in which William Lloyd Garrison was born is also in the city. In the days of wooden sailing vessels, the chief industry of Newburyport was shipbuilding, and many of the most famous clipper ships were built there; some small vessels are still built. The harbor is good, but access to it difficult on account of the shifting sand bar at the mouth of the river; there is a considerable trade in coal brought to the city by coasting schooners. The more important industries now include boot and shoe factories, cotton factories, hat shops, an iron foundry, comb factory and a silver factory. The mayor, city council and board of aldermen are elected annually. The city owns and operates its waterworks, which were bought from a private company after considerable litigation. Newburyport was settled about 1635, separated from the town of Newbury in 1764, and chartered as a city in 1851. Theophilus Parsons made his home here and it is also the birthplace of Francis C. Lowell. It sent a large quota of troops to the Civil War, and many of its citizens, who were sea-captains, received money from the Alabama claims. Consult Currier, J. J., 'History of Newburyport' (Newburyport 1906); Hurd, D. H., 'History of Essex County, Mass.' (Philadelphia 1888); Smith, 'History of Newburyport, Mass.' (Boston 1854). Pop. 15,618.

NEWCASTLE, Margaret, DUCHESS OF. See CAVENDISH, MARGARET.

NEWCASTLE, Thomas Pelham Holles, 1ST DUKE OF, English Prime Minister: b. England, 1693; d. 17 Nov. 1768. He was the son and heir of the 1st Lord Pelham and as one of the largest land-owners in England his influence, which he used freely in the service of the king, won favor at court and he was made Duke of Newcastle in 1715. He was appointed secretary of state in 1724 under Walpole, to whose downfall he contributed, and held his

post until he succeeded his brother as Prime Minister in 1754. He retired in 1756 owing to his incompetent conduct of the French War, but was recalled in 1757 and formed the ministry so notable because of the dominating brilliancy of Pitt. He was forced out by Bute in 1762, and afterward lived a retired life with the exception of holding for a few months in 1765 the office of Lord Privy Seal. Newcastle was a small man for whom wealth and social position obtained high offices. He was ignorant of the most elementary things. Such abilities as he had lay in the manipulation and purchase of votes in Parliament, on which he spent money freely.

NEWCASTLE, William Cavendish, DUKE OF. See CAVENDISH, WILLIAM, DUKE OF NEWCASTLE.

NEWCASTLE, Del., city in New Castle County, on the Delaware River, and on the Philadelphia, Baltimore and Washington, and the Philadelphia and Reading railroads, about seven miles south of Wilmington. It was settled, in 1640, by Swedes. Later it was occupied by the Dutch and then by the English. Newcastle was the place where, in 1682, William Penn landed in America. In 1875 it was incorporated. It is in an agricultural region of fruit orchards and market gardens. Its good harbor, regular steamer connection with large cities, and railroad facilities make it an excellent shipping point for farm products, fruit and vegetables. Considerable fish, especially shad, are caught in the nearby waters. Its chief manufactures are flour, brick, canned goods, woolen and cotton goods, iron products, and men's underclothing. Newcastle has a library founded in 1812, several buildings dating back to Colonial times and two parks. Pop. 3,351.

NEWCASTLE, Ind., town, county-seat of Henry County, on the Blue River, and on the Pittsburgh, Cincinnati, Chicago and Saint Louis, the Cleveland, Cincinnati, Chicago and Saint Louis and the Lake Erie and Western railroads, about 45 miles northeast of Indianapolis. It is in a fertile agricultural and also a manufacturing region. The chief manufactures are agricultural implements, flour, paper boxes, iron and steel products, automobiles, caskets, scales, bridges, lathes, bridge works, pianos, brass furniture, carriages, brick and furniture. It has natural gas, good water power and excellent transportation facilities. Nearby is the Indiana village for epileptics comprising 1,250 acres. The city owns and operates the street-lighting plant and the waterworks. Pop. (1920) 14,458.

NEWCASTLE, Pa., city and county-seat of Lawrence County, situated about 50 miles north of Pittsburgh, at the confluence of the Shenango, the Neshannock, and the Mahoning rivers, which there form the Beaver River, and on the Pennsylvania, the Baltimore and Ohio, the Erie, the Pittsburgh and Lake Erie and the Buffalo and Pittsburgh railroads. The city covers an area of 4,773 acres and, situated as it is in one of the richest and most charming valleys in the world, and having unequalled advantages of water power and railway facilities, it offers exceptional opportunities to the ever-increasing population.

Aside from being the commercial centre for a productive agricultural region, the city is in the heart of rich deposits of iron ore, limestone, coal and clay, and is noted for its great variety of industries. These comprise steel and rolling mills, blast furnaces, tinplate mills, car shops, wire works, paints, hosiery, rubber tires, heating apparatus works, also manufactures of machinery, boilers, castings, blast furnace jackets, pottery and table ware, and vitreous sanitary ware.

Prominent among the public buildings are the United States Government Building, containing the post office, the city hall, the opera house and the Y. M. C. A. building, containing a large library, presented by Ira D. Sankey the evangelist. The Shenango Valley Hospital and the Almira Home for Aged Women are located there.

The inhabitants of the city worship in over 35 church edifices representing nearly all denominations. The educational advantages are of the highest standard of excellence; the pupils are accommodated and receive instructions in a high school supplemented with several graded public schools, while a well sustained business college prepares young men and women for commercial life. Besides these there are also several excellent parish schools.

Newcastle stands high in the average of highways paved; the public improvements have practically all been the outcome of the marvelous growth of the city within the last two decades; during that time the electric railway system, connecting with all the surrounding cities and towns, has been built; a complete system of arc lights has been introduced, the capacity of the water system trebled, and an excellent sewerage system constructed. Cascade Park, an amusement resort, was established by the traction company. The Old Park Cemetery and the Graceland cemeteries are the largest of the "cities of the dead." Newcastle was first settled in 1800 by Robert White; became a borough in 1869, and was chartered as a city in 1875. In 1914 the commission form of government was adopted. Pop. (1920) 44,938.

NEWCASTLE-UPON-TYNE, England, a parliamentary, municipal and county borough and episcopal city, in Northumberland County, and on the northern bank of the Tyne, nine miles from its mouth. It is about 272 miles northwest by rail from London and 124 miles southeast from Edinburgh. It occupies the sides and summits of hills that rise steeply from the river. Coal measures constitute the geological formation; and they stretch southwards to Ferry Hill, northwards to Chevington.

Public Buildings.—The principal public buildings are the Moot Hall (the Northumberland assizes are held here); the Hancock Museum (it contains the collection of John Hancock the naturalist, and many drawings of birds, etc., by Thomas Bewick, the engraver); the Keep of the old Castle, built in Henry II's reign and the Black Gate, at the entrance to the Castle yard (now used as an antiquarian museum). Of other buildings there may be mentioned the Town Hall; the Old Assembly Room; the guildhall (in which is the assize court of Newcastle), and below it, the Exchange; and the Grain Warehouse, on the Quayside. There are one central public and

four branch libraries, three of the latter donated by Sir W. H. Stephenson and one by Mr. Andrew Carnegie; while the Literary Philosophical Society, the Society of Antiquaries and the Church Institute have libraries attached. The Laing Art Gallery was donated by Mr. Alexander Laing in 1904. Of the theatres the chief are the Tyne Theatre and the Theatre Royal.

Places of Worship.—The cathedral church of Saint Nicholas has a famous lantern tower, which was added by Robert de Rhodes about 1450, 100 years after the completion of the church. The tower has been copied elsewhere but never equaled. The clock weighs two tons and is controlled from Greenwich. The largest peal of bells weighs 5 tons 18 cwt. Saint Andrew's is said to be the oldest church in Newcastle, but Saint John's disputes the claim. Saint Mary's Cathedral (Roman Catholic) was designed by Pugin; its charming spire was added in 1872.

Schools, Educational Institutions, etc.—Dame Allan's School, Saint Cuthbert's Grammar School (R. C.), Deaf and Dumb Institute, Northern Counties Orphanage, Church High School for Girls, Central High School, Royal Grammar School, etc. The Armstrong College was founded in 1871 by the University of Durham (to which it is affiliated) and the North of England Institute of Mining and Mechanical Engineers. The College of Medicine (also affiliated to the University of Durham) was built in 1887, and cost £31,000. Rutherford College, not affiliated to the University, was founded by the late Dr. Rutherford.

Municipal Enterprises.—The chief municipal undertakings are the markets, the public libraries, fire brigade, electric tramways, baths and washhouses.

Parks, Hospitals, Bridges.—Town Moor (said to have been held by the burgesses from time immemorial), 927 acres; Leazes, 86 acres; other parks and recreation grounds, 270 acres. The old Royal Infirmary is near the Central Station close to the Armstrong College; a new one to commemorate Queen Victoria's Diamond Jubilee was opened in 1906. Other hospitals, etc., are the Eye Infirmary, Fleming Memorial Hospital for Children, Hospital of Diseases of Throat and Ear, for Incurables, etc. The chief bridges over the Tyne are the High Level, 1,375 feet long, with the railway track 112 feet above high water (built by Robert Stephenson, 1846–50, at a cost of nearly £500,000); the Redheugh; the hydraulic swing bridge (built by Lord Armstrong at a cost of £233,000); and a new railway bridge (North Eastern Railway), opened by the king in July 1906. The Byker bridge crosses the Ouseburn and serves foot and vehicular traffic; whilst a railway viaduct, just to the north of it, carries the traffic of the North Eastern Railway.

Industries and Manufactures.—The coal mines are now all outside the city boundaries. Elswick Ordnance Works are in the west of the city, and this section is famous also for its cycles. The most notable other industries are engineering and shipbuilding. To them may be added the trade in lead, chains and anchors, the manufacture of cement, of steam winches and windlasses, of cordage and cable, paper, cranes, pumps and electric machinery. The

chemical trade, formerly active, has declined of late years. The chief exports are coals, machinery, chemicals, manures, cement, manufactured iron, paints, tar, fire-bricks, fire-clay, etc. Quays are built all down the river side; the docks have 19 feet at low water and accommodate vessels of about 7,000 tons.

History.—The town (first called Pons Ælii, then Novocastria, then Monkchester, then Newcastle-upon-Tyne) is situated near the eastern termination of the Wall of Hadrian, and Roman antiquities have been repeatedly discovered in it. In the Anglo-Saxon period it was a monastic centre. The fortress was built by Robert, son of William the Conqueror, about 1080. It was rebuilt by William Rufus, his younger brother, who "buidled the Newcastle upon the Tyne, the Scots for to gaynstande and to defende." About this time the town received its present name. It received a charter from King John, but the oldest extant is said to be by Henry III in 1239, which confers the right of digging for coal in the neighborhood. The coal trade had attained some importance by 1280. Newcastle was a frequent object of attack, and was repeatedly taken in the wars between England and Scotland. It furnished 17 ships to Edward III for the siege of Calais. It was taken by the Scottish Covenanting army in 1640 and in 1644, and in 1646 Charles was delivered here by the Scottish army to the parliamentary commissioners.

Government.—The city is governed by lord, mayor, sheriff, and council. In the year 1400 a royal charter created Newcastle a county in itself, and Newcastle's first sheriff was appointed in that year. In 1600 the great charter (confirming old privileges and adding new ones) was passed. In 1882 a royal charter created Newcastle a city. In 1906 it was made a royal borough. It is the seat of a United States consul. The city returns members to the House of Commons. Pop. 266,603.

Bibliography.—Bruce, 'Reid's Handbook to Newcastle' (1863, rev. ed. 1903); Gray, 'Chorographia' (1649, re-edited by Crawhall and Reid 1884); Histories by Bourne (1736); Brand (1798); Mackenzie (1827), and Welford (1883–87); Sykes, 'Local Records' (1833); Fordyce, 'Local Records' (1867–76); Guthrie, 'River Tyne' (1880); Rendel, 'Newcastle on Tyne: Its Municipal Origin and Growth' (1898); Richardson, 'Handbook to Industries of Newcastle and District' (1889); Johnson, 'Making of the Tyne' (1895); Heslop, 'Northumberland Words' (1893–94); Corporation Manual, current date, etc.

NEWCOMB, nū'kom, Harry Turner, American lawyer and statistician: b. Owosso, Mich., 4 Jan. 1867. He was graduated from the law department of Columbian University in 1891, and entered the offices of the Chicago, Milwaukee and Saint Paul Railroad in 1882. In 1895–99 he was chief of the transportation department of the division of statistics in the United States Department of Agriculture, and in 1899–1901 was expert chief of the division of agriculture for the United States census. In 1896–1901 he was lecturer on statistics at Columbian University, and in 1901–02 he was editor of the *Railway World*. He began the practice of the law in 1902 and was almost im-

mediately employed as counsel for the Philadelphia and Reading Coal and Iron Company in the arbitration before the Gray commission which settled the anthracite strike of 1902. He organized the firm of Newcomb, Churchill and Frey in 1907 and is now the senior member of Newcomb and Frey, its successor. His practice is chiefly in corporate matters and cases involving the law of interstate commerce and those of taxation, in all of which the principles of jurisprudence are in process of adjustment to meet new economic conceptions and conditions. He has written 'Railway Economics' (1898); 'The Postal Deficit' (1900); 'The Work of the Interstate Commerce Commission' (1905); 'Constitutionality of the Delegations in the Interstate Commerce Law' (1910), etc.

NEWCOMB, Simon, American astronomer; b. Wallace, Nova Scotia, 12 March 1835; d. Washington, D. C., 11 July 1909. He came to the United States in 1853 and taught in Maryland; computed on the *Nautical Almanac* at Cambridge 1857, and was graduated from the Lawrence Scientific School at Harvard 1858. He was appointed professor of mathematics in the United States navy in 1861 and assigned to duty at the Naval Observatory; negotiated contract for and supervised construction of the great telescope; was secretary of the transit of Venus commission (1871-82); and observed transit at the Cape of Good Hope in 1882. He also directed several parties to observe eclipses beginning in 1860. From 1877-97 he was senior professor of mathematics and superintendent of the *Nautical Almanac* office. He retired from active duty in the navy (1897) at the required age of 62, and thereafter devoted himself to both pure and popular science. He was professor in Johns Hopkins University 1884-94 and editor of the *American Journal of Mathematics*, retiring in 1901. He was a member of learned societies throughout the world. Since 1874 he was correspondent and since 1893 associate of the Institute of France, being the first native American to receive the latter honor since Franklin; he was also an officer of the Legion of Honor. He received distinctions and degrees from governments and universities in most civilized countries.

He lectured at Harvard, the Lowell Institute at Boston, etc., and delivered opening addresses at the Flower, Yerkes and other observatories. In connection with his work on mathematical astronomy, besides over 100 papers published in various scientific journals, he has written large works 'On the Secular Variations and Mutual Relations of the Orbits of the Asteroids' (1860); 'An Investigation of the Orbit of Neptune' (1874); 'Researches on the Motion of the Moon' (1876); 'Theory of the Inequalities in the Motion of the Moon' (1894); 'Tables of Uranus'; 'Measure of the Velocity of Light' (1884); 'Uranian and Neptune System'; 'Astronomical Constants and Eclipse Tables.' He founded the *Astronomical Papers of the American Ephemeris* and edited the first eight of this series, which contain his tables of the planets and of the stars now used by astronomers all over the world. This work contains Newcomb's famous lunar researches. Among his more popular writings are 'Popular Astronomy' (1878); 'School Astronomy'; 'Elements of Astronomy' (1900); 'Algebra Geometry'; 'Analytical Geometry'; 'Cal-

culus'; 'Essentials of Trigonometry'; 'The Stars' (1901); 'Astronomy for Everybody' (1902); 'A B C of Finance'; 'A Plain Man's Talk on the Labor Question' (1886); 'Principles of Political Economy' (1887); 'His Wisdom the Defender' (1900); 'Reminiscences of an Astronomer' (1903). He was given the rank of rear-admiral by Congress in 1906, and on his death in 1909 was given a military funeral. For an account of his place in science, see Benjamin, M., paper in 'Leading American Men of Science' (New York 1910), edited by D. S. Jordan.

NEWCOMB MEMORIAL COLLEGE FOR WOMEN, New Orleans. See **TULANE UNIVERSITY**.

NEWCOMEN, nū-kōm'ēn, Thomas, English inventor of the atmospheric steam engine; b. Dartmouth, Devonshire, February 1663; d. London, August 1729. With the financial help of John Cawley he experimented on Savery's engine, patented 1698, possibly had made previous study of the same problem at an earlier date and may have been a partner with Savery in the patent taken out in 1710. His improvement of Savery's engine consisted principally in separating boiler, pump and condenser. Steam was let into a cylinder from below and a piston above was thus forced up so that a pump rod attached to it by a balance arm was driven downward; cold water was then introduced into the condensing cylinder, a vacuum was there formed, and the external atmospheric pressure drew the piston down into the cylinder, the pump rod being forced up by this action. Newcomen's engine is practically the modern type, which, however, has Watts' condenser; it was successfully used, notably for pumping water from mines. See **STEAM AND STEAM ENGINES**.

NEWCOMES, The, by Thackeray, published in 1854-55, the last of the four very great novels of the author, is more closely united to 'Pendennis,' to which it is a quasi-sequel, than to 'Vanity Fair' or 'Esmond.' As the theme of 'Vanity Fair' presented a section of life in which most human endeavor ultimately turns to dust and ashes, and 'Pendennis' isolates with almost epic impressiveness the phenomena of the young man, so the 'Newcomes' dwells almost chiefly on family relations. As in the earlier stories Thackeray was faithful to what he saw, and the picture is a powerful one. It is a picture of family rivalry, intrigue, ambition, ill-feeling, worldliness, jealousy, weakness, credulity and many other unattractive characteristics. On the whole the various members of the family are represented in no amiable light: Barnes Newcome is especially detestable, and most of the other Newcomes are mean and selfish. The amiable weakness of the hero, Clive, deserves a better fate than his temporary martyrdom at the tongue of Mrs. Mack the Campaigner, most abominable of mothers-in-law. The two most famous and likable characters, Colonel Newcome and his niece, Ethel Newcome, though they have faults of the head if not of the heart, relieve the general impression. They are the real hero and heroine of the book, and are among the best-known characters in English literature; they are fairly representative of the great vividness and intensity of feeling with which the novel is writ-

ten. Like most of the author's novels, 'The Newcomes' is often highly satirical of English society, Barnes Newcome, Honeyman and young society ladies being specially ridiculed. Certain passages, notably that of the death of Colonel Newcome, are among the famous pieces of writing in English literature. Consult various lives, as that by Trollope and Mrs. Ritchie's introduction in the biographical edition of Thackeray's works.

WILLIAM T. BREWSTER.

NEWDIGATE (nū'dī-gāt) **PRIZE**, a prize in Oxford University, annually awarded for an English poem. It was founded by Sir Roger Newdigate, Bart. (1719-1806), its value being \$110. Among the winners have been several well-known men, such as Ruskin, Matthew and Sir Edwin Arnold, John Addington Symonds and W. H. Mallock.

NEWEL, in architecture, the central space or column round which the steps of a circular staircase are wound. When there is no central pillar the newel is said to be open. The term newel post is also used in this connection.

NEWELL, Frederick Haynes, American engineer, founder of the United States Reclamation Service and its chief engineer from 1902 to 1914: b. Bradford, Pa., 5 March 1862. He was graduated at the Massachusetts Institute of Technology in 1885. Soon after joining the United States Geological Survey in 1888 the director, J. W. Powell, placed him in charge of water investigation, steam gauging and reservoir site surveys, a work which finally developed into the Reclamation Service created by act of Congress, 17 June 1902. Under his direction were built the Roosevelt, Pathfinder, Elephant Butte, Arrowrock and other great dams, and the Gunnison tunnel for the reclamation of about 3,000,000 acres in the West. This work was done with a fund which from 1902 to 1914 amounted to about \$100,000,000. He was member of the commission on revision of land laws, the Inland Water-Ways Commission and of the Natural Advisory Board for fuels and structural materials. After resigning from the Reclamation Service in 1914 he was consulting engineer to that organization until appointed head of the civil engineering department of the State University of Illinois at Urbana. He is the author of 'Hydrography of the Arid Region' (1891); 'Agriculture by Irrigation' (1894); 'The Public Lands of the United States' (1895); 'Irrigation' (1902), and many special reports.

NEWELL, Peter ("SHEAF HERSEY"), American illustrator and humorist: b. McDonough Co., Ill., 5 March 1862; d. 15 Jan. 1924. He was educated at Bushnell, Ill., worked for a photographer, drew crayon portraits, studied in New York at the Art Students' League and in the early 90's became famous for his whimsical illustrations to humorous books and for his own pictures with text, which appeared in various periodicals and were collected as 'Topsys and Turvys' (1893-94), 'Peter Newell's Pictures and Rhymes' (1899), etc. His later work with its striking use of flat tones, possibly traceable to Japanese influence, is to be seen in the illustrations to Lewis Carroll's 'Alice in Wonderland,' 'Alice in the Looking-Glass,' 'The Hunting of the Snark,' 'Mr.

Munchausen,' 'Book of Clever Beasts,' etc. His more recent publications are 'The Hole Book' (1908); 'Jungle Jangle' (1909); 'The Slant Book' (1910); 'The Rocket Book' (1912).

NEWELL, Robert Henry, American humorist, whose pseudonym was "ORPHEUS C. KERR," that is "Office Seeker": b. New York, 13 Dec. 1836; d. Brooklyn, 1 July 1901. He was educated in New York; became assistant editor of the *Sunday Mercury* in 1859; for it wrote his first 'Orpheus C. Kerr Papers,' which were continued in three volumes (1861-64), none possessing much deeper humor than the kind suggested by the title. He was a war correspondent of the *New York Herald*; acted as an editor of the *New York World*, then of the *Daily Graphic*, and later of the *Hearth and Home*, which he left in 1876. In 1878 he began to suffer with writer's cramp and letter-blindness, from which he never recovered. Besides his humorous sketches Newell wrote 'There Was Once a Man,' an anti-Darwinian romance (1884); 'Avery Glibun' (1867); 'The Palace Beautiful' (1865), and 'Versatilities' (1871), both volumes of verse; 'The Cloven Foot,' an adaptation of 'Edwin Drood' (1870), and 'The Walking Doll,' a novel of New York life (1872).

NEWFOUNDLAND, The Atlantic Fisheries Dispute. This fertile source of friction between the United States and Great Britain antedates the War of Independence. In those times the American colonists, as fellow-subjects of England, prosecuted the fisheries of the Grand Banks and Saint Lawrence Gulf on equal terms with the inhabitants of Canada and Newfoundland. During the Revolution the Americans could not exercise it, but by the Treaty of 1783 they regained this liberty. The War of 1812 abrogated it again and seizures of their vessels for attempting to prosecute the industry brought about the Convention of 1818, which fixes the status of the question at present.

The agreement of 1818, known in diplomacy as the Convention of Ghent, is somewhat remarkable. The American commissioners claimed that they still possessed the privileges formerly enjoyed by them as British colonists although war had intervened and they had become an independent nation. The audacity of the claim startled the English government, who answered that it was preposterous. The Americans were bold and insistent, they had many friends,—and as every one desired peace and harmony the convention finally agreed on a compromise on the question. The British government were ignorant both of the geography and the trade of Newfoundland, and they considered the fishing rights they were giving away as practically valueless.

By this treaty the United States abandoned all claims to fishing within the territorial waters of the British North American possessions elsewhere, in return for the right to catch fish inshore on the southwest coast of Newfoundland, between Ramea Isles and Cape Ray; on the west coast, between Cape Ray and Quirpon Isles; on the coast of Labrador, from Mont Joli, opposite Anticosti, eastward and northward indefinitely; and on the shores of the Magdalen Islands, with the further privilege of landing to dry and cure their catch on the un-

settled portions of the southwest coast of Newfoundland and along Labrador.

Differences as to the extent of the territorial jurisdiction and the interpretation of the treaty made the question one of serious menace to Anglo-American amity, owing to the vigorous stand taken by Canada (including Newfoundland) against the American fishermen, until 1854, when by a reciprocity treaty the Canadian fishery products were granted free entry into the United States. This accord was abrogated by Congress in 1866, the Convention of 1818 being reverted to. At once friction revived, and in 1871 it became necessary to conclude the "Washington Treaty" which embraced a series of articles dealing with the fishery problem. These provided for reciprocal fishing concessions in Canadian waters, and in American waters north of lat. 36°, but as Canada claimed that America secured the more valuable privileges an arbitration to dispose of this point was agreed upon. The fishery articles became operative 1 July 1873, the arbitration was held at Halifax (Nova Scotia) in 1877, and the tribunal, presided over by M. De la Fosse, Belgian Minister at Washington, awarded Canada \$5,500,000, of which \$1,000,000 went to Newfoundland. Congress abrogated the "fishery articles" in 1885, and again the Convention of 1818 governed this entanglement with the result of further trouble, so that in 1888 another fishery treaty, on similar lines to its predecessors, was arranged between the plenipotentiaries, Secretary Bayard and Mr. Chamberlain, only to be rejected by the United States Senate.

At this point Newfoundland and Canada parted company, so far as their attitude toward the United States was concerned. A *modus vivendi* for two years, to admit of the treaty being adequately considered by the Senate, had been arranged between the high contracting parties, granting American fisher-vessels, on payment of a license of \$1.50 per ship-ton, the right to enter the non-treaty waters of Canada and Newfoundland to purchase bait, ice, stores, and outfits; to transship cargoes and to hire men. When the treaty was rejected Newfoundland saw that fishery reciprocity between the United States and Canada was hopeless, and offered the former an accord on her own behalf. The proposal was accepted in 1891, when Secretary Blaine and Colonial Secretary (subsequently Premier) Bond drafted the Bond-Blaine Convention, providing privileges for American fishermen in Newfoundland waters in return for free entry of Newfoundland fish into American markets.

When it was ready for ratification, Canada protested against it, claiming that Newfoundland should not be allowed to make such a compact without including the dominion, and the British government, to avert a collision between the greater colony and the smaller, pigeon-holed this draft till Canada should have had an opportunity to effect a similar understanding. But this she could not do, though the Conservative and Liberal cabinets both sought terms from Washington, and as neither Canada nor Newfoundland dared abrogate the *modus vivendi* while hoping for a solution of the deadlock the temporary arrangement continued year after year. In 1902 Canada withdrew her protest and Sir Robert Bond revived the moribund draft

with Secretary Hay, the new one being known as the Bond-Hay Treaty, and containing improvements suggested by 12 years of discussion.

In 1904 the United States Senate "amended this to death," at the instance of the New England fishery interests, and then Newfoundland resolved to cancel the *modus vivendi*. This her legislature did by an enactment in April 1905 excluding all American fishing vessels from her non-treaty waters, save for wood, water, shelter or repairs, privileges conceded by the Convention of 1818; and, as regards her treaty waters, restricting them to the mere rights that compact assured to them. The first effect was to hamper them in securing bait for their deep-sea fishing, for which Newfoundland is the natural base, because of its proximity to these shoals. The second was to partially destroy the winter herring fishery on the west coast. Here they have treaty rights, but these are not ample enough to enable them to prosecute this industry successfully, as they need large numbers of coastfolk for netting and the use of the strand for salting or freezing the fish, and the residents were forbidden to work for, or sell to them; it being usual for the Americans previously, with the approval of the colonial government, to buy whole cargoes from the settlers who caught the fish. The withdrawal of these privileges seriously hampered the Americans and lessened their catch. They would, indeed, have fared even worse but that they succeeded in evading the colonial laws by inducing the coastfolk to proceed outside the three-mile limit and hire on board their ships there, returning then into territorial waters and serving as members of their crews.

This claim of the Americans to ship Newfoundlanders outside the three-mile limit and then return with them into port as legally part of their crew was not confirmed at Washington. The State Department discountenanced it and instructed the American fishermen that they only bring into Newfoundland waters crews shipped in American ports.

Newfoundland, early in 1906, passed a further act making it illegal for any of her people to leave her waters for such a purpose, or for any foreign fishing vessel to enter her waters with such men on board, while the Americans were also required to pay light dues, observe colonial fishery regulations, and enter and clear at the custom-houses, which obligations they had declined to subscribe to since the rupture. On one of these questions, the claim of the Newfoundland government to compel all American vessels to enter and clear at the Custom House is unanswerable. All nations have an inherent right to protect their revenues from smuggling. The supply of goods aboard their schooners known as "the slop chest" is solely for this purpose. Canada has always compelled them to enter and clear their vessels when visiting Dominion ports, and Newfoundland claimed the same right. The United States government did not uphold its fishermen on this point. The payment of light dues rests upon the same basis. The most contentious question was, how far are the Americans bound to obey local fishery laws? Where these regulations are general and simply for the protection of the species from destruction, it would seem reasonable that they should be obeyed. One point on which

there was some friction was the right of the Americans to fish on Sunday. This irritated the Newfoundlanders more than anything else and caused the trouble years ago known as "the Fortune Bay Outrage." As grave international problems were involved in the whole question, the British and American governments opened negotiations for an adjustment of it, appeal being made to The Hague Tribunal and the decision was not reached until 7 Sept. 1910, and in July 1912 a supplementary treaty was concluded giving binding effect to those parts of the award which were in the nature of recommendations only.

Taken altogether the award was a victory for the United States. Neither British imperial nor colonial authorities can compel American fishermen to report to the custom houses, nor can they impose upon these fishermen light, harbor or other dues. Hereafter American fishermen can employ Newfoundlanders on their vessels and they will also have the right to purchase supplies and enjoy other commercial privileges in Canadian ports. It was also specified by the tribunal that future disputes regarding fisheries regulations shall be adjusted by an impartial commission selected for that purpose.

Hon. Elihu Root was the chief pleader for the United States at The Hague, while Sir William Robson appeared for Great Britain.

P. T. McGRATH,

Editor 'The Evening Herald,' Saint Johns, N. F.

NEWFOUNDLAND. Geography.—Newfoundland, the tenth largest island in the world, is situated on the east coast of North America, between lat. $46^{\circ} 37'$ and $51^{\circ} 39'$ N. and long. $52^{\circ} 35'$ and $59^{\circ} 25'$ W. It occupies much the same geographical position in the New World as the British Isles do in the Old. The colony lies generally in a more southern latitude than the British Isles. It is larger than Ireland, containing 42,734 square miles. It is divided from the continent on the southwest by Cabot Straits, about 60 miles wide, and on the northeast by the Straits of Belle Isle, 10 miles wide. It juts far out into the Atlantic and is the nearest American land to Europe, being only 1,640 miles from Ireland and 1,213 from New York. Labrador, from Hudson's Strait to Blanc Sablon, including the basin of the Hamilton, is included in the Dominion, the remainder of the Labrador Peninsula forming part of the Dominion of Canada. Area, 120,000 square miles with a coast line of about 600 miles facing Newfoundland.

Topographical Features.—On the east coast the land is high and looks very rocky and barren; on the west coast the character of the country changes completely after Cape Ray is passed. Instead of the stern, forbidding mountainous aspect of the east and south coast the land is level, well timbered and fertile. An American artist has declared that the scenery of Bay of Islands on the Newfoundland west coast is the most picturesque in North America. The numerous river valleys are very beautiful, especially the Humber, Codroy, etc. Much of the interior is moorland and marsh, well wooded around the numerous lakes and rivers. Most of the good land lies in these alluvial valleys. The west has a finer climate and the land

generally is superior to the soil of the eastern shore. In the interior there are many isolated peaks. The chain of mountains known as the Long Range extends from Cape Ray for about 100 miles into the interior. There is another high range of mountains near the centre of the island. The highest peak is a little over 2,000 feet. The Atlantic coast line of Newfoundland and the southern shore have noble inlets, bays and harbors, admirably adapted for carrying on its great industry, the cod fishery.

Hydrography.—The peculiar feature of Newfoundland are the innumerable lakes, only two of which are large, Grand Lake and Red Indian Lake. Both are long and narrow, Grand Lake about 60 miles long and Red Indian Lake about 50; but neither is over 10 miles wide in any part. Glover Island in Grand Lake is 52 miles long. The largest river in the island is the Exploits, which is navigable for about 50 miles from the mouth of its estuary. The Humber, Gander, Codroys and Terra Nova rivers are all fine streams, but of no value for navigation except by canoes.

Soil.—In many parts of the island there is very good land, especially in the Codroy Valley, Saint George's Bay and the Humber Valley. Deer Lake, Red Indian, Exploits Arm and the River Valley also contain good soil. Fine timber and good ground fit for cultivation surround both the Gander River and Lake. There is also good agricultural land around Avalon Peninsula. Trinity Bay, S. W. Arm, Green Bay, Notre Dame Bay, some parts of White Bay, Mortier, Placentia, Bonavista and Saint Mary's Bays. There are thousands of acres of splendid grazing ground and fine pasture lands specially suitable for sheep.

Minerals.—Newfoundland is celebrated as a producer of copper and iron, copper from the well-known Tilt Cove mine and iron from Bell Island. Iron of various kinds has been found in the north. The iron output in a recent year amounted to 656,000 tons. Argentiferous galena occurs in Placentia Bay. Asbestos is common and mica. Gold is being worked on a small scale in White Bay and petroleum of excellent quality is now being pumped at Parsons' Pond on the west coast. Slate and marble are abundant. A large deposit of talc has been opened and an aerial tramway built to it near Manuels Conception Bay. The country is almost wholly unexplored and her great mineral treasures, especially her valuable coal deposits, have not yet been tested in an efficient way with the boring machine. They are an extension of the Cape Breton coal fields and extend nearly across the island from Codroy to Green Bay. The annual mineral production is about \$3,000,000 in value.

Climate.—The Summer climate of Newfoundland from June until October is delightful. There is plenty of sunshine but no extremes of heat, seldom higher than 70° in the shade. The winter climate is not so severe as in Canada. Zero is only occasionally touched. The spring is late and the weather variable, due to the influence of the Labrador current which brings along the ice. During the last few decades the climate has improved and there is now no very heavy snowfall or intense frost before the end of November. The fog lies on the coast and only rarely comes in on the land.

Animal Life.—Newfoundland is the home of the woodland caribou. All the interior is one vast deer park where countless thousands of these fine animals range unmolested and unseen by man. Black bears, the grey wolf, now very scarce, the lynx, foxes, beavers and otters are indigenous. The varying hare has been introduced and now swarm all over the island. The Arctic hare is a native as well as the willow grouse and ptarmigan. There are plenty of snipe, ducks and geese, but no woodcock. The rivers abound with salmon and trout; there are no predaceous fishes, such as pike or pickerel.

Agriculture.—The main business of the colony is the fishery. Agriculture is only an auxiliary, and is mainly confined to the coast. The chief crops are oats, potatoes and turnips. There are 231,359 acres under cultivation or in pasture. About 541,000 bushels of potatoes; 11,000 bushels of oats; 65,298 bushels of turnips represent an average year's product. There are about 13,288 horses; 40,000 head of cattle; 100,000 sheep and 30,000 pigs. About \$600,000 worth of agricultural product is imported into the colony every year from the United States and Canada, all of which could be raised in the island. The farming around the capital is excellent. On the west coast, where the very best land is situated, is still very primitive. Before the outbreak of the war the total value of all the agricultural produce raised on the island was about \$2,000,000. This has been greatly increased by enhanced prices and more and better cultivation under the stern necessities of war.

Lumbering.—This industry has been greatly increased by capitalists from Canada and New England. The chief woods are spruce, white and yellow pine, red pine, fir, juniper, birch, witch hazel, aspen and white maple. There are now in operation several paper and pulp mills producing about 100 tons of paper and 250 tons of pulp daily, most of which is exported to England.

Fisheries.—The great industry of Newfoundland is the fishery. The Grand Bank fishery has declined of late but its loss has been made good by the increase of the fishery in coastal waters and along the Labrador Coast. Under the terms of the Anglo-French Convention of 1904 France renounced her exclusive fishing rights under the Treaty of Utrecht, but retained the right to fish in territorial waters from Saint John's Cape north to Cape Ray. In 1909 the Newfoundland fisheries disputes were submitted to The Hague and the award, given in 1910, secured the right of Great Britain to make regulations without the consent of the United States, subject to any limitations imposed by treaty. In the Grand Bank cod fishery in 1914, there were engaged 1,892 men and 105 Newfoundland sailing vessels, aggregating 7,790 net tons. The catch totaled 124,067 quintals of dry fish, valued at \$775,418. The coastal-waters cod fishery for the same year engaged 15,823 small sail vessels, motor boats, etc., and 48,221 men. The catch aggregated 1,032,198 quintals of dry fish, valued at \$6,193,188. On the Labrador fishery over 800 vessels and 5,500 men were engaged. The exports of codfish, including the Labrador fishery, aggregated 1,247,314 quintals. The lobster catch was 11,017 cases in 1914 and 6,022 cases in the year following. In the year 1914 there were eight vessels en-

gaged in whaling. The catch included 142 finbacks, 13 humpbacks, one sperm and five sulphur bottoms, a total of 161 whales, valued at \$85,008. The factories connected with the whaling industry turned out 150,146 gallons of oil, 256 tons of guano and over 80 tons of bone in 1914. The seal fishery in the same year yielded 233,719 seals, but fell to 47,004 in 1915. About 20 steam vessels and 4,000 men were formerly engaged in sealing. Sealing is now restricted by law to one month (16 March–16 April). The total value of all fisheries averages \$10,000,000 annually but in 1917 reached the unprecedented value of \$14,258,555. The codfishery, both in extent of area and in production, is the largest in the world. The most remarkable feature in this great industry is its stability and uniform success. As certain as seed time and harvest there come every year to the shores of Newfoundland the regular supply of the bait fishes in orderly sequence, herring, caplin and squid, and the voracious cod. The seal fishery is much more variable, some years being a complete failure, other years a great success. The industry was formerly prosecuted in sailing vessels, now it is carried on in 23 steamers. In 1918 a cold storage plant was erected for chilling fish, with a capacity of 200,000 pounds per day. During the year the chilled product of this plant was exported to England and fetched handsome prices.

The herring fishery is another large industry. The movements of the fish are sometimes very irregular and the year's catches variable, unlike the steady uniformity of the codfishery which has continued for over four centuries steadily productive. The Labrador herring, once so famous, is now a thing of the past. Owing to judicious protection, salmon are year by year increasing and every season an increasing number of anglers come to enjoy the sport, principally from the United States. See NEWFOUNDLAND, THE FRENCH SHORE QUESTION IN.

Manufactures.—Ship building is extensively carried on in the outports of the colony. There are also a very large number of saw mills, some very small and primitive, others on a large scale with all the best and most modern appliances. Nearly all the other manufactures are carried on at the capital, Saint Johns (q.v.). Paper-making has been inaugurated on a large scale and bids fair to have an annual output worth \$10,000,000.

Trade and Commerce.—The main import trade is done with Great Britain, United States and Canada. Imports in 1914–15 were valued at \$12,693,860; in 1913–14 they were valued at \$15,609,990, comprising textiles, \$1,852,968; flour, \$1,823,551; coal, \$1,066,762; hardware, \$901,756; salt pork, \$753,309; machinery, \$729,225; tea, \$224,382; molasses, \$208,949. The exports in the same year (1914–15) were valued at \$13,501,795 against \$15,549,185 in 1913–14, when there were exported dried cod to the value of \$8,071,899; pulp and paper, \$2,168,164; iron ore, etc., \$1,370,375; herring, \$469,546; seal oil, \$409,060; cod oil, \$386,825; seal skins, \$350,794; canned lobsters, \$347,941. Of the total imports (\$15,549,185) in 1913–14, merchandise to the value of \$3,826,529 came from the United Kingdom, \$5,192,462 from British possessions (mainly Canada) and \$5,796,906 from the United States. Exports to the value of \$3,256,446 were sent to the United Kingdom, \$2,522,159

to British possessions (mainly Canada), \$1,679,362 to the United States and \$7,676,606 to other countries. Imports from the United Kingdom in 1916-17 were valued at \$2,620,033, from the United States, \$10,233,899, and from Canada \$7,412,300. Trade with England is decreasing, whilst business with the States and Canada is on the increase.

The cause of this change is not far to seek. Whilst British capital has neglected Newfoundland, Canadians and Americans have been prompt to secure the advantages offered by the island's minerals and timber. They have realized that there are great possibilities in the colony. The exports of Newfoundland (1916-17, \$22,381,762) go principally to the United Kingdom, United States, Portugal, Brazil, Spain, Italy and Canada, chiefly dry codfish. Sealskins and oils go to the United States, England, and in small amounts to Canada. The iron ore goes to Canada, copper to England and iron pyrites to the United States. Trade is steadily increasing and the country is very prosperous.

The Revenue of the colony is nearly all derived from the customs and is considerably in excess of the expenditure. In 1913-14 and in 1914-15, however, the expenditures exceeded the revenues. In the first-named fiscal year the revenue was \$3,718,840 against \$4,029,070 for expenditure and in the following \$4,059,145 revenue against \$4,119,975 for expenditures. Customs receipts for 1916-17 amounted to \$4,470,537, and the total revenue was \$5,206,647; expenditures amounted to \$4,554,890. The public debt amounted in 1915 to \$32,328,415, principally incurred for railway construction and public works, and includes the municipal debt of Saint Johns.

Means of Communication.—There are steamers running along the coast north and south. There are excellent main and branch roads. With some of the northern outports and Labrador, communication in winter is maintained with difficulty by couriers. With the outside world, England, the United States and Canada there are several lines of steamers. There are in operation 828 miles of government railway line with a gauge of three feet six inches, and 47 miles of private lines. The government contracted for five branch lines in 1910 to Bonavista, Heart's Content, Grate's Grove, Trepassey, Fortune Bay and Bonne Bay, at \$15,000 per mile for construction and 4,000 acres of land per mile constructed for operation. These lines were opened by 1914 and have opened up fertile sections of land. There are 736 post offices, 4,524 miles of telegraph line and 926 miles of telephone wire.

Education.—This is conducted on purely denominational lines, each sect controlling its own educational money. Even the Salvation Army has its separate schools. In the capital and larger communities it works fairly well. The colleges and high schools are very efficient. In the smaller places this system of division is ruinous to good instruction. Its very worst effect is seen on some of the small islands where it actually destroys education. Students at colleges of the Roman Catholic Church, 492; Methodist colleges, 475; Church of England colleges, 375. The Church of England has 395 schools of all kinds, the Roman Catholic 368 and the Methodist 364, and other denominations

52. The attendance in Roman Catholic 17,560, Church of England 16,362, Methodist 15,488 and others 2,072, making a total of 51,482. The total expenditure on education in 1914, including government grants, fees, etc., was \$400,358.

Religion.—The principal denominations are Roman Catholics with 81,177 adherents, Church of England, 78,616; Methodists, 68,042, Salvation Army, 10,141; Presbyterians, 1,876 and 2,767 of other denominations.

Government.—The government is administered by a governor, assisted by an executive council not exceeding nine members, a legislative council not exceeding 24 members and an elective house of assembly consisting of 36 representatives. Members of the legislative council receive \$120 per session, members of assembly \$200 or \$300 per session, according as they are resident or not in Saint John's. The legislative council is nominated by the governor.

Population and Principal Towns.—In 1914 the population of Newfoundland was 247,710 (126,239 males and 121,471 females). The inhabitants are chiefly of Anglo-Saxon and Irish descent. Outside of the capital (32,292) there are no other large centres of population. The largest is Harbour Grace in Conception Bay, with 4,279 population; Bonavista, 3,696; Twillingate, 3,348; Carbonear, 3,703. Of the total population, 67,000 are engaged in the fisheries; 2,915 on farms; 5,376 are mechanics and 2,260 are miners. The birth rate is 30.42 and the death rate 15.66 per 1,000. In 1914 there were 11,260 immigrants and 10,825 emigrants.

History.—The early history of the Colony involves the story of the discovery of North America by John Cabot in 1497, a memorable voyage fraught with far-reaching consequences. The immediate result of the discovery was the springing up of a great transatlantic cod-fishery which first drew Britons from the narrow seas, made them a nation of sailors and laid the foundation of the British Colonial Empire. For a long time this industry was carried on secretly to avoid the exaction and tyranny of the Crown. There was not only a great fishery but a big barter trade in operation between the English and foreign sailors. By the reign of Elizabeth this business carried on by Devonshire men had grown so extensive that Raleigh declared it was the mainstay of the Western Counties then the chief maritime centre of England. The story of Newfoundland naturally divides itself into four periods. First, the early period from 1497 to 1610 when there was neither law, religion or government in the island. English and foreign fishermen were ruled in a rough way by the valiant men of Devon, traders and pirates. Second, the fishing admiral period, 1610 to 1711, a time of struggle between the settlers and the ship fishermen from England. The permanent inhabitants were very much aided by their colonial brethren from the American Colonies. Trade began with them in 1641 and so increased that by the time of the Revolution it amounted to \$4,000,000. One of the largest items in this trade was the supply of New England rum. Thousands of Devonshire men were smuggled away every year to New England and thus helped to build up the trade fisheries of the American Colonies which became so formidable as to rival England and excited the great admiration of Edmund Burke. Third, from 1711

to 1825 when the island was under naval governors and at last possessed a resident ruler and a form of settled administration. Fourth, the modern period from 1825 up to the present time. When first the Colony was discovered it was inhabited by a branch of the great Algonquin family of Indians known amongst themselves as the "Beothucks." Their principal settlement was in the interior around Red Indian Lake. They became extinct early in the last century. Misunderstandings arose between them and the white men and the feud ended in the dire disaster to the aborigines. Starvation and disease combined with the dire hostility of the Mic-Macs who early obtained the use of firearms helped to destroy this interesting race.

The modern period can only be very briefly sketched. The Colony suffered severely from the policy of the Home Government which opposed settlement and tried by every means to use the island simply as a fishing station for British fishermen. No grants of land were issued until 1813. After the country obtained a local government in 1832 and full responsible government in 1855, it went ahead fast. The most wonderful feature in its history is the marvelous recuperative power of the insular population,—under the direst calamities, invasions from the French, fires and lastly in 1892 a conflagration, which consumed half the Capital, followed in 1894 by a bank crash which financially ruined nearly every one in the island. The real advance of Newfoundland may be dated from the advent of the railway in 1881, since built right across the island, and giving regular communication with the United States and Canada. The movement was bitterly opposed by the fish merchants and others but every one now recognizes its beneficial results in building up new industries. The principal events in the modern history of the island were the settlement of the fisheries dispute with France and later with the United States. Federation with Canada has been more than once a burning political issue and even yet there are a few in favor of it.

Revised by J. B. McDONNELL.

NEWFOUNDLAND, Bank of, in its widest sense is a submarine island 600 miles long and 200 miles broad covered by water less than 50 fathoms deep, lying off the island of Newfoundland, within a degree of the eastern

coast. They must be regarded as belonging to the primitive features of the terrestrial crust and forming part of the pedestal on which the American continent itself reposes. The confluence of the Arctic current and the Gulf stream generate here the fogs or vapors characteristic of the eastern waters of Newfoundland. During the spring, summer and autumn months when the Gulf stream prevails in this region, the mists roll up in abundance from the surface of the suddenly chilled waters and the surrounding seas become enveloped in fogs covering a space as large as France or even as half the European continent. The reports of sea-farers for the most part, familiar only with the southeastern ports and approaches of Newfoundland, tend to confuse the island itself with its banks; hence dense fogs are commonly regarded as a normal if not permanent feature of its climate. Doubtless during the prevalence of the south and southeast winds the vapors are rolled up from the banks by atmospheric currents, and at such times they are spread in thick masses over the creeks and inlets along the south coast. But as a rule they seldom penetrate far into the interior, and, according to the local saying, "The land eats the fog." The Great Bank, far more extensive than Newfoundland itself, does not present any indented contour lines like the shores of the island. The Great Bank is a curvilinear triangle with rounded outlines. If the whole submarine mass upheaved it would attach itself as a heavy peninsula to North America. A few cavities have been discovered in the sands of the bed. "Whale Hole," for instance, caused perhaps by the eddies of the conflicting currents in the western part of the Grand Bank, south of Cape Race, sinks to a depth of 400 feet. An equally deep chasm lies on the northwest. About 125 miles east another bank, called Bonnet-Flamand, rises in an oval mass above the chasms surrounding it, which sink to a depth of 500 fathoms. It is in the vicinity of these plateaus that the ocean bed drops into the deepest chasm yet revealed in the whole Atlantic. The seas break over the Newfoundland Banks although they are covered with water 40 or 50 fathoms deep. "Hence their approach is usually revealed to mariners," writes Élisée Réclus, "by the heavy chopping waters fringing their borders. But within this fringe of agitated waters the sea is generally calm, so that the Bank itself might be regarded as forming a veritable harbor of refuge but for the risk of collision with the fishing-smacks, or icebergs. The large Atlantic liners, the most dreaded in case of collision, owing to their speed and enormous size, pass regularly over the Southern 'tail' of the Bank, thereby prolonging their passage by three or four hours, but avoiding disaster. The long convoys of icebergs drifting with the polar current are a source of danger to be guarded against by the experience, skill and presence of mind of the mariners navigating these waters. The skipper has to study from a distance the aspect of the surface, the glint of the crystal masses reflected from the clouds, the dense fogs and clear skies. He must take note in the waters of the changes of temperature, of color and of animal life, and when the sea is wrapped in impenetrable mist he must be ready for every

contingency. These convoys, drifting down from the higher latitudes, pass for the most part along the eastern section of the Bank, a few straggling blocks alone attracted to the neighborhood of the Newfoundland coast. Their route is largely determined by the action of the Gulf Stream which sets in the direction from southwest to northeast.

"The hypothesis has long been advanced that the Newfoundland Banks have been formed by the débris of all kinds deposited by the melting icebergs in the region where converge the two opposing currents from Baffin Bay and the Gulf of Mexico. Careful observations have shown that in the North Atlantic the polar drift-ice contains but a very small quantity of the rocks and stony fragments and glacial clays either brought down with the glaciers from the rocky slopes of Greenland, or carried away from the bed of the lower gorges. All the blocks that get stranded on the Newfoundland coast are pure as crystal and singularly free from sedimentary matter. Hence they can have contributed little or nothing to the construction of the submarine bed stretching southeastwards from the island of Newfoundland. The fisheries grounds here are among the most productive in the world. The Banks are the chief breeding-place of the cod. Herring, salmon, trout, whales and seals are also found in great numbers. These treasures are stored by three nations: United States, England and France. See FISHERIES.

NEWFOUNDLAND, The French Shore Question in. The long-standing dispute between England and France about fishing rights in Newfoundland is generally known as "the French Shore question." Most writers begin its history with reference to the Treaty of Utrecht, (1713) when, by agreement between the two countries, certain privileges were given to the French on the west and northeast coast of Newfoundland. It really commences, however, with the defeat of the Invincible Armada. The extinction of Spain's naval power by that great victory left the two great powers face to face, and from this date begins the long duel between France and England for the command of the sea and the control of North America. The contest ended disastrously for France at the fall of Quebec and the battle of Trafalgar. Both her naval power and her great American Empire disappeared. All that now remained to her of New France were the two barren islets of Saint Pierre and Miquelon and the doubtful fishery rights in Newfoundland. It was the sentimental and national feeling involved in this dispute that made it so difficult to settle. The French claims are based on the Treaties of Utrecht (1713), Paris and Versailles, the main basis being the first of these agreements. It begins with declaring that the island of Newfoundland shall belong of right to Great Britain. Moreover, it shall not be lawful for the subjects of France to fortify any place in Newfoundland or to erect any buildings there, besides stakes made of boards and huts necessary and useful for the drying of fish, or to resort to the island beyond the time necessary for fishing and drying of fish. But it shall be allowed to the subjects of France to catch fish and to dry them on land, in that part only. The boundaries were first given between

Cape Bonavista and Point Riche on the west coast, afterward altered to the last limits between Cape John and Cape Ray. By the Treaty of Paris (1763) Saint Pierre and Miquelon were given to France. By the Treaty of Versailles (1783) the last boundaries were settled, and there was a secret declaration made by George III that the English were not to interrupt the French fishery by their competition. It was this last underhand clause, not made public in the Treaty, which has given rise to so much contention. The English government always claimed that it was a concurrent fishery. The French, and with right, argued that under this declaration their rights were exclusive—the French contention would have been unanswerable if they had been able to occupy the whole coast line, but, as a matter of fact, their business was solely confined to about a dozen stations. They encouraged English fishermen to settle near their establishments to take care of their property during their absence. As the French business on the coast declined the native settlers increased until they numbered 17,000, compared with the 300 Frenchmen. Difficulties and disputes between the rivals were constantly arising, and but for the tact and good management of the naval officers of both countries would have become acute. The highest authority on English foreign politics, Sir Charles Dilke, and Admiral Revilliere of the French navy declared it was "the most dangerous question between England and France." Carrying on this transatlantic fishery in rivalry with opponents who lived on the coast was utterly hopeless to the French. They were hampered with the burden of carrying on a business 2,000 miles from their base of supplies. Every season they had to bring out their men and gear from France, and in October to carry them all back again. No bounties could support such a hopeless undertaking. Up to the beginning of the last century the French carried on an immense business in Newfoundland as well as their Bank-fishery from Saint Pierre, but gradually the Shore fishery declined until of late years it has come down to a dozen old brigs and about 300 men from France. Although bounty was piled on bounty and millions of francs were spent by the home government in trying to keep the business alive, it went down and down. For a time after 1890, when by a "modus vivendi" the French were allowed to erect lobster factories, an added impetus was given to the industry. At that time 7,000 cases of lobsters, at \$11 and \$12 a case, were really worth more than their whole catch of cod. Eventually the lobsters became fished out. Since 1842, 20 commissions have sat upon the question, but no agreement could be arrived at. When the Anglo-French Convention of 1904, known as the Lansdowne-Cambon Convention, was eventually agreed on, the most difficult subject of all was the French shore dispute, but the great French Minister Delcassé rose to the occasion and made the nation actually believe that, although England was giving France a free hand in Morocco, territory in Africa, and valued gifts elsewhere, French fishery rights in Newfoundland still remained intact. As a matter of fact, the old treaties have been annulled. All the French fishermen have been paid more than 10 times the value of their premises, boats,

gear, etc., \$275,000, and since the agreement in 1904, and the arbitration about values, not a solitary Frenchman has ever returned to the French shore.

NEWFOUNLAND DOG, a large, handsome, long-haired, water-loving dog, originating in Newfoundland, probably from a cross between the native Indian sledge-dog and imported European dogs introduced by navigators early in the 17th century, and especially by the pointer. The breed showed extraordinary retrieving powers and was sent to Europe in so large numbers and at so high prices that it long ago became almost extinct in Newfoundland. It has, however, been maintained pure and has also increased in size by various breeding kennels both in Great Britain and the United States. The Newfoundland is massive in appearance and may attain a height of 31 inches at the shoulders; the average weight for dogs is 100 pounds and for bitches 85 pounds. The head is broad and massive with flat skull and somewhat square muzzle and the ears are small and lie close to the head. The fore legs are straight and the hind legs capable of powerful action and the tail is carried gaily but not curled over. The hair is straight and very thick and in color is black, black and white or bronze. For rescue work directed from the monastery of Saint Bernard in the Alps, the Newfoundland has superseded the famous Saint Bernard dog. For standard of points see Dog.

NEWGATE PRISON. At first marking the "New Gate" of the city of London as far back as the beginning of the 12th century, "New Gate" became Newgate prison in 1218, and throughout its career of 700 years, earned for itself a most unenviable reputation. It was rebuilt in the 15th century; the great fire of 1666 partially destroyed it, and the last edifice was erected in 1780, but suffered greatly in the Gordon Riots of that year, when 300 prisoners, felons as well as debtors, were let loose on the public. (See DICKENS' 'BARNABY RUDGE'). As late as 1850 prisoners were kept in herds like cattle, with no cleaners to attend to them. Proper sanitation or even decent ventilation was unknown in Newgate even up to the date of its demolition, and no attempt at all was made to separate the sexes until the early part of the 19th century.

Prisoners arrested by the king's warrant were the first inhabitants of Newgate. Then came Jew child-murderers and debtors. Thieves and other criminals were in due course locked up there, where they mixed with debtors, and owing to slackness of administration it became a great school of crime. Up to 1818 prisoners cooked their own meals. New "clients" were compelled to pay "garnish" or "footing" to their fellow-prisoners. If they could pay they could secure luxuries. If they were poor, they had to beg even for food. Prisoners were tortured at Newgate in the days of religious persecution. Many of them stayed for years and died there without ever having their cases heard in any court. Condemned criminals, during several reigns, were sent to Newgate, where Dick Turpin was incarcerated and others of his contemporaries. With an eye to their "edification," prisoners under sentence of death were at one time seated in the "condemned pew" around a

coffin at the chapel services. The building was gradually disused after 1877, and it was demolished in 1904 to make room for the Middlesex Sessions House. Consult Griffith's 'Chronicles of Newgate.' (1884).

NEWHALL, nū'hāl, Charles Stedman, American author: b. Boston, Mass., 4 Oct. 1842. He was graduated at Amherst in 1869 and at Union Theological Seminary in 1872. He held the pastorate of various churches and for a time served as teacher and college professor. In 1897 he was appointed United States assistant special forest agent and a little later superintendent of the United States Forest Reserves of central and northern California. He continued in the United States Forestry Service until 1905. He has written 'History of Fall River' (1862); 'Ruthie's Story' (1888); 'Vines of Northeastern America' (1897); 'Fire and the U. S. Reserves' (1902); 'Joe and the Howards' (1869); 'Harry's Trip to the Orient' (1885); 'Trees of Northeastern America' (1890); 'Shrubs of Northeastern America' (1893); 'Sheep and the U. S. Reserves' (1901); 'Lumbering and the U. S. Reserves' (1905), etc.

NEWHAVEN, England, town in Sussex, 56 miles south of London and eight miles east of Brighton. It was the ancient port of the Ouse and is now the well-known place of embarkation for Dieppe, between which place and Newhaven large and fast steamers ply daily in connection with the *Chemin de fer de l'Ouest*. The tidal harbor is enclosed by two piers and a breakwater, and Newhaven is one of the finest roadsteads on the English coast. The area is about 30 acres. The port is protected by fortifications. The shipping was of great importance in the 18th century; then it declined, and of late years it revived again. The harbor was first granted in 1713. Saint Michael's is a beautiful Norman church of the 12th century with a square Norman embattled tower and small semi-circular apse, curiously like that of Yainville-sur-Seine. At Bishopstone, one mile distant, is an interesting church with a Saxon porch and dial. Newhaven has a large coasting trade of coal and provisions, and France sends here wine, spirits, silk, fruit and vegetables. Considerable ship-building is also carried on. In the Bridge Hotel, Louis Philippe, a refugee from France, stayed in 1848 under the name of "Mr. Smith." Pop. 6,665.

NEWLANDS, Francis Griffith, American senator and legislator: b. Natchez, Miss., 28 Aug. 1848; d. Washington, D. C., 24 Dec. 1917. He studied at Yale, in the Columbian Law School (now George Washington University) in Washington, D. C., and was admitted to the bar in the District of Columbia in 1870. He practised law in San Francisco until 1886, when he became a trustee of the estate of his father-in-law, William Sharon, once United States senator from Nevada. In 1889 he removed to Nevada, settling in Reno. Here he became an ardent advocate of free silver coinage. He also took a vital interest in irrigation development and other matters of western interest. He was elected to the House of Representatives as a Democrat in 1893 and continued by re-election until 1903, when he became United States senator succeeding J. P. Jones. In 1909 and in 1914 he was re-elected. He framed the

Newlands Reclamation Act (1902); was member of the committees of ways and means, foreign affairs, etc.; was chairman on interstate commerce, prominent in rate legislation, internal improvement measures, regulation of industrial combinations and tariff bills. Yale gave him the degree of M.A. in 1901. For years Senator Newlands' chief interest had been in America's railway transportation lines and in the development of national waterways, both for transportation and for greater fertility of land. He was regarded as the pre-eminent expert on these matters. As author of Newlands Act, which provided a plan of land improvement in the arid West by development of waterways, he gained celebrity. For a long time he pressed legislation for the expenditure of many millions of dollars for waterways and irrigation improvement. In his railroad legislative work Senator Newlands enjoyed the closest confidence of President Wilson and was regarded as the administrative spokesman on such matters in the Senate. He was an earnest Democrat, but he regarded himself wholly as a public servant, and was one of the staunchest supporters of President Wilson in the Senate. On 24 Dec. 1917 he went to the Capitol to take up work in connection with an investigation by the Senate Interstate Commerce Committee, of which he was chairman, and was stricken in his office, dying shortly afterward.

NEWLANDS ACT. See **ARBITRATION, INTERNATIONAL.**

NEWMAN, Albert Henry, American Baptist clergyman and educator: b. Edgefield County, S. C., 25 Aug. 1852. He was graduated at Mercer University, Georgia, in 1871, and from the Rochester Theological Seminary in 1875. He became a college professor, and in 1881-1901 filled the chair of church history at McMaster University, Toronto, Ont., and 1901-07 held a professorship at Baylor University, Waco, Tex. From 1907 to 1913 he was professor of church history and dean of the faculty of the Southwestern Baptist Theological Seminary. He was professorial lecturer in the University of Chicago, 1905-12. Since 1913 he has been professor of church history in Baylor University. He was a contributor to the third edition of the 'Hauck-Herzog Realencyklopädie für Protestantische Theologie und Kirche' and to 'Der Protestantismus am ende des 19 Jahrhunderts,' to Hastings 'Dictionary of Christ and the Gospels' and 'Dictionary of Religion and Ethics,' etc. He has written 'The Baptist Churches in the United States' (1894); 'A Century of Baptist Achievement' (1901); 'Manual of Church History' (1900-03). He also translated and edited Immers' 'Hermeneutics of the New Testament' (1877). He was department editor for church history of 'The New Schaff-Herzog Encyclopedia of Religious Knowledge,' etc.

NEWMAN, Allen George, American sculptor: b. New York, 28 Aug. 1875. After receiving his education in the City College of New York and at the National Academy of Design in the same city, he devoted himself to sculpture. Among his numerous works are 'Night and Day' for the Harriman Bank, New York; 'Henry Hudson Monument,' erected by Colonial Dames of America at 72d street and Riverside Drive, New York; 'Joel Chandler

Harris Monument,' Atlanta, Ga.; 'Monument to the Women of the South,' Jacksonville, Fla.; 'General Philip Sheridan Monument,' Scranton, Pa.; 'General Oates, ex-Governor of Alabama,' Montgomery, Ala., and 'General Stirling Price,' Keytesville, Mo. He also made a bronze group, 'The Triumph of Peace,' Atlanta, Ga., and 'The Hiker,' a Spanish-American War soldier, Providence, R. I. Mr. Newman is a member of the National Sculpture Society, the Architectural League, the Union Internationale des Beaux Arts et des Lettres, and many other societies and clubs.

NEWMAN, Francis, English colonial governor in America: b. England, about 1600; d. New Haven, Conn., 18 Nov. 1660. He emigrated to New Hampshire in 1638, settled later in New Haven; was one of the committee which waited upon Peter Stuyvesant in 1653 to demand compensation for injuries received at the hands of the Dutch, and in 1654 became a commissioner for the united colonies. In 1658 he became governor of the New Haven colony, which office he held until his death.

NEWMAN, Francis William, English scholar: b. London, 27 June 1805; d. Weston-super-Mare, Somerset, 4 Oct. 1897. He was graduated at Worcester College, Oxford, in 1826; was Fellow of Balliol in 1826-30. Unable to subscribe to the 39 articles he withdrew and went to Bagdad as a missionary; became professor of classical literature in Manchester New College, York, in 1840; was professor of Latin at University College, London, 1846-69, and was made principal of University Hall, London, in 1848. A brother of Cardinal Newman (q.v.), the thought and faith of the two wholly diverged, the former accepting and the latter rejecting the entire historic basis of Christianity while retaining deistic belief. Francis made important contributions to the religious thought of his time. His 'Phases of Faith' (1850), an autobiographical narrative of his religious changes, excited much controversy and was undoubtedly his best-known writing; but 'The Soul: Its Sorrows and Aspirations' (1849), a singularly penetrating analysis of man's relations with God, shows him at his best. In 1876 he joined the British and Foreign Unitarian Association, of which he became vice-president in 1879. His further writings show the remarkable versatility of this liberal-minded but crotchety man, and treat of education, politics, religion and social questions. An interesting experiment was his 'Hiawatha Translated into Latin' (1862). Consult his 'Memoir and Letters,' edited by Sieveking (1909).

NEWMAN, John Henry, English author, theologian, preacher and cardinal in the Roman Catholic Church: b. London, England, 21 Feb. 1801; d. Edgbaston Oratory, Birmingham, England, 11 Aug. 1890. Newman was the eldest of six children of John Newman, a London banker, from whose family Newman inherited the taste for music which distinguished him. The family was of Dutch origin and had come to England in the latter part of the 17th century. Newman's mother, Jemima Fourdrinier, was of French Huguenot origin. From her he received a religious training of Calvinistic tendency, and was early brought up with a thorough knowledge of the Bible, which it is

said he almost knew by heart. Newman, who was a precocious boy and wrote much verse and prose, describes himself in the 'Apologia' as an imaginative and superstitious child. From the writers who most influenced him in his youth—particularly Law and Thomas Scott—he obtained two important beliefs that clung to him through life, the idea of eternal punishment and a belief in the necessity of dogma. When about 16 he became convinced that it was the will of God that he lead a single life.

Newman entered Trinity College, Oxford, in his 16th year, took his degree in 1820, and was elected a Fellow of Oriel in 1822. Here he came under several distinct influences, which had a good deal of effect on his career. From Bishop Butler's 'Analogy,' which he read about this time, he gleaned the principles, which ever after characterized his work and on which he wrote much, that revealed religion as manifested in outward institutions is the symbol of the natural religion underlying—an idea that was in accord with his boyish dreams—and that "probability is the guide of life." The strong personal influences were Dr. Hawkins, Provost of Oriel, to whose teachings Newman says he owed the habit of caution in statement and the weighing of words, and, among other doctrines, that of the value of tradition; Dr. Whately, who for a time somewhat arrested Newman's spiritual growth and developed his reasoning power; and his intimate friends, John Keble and Hurrell Froude, spiritual enthusiasts and haters of liberalism. His studies for 'The Arians of the Fourth Century' (pub. 1833) which he began at Oriel, tended to confirm his belief that "antiquity was the true exponent of the doctrines of Christianity and the basis of the Church of England," and stimulated his innate belief in the existence of spirits, good and evil, which he regarded as the causes of physical phenomena. These studies also undoubtedly laid the foundation for the course of reasoning which subsequently led him into the Church of Rome. Meanwhile, his progress in his profession had been rapid. In 1824 he took orders and was ordained curate of Saint Clement's Church, Oxford. The following year he became vice-principal of Saint Alban's Hall under Dr. Whately, a position which he gave up in 1826 to become tutor at Oriel. In 1828 he was appointed vicar of Saint Mary's, his only permanent position while a member of the Anglican Church; for in 1829 he broke with Whately because of his dislike for the tendency of the latter toward liberalism, and a year or two later retired from his tutorship at Oriel, for the reason that Dr. Hawkins, who then came into power, looked upon him and his friends, Keble and Froude, as too extreme in their views regarding the need of conformity to a more rigid order of things.

Throughout this period Newman was gradually becoming alive to the conviction that he had a special mission to perform, and further stimulus was added by the French Revolution of 1830 and the struggle in England which culminated in the Reform Bill of 1832. These tendencies toward liberalism he viewed with growing distrust. Not, however, till the close of his voyage with Froude to the south of Europe in the winter and spring of 1832-33 (during which he wrote many poems, including 'Lead Kindly Light') did the conviction be-

come urgent. Taken so very ill in Sicily on his return voyage that his servant despaired of his life, he was nevertheless convinced that he should not die; he kept saying to himself "We have work to do in England." Hurrying thither as soon as his health permitted, he and his friends at once began the Oxford Movement (q.v.).

The object of this movement was in general the upholding of the ideal of primitive Christianity against the assaults of liberalism. It was pursued with great earnestness by Newman and his friends, Froude, Keble, Pusey, Rose and others, and the means were the 'Tracts for the Times,' of which Newman was chief editor and author. He speaks of himself as occupying a modest position, but he was in reality the head of the movement. He himself held confidently to three principles which he endeavored to inculcate: the necessity of dogma in combatting liberalism; the existence of a visible church, "with sacraments and rites which are the channels of invisible grace"; and the belief that the Roman Catholic Church and the Pope were evil and anti-Christian. The first two of these beliefs he retained till the end of his life; it was in regard to the last that his views were completely altered and upon that belief his subsequent history turned. For Newman the Tractarian movement had two phases: up to 1839 he wrote in the spirit of full conviction and confidence; from then till the publication of the famous Tract 90 in 1841 there was a growing consciousness of the unsoundness of the arguments that he had been using against Catholicism. The chief task in the first period was the definition of the so-called "*Via Media*" in which the Tractarians endeavored to establish the true position of the church between Romanism and Liberalism—to construct, in Newman's words, "a possible road between a mountain and a morass, to be driven through formidable obstacles, if it is to exist, by the boldness and skill of the engineers." The principal book in which the doctrine is expounded is 'The Prophetical Office of the Church Viewed Relatively to Romanism and to Popular Protestantism' (1837). By 1839 the soundness of his position seemed to be established; but his studies had, unconsciously to himself, laid the train for the overthrow of what he had been advocating, and these doubts took shape during the next two years. The argument from Antiquity with which he had supported the *Via Media* turned out to be an equally good argument for the Catholic Church. He also made the discovery that in church history there had been *via medias* before; the various early sects of heretics had in his new view occupied much the same position as the Anglican Church. He was impressed by the fact that the early fathers whom he invoked in support of his effort at true compromise would inevitably, if alive, have sided with Rome, and his imagination—always a strong influence in his reasoning—was haunted by the words "*Securus judicat orbis terrarum*," which seemed to make nugatory all schism. The result was that he grew far less hostile to the Catholic Church, and with Tract 90 the movement against it came to an end. The main point of that tract was that the Thirty-nine Articles of the Anglican Church had originally been framed, for political rather than religious

purposes: they were designed to allow good Catholics to become members of the Anglican Church with mere loss of their allegiance to the Pope. If that was the case, then the Anglican had no better doctrinal support than the Roman Church.

From that time Newman regarded himself as practically dead to Anglicanism. In the storm of indignation which the tract evoked he did not, however, immediately retreat. Preferring to think the matter over carefully, he kept his living at Saint Mary's till 1843, and in that same year retracted the many hard things he had said about Rome. Two years later, in October, he entered the Roman Catholic Church, and early in 1846 left Oxford for good. After over a year in Rome (1846-47), he founded the Oratory of Saint Philip Neri, at Edgbaston, Birmingham, where, with the exception of four years (1854-58) spent in Dublin as rector of a new Catholic University, he remained until his death.

Though condemned as an apostate by common Anglican consent, and though living a very secluded life, Newman almost at once benefited by the change. Not only did he feel the peace of security, but his literary genius is said to have ripened wonderfully. Heretofore he had written somewhat tentatively, as one groping; now he expressed himself with sureness and an unwonted command of expression. His writings during the first 18 years after his conversion, nearly all in support of Catholicism, include such various types as his 'Discourses Addressed to Mixed Congregations' (1849); 'Lectures on Anglican Difficulties' (1850), and 'Lectures on Catholicism in England' (1851); various of the essays collected in 'Historical Studies'; two novels, 'Loss and Gain' (1848) and 'Callista' (1855); and what is in many respects his masterpiece of treatment, 'The Idea of a University,' a series of discourses which he delivered at Dublin in 1852 on the founding of the Roman Catholic University.

In 1864 occurred the controversy with Kingsley, which marks an epoch in Newman's life and in the position of the Catholics in England. Kingsley had said that the Roman clergy had little regard for truth, and had cited Newman as an advocate of cunning. Newman naturally asked for his evidence. Kingsley, in *Macmillan's Magazine*, where his first article had appeared, replied that he had mistaken Newman's tone, and apologized. Newman, reasonably dissatisfied with Kingsley's failure to produce the specific evidence, published the whole correspondence. Kingsley thereupon replied in a vigorous pamphlet entitled "What, then, Does Dr. Newman Mean?" in which he charged Newman with equivocation and cited all the instances he could find in Newman's life and works to prove his point. The merits of the controversy are as yet unsettled, though now of only historical interest; views would probably still range from extreme support of Newman to such words as those of Huxley, "That man is the slipperiest sophist I have ever met with. Kingsley was entirely right about him." ('Letters,' II, p. 240.) The effect of the controversy was the publication by Newman of the 'Apologia pro Vita Sua.' This, which appeared serially between 21 April and 2 June, gave the key to Newman's life as an internal state

The effect of the 'Apologia' was to temper in a great measure the feeling between the Catholics and the Anglicans, and it gave Newman the honorable position of peacemaker. From that time on he occupied a high place in England and received many dignities. In 1877 he was elected honorary fellow of Trinity College, Oxford, and two years later was created cardinal by Pope Leo XIII. Two works are to be especially noted, 'An Essay in Aid of a Grammar of Assent' (1870), in which Newman attempted to expound systematically the logic of belief aside from exact proof, and 'The Dream of Gerontius,' written shortly after the 'Apologia,' in which he delineated in poetical form the yearning of a soul toward certitude and truth.

These three books indicate where the place and power of Newman lie. His position is probably to be determined not by his intellectual contributions but by his personality which is of a high, noble and persuasive type, and which is expressed in a style of unsurpassed skill and delicacy. As a contributor of ideas and new truth, he is not so important. As a theologian, his life-long beliefs and teaching—that the world is controlled by the powers of darkness, that God is the only holy thing, that the Church is the only true revealer of God—in no wise differ from good Catholic opinion. The great argument on which he ultimately based all his claims, that of probability, that we act not from certainty but from states of certitude, that personality which can induce states of certitude is a better guide than strict reason—the basis of this he got from Bishop Butler, nor did he take into consideration the fact that his argument would allow anybody to believe anything at all, provided he could summon enough certitude in support of it. Doubtless the mass do use just such sanctions, and Newman has certainly, both in life and in work, put the argument as well as it has ever been put, but the method is wholly opposed to scientific proof, and it is easy therefore to see the reason for the view of such men as Huxley. The truth of the matter probably is that Newman, with all his training in logic, really had little regard for strict evidence; his course during the Oxford movement shows that he argued from predispositions and predilections, and his conversion was in part at least the result of evidence supplied solely by his imagination. But as a gracious and winning personality his place is of the highest, as is his power of expression. See *APOLOGIA PRO VITA SUA*; *DREAM OF GERONTIUS*; *IDEA OF A UNIVERSITY*.

Bibliography.—The chief sources of information are, among Newman's many works, the 'Apologia,' and 'The Letters and Correspondence of J. H. Newman,' edited by his sister, Mrs. Anne Mozley. The best 'Life' is that by Wilfred Ward (1912), and it is based on his private journals and correspondence. Lives and studies are those of H. J. Jennings ('Cardinal Newman, The Story of His Life'); R. H. Hutton ('Cardinal Newman'); William Barry (in 'Literary Lives'). Materials for a complete study are scattered in various books as Church's 'The Oxford Movement,' Mark Pattison's 'Memoirs,' Abbott's 'Philomythus' and 'The Anglican Career of John Henry

Newman,) and a score of others (consult a long list in the 'Dictionary of National Biography.') The more recent works, Brémond's 'The Mystery of Newman'; Sarolea's 'Cardinal Newman and his Influence on Religious Life and Thought,' and Thoreau-Dangin's 'English Catholic Revival,' may be recommended. The 'Index' to Newman's works, by Joseph Rickaby (1914), is valuable not only as an index, but for the illustrations it affords of his intellectual and spiritual development. There is an excellent short study of the conversion and the theology of Newman by R. M. Lovett (*Harvard Monthly*, Dec. 1892, Jan. 1893).

WILLIAM T. BREWSTER,
Professor of English, Columbia University.

NEWMAN, John Philip, American Methodist bishop: b. New York, 1 Sept. 1826; d. Saratoga, N. Y., 5 July 1899. He studied for the ministry and in 1849 was ordained. After filling various charges he preached in New Orleans in 1864-69; held three times (1869-72, 1876-78, 1885-87) the pastorate of the Metropolitan Methodist Church in Washington, D. C., and was chaplain of the Senate for three sessions. He was appointed by President Grant inspector of United States consulates in Asia in 1873, in 1879 was called to the Central Church, New York, and from 1882-84 was pastor of Madison Avenue Congregational Church. In 1888 he was elected bishop. He delivered the funeral oration on General Grant. His eloquence was of a highly ornate kind. He wrote 'From Dan to Beersheba' (1864); 'The Thrones and Palaces of Babylon and Nineveh from the Persian Gulf to the Mediterranean' (1876); 'Christianity Triumphant' (1884); 'Evenings with the Prophets on the Lost Empires' (1887); 'The Supremacy of the Law' (1890); 'Conversations with Christ' (1901).

NEW MARKET, Canada, town in York County, Ontario, 34 miles north of Toronto on the Holland River, the Grand Trunk Railroad and the Trent Canal extension. It is connected to Toronto by an electric railroad. Places of interest are the Park, the Fairy Lake and 'David's Temple' in the suburb of Sharon. The Friends' College is situated here. Newmarket is an enterprising manufacturing town and produces flour, lumber, office fittings, leather, clothing and wooden-ware. Pop. 2,996.

NEW MARKET, England, a market town in Cambridgeshire, 14 miles northeast of Cambridge on the Bury branch of the Great Eastern Railway. A part of the town is in Suffolk. Newmarket, called the "Metropolis of the Turf," has been celebrated for its horse-races from the time of James I when there was hawking also. Charles I instituted the first cup race, and a fine palace was built on the site of the lodge of James I for the use of Charles II when he came to the races. The market-house and the celebrated Jockey Club are the chief buildings. The town is full of residences belonging to patrons of the turf and racing and training stables. The racecourse lies southwest of the town over Newmarket Heath. It has a full extent of four miles, but is divided into various lengths to suit the different races. The course is intersected by the great earthwork called the Devil's Ditch (also Saint Edmund's Dyke). It is five miles long—the largest of the four im-

portant dykes or entrenchments which marked, at different periods, the boundary lines between the kingdoms of East Anglia and Mercia. Eight race-meetings are held every year, the best known of which are the "Thousand Guineas" (April) and the "Cesarewitch" (October). On the outskirts of the town, toward Bury, is the Fairstead, or exercising ground, where the trial gallops of young horses take place daily. Near this is the well-known Warren Hill. In the neighborhood of Newmarket, Roman ruins have been found. Of its two churches, Saint Mary's, perpendicular style, is the most interesting. It is in Suffolk. Pop. about 10,482. Consult Hore, J. P., 'History of Newmarket and Annals of the Turf' (2 vols., London 1886).

NEWNAN, nū'nān, Ga., city, county-seat of Coweta County, on the Central of Georgia and the Atlanta and West Point railroads, about 38 miles south by west of Atlanta. It is in a productive agricultural region in which cotton and fruits are extensively cultivated. The principal industrial establishments are cotton mills, grain elevators, cottonseed-oil mills, machine shops, flour mill, tannery, fertilizer works, a large plant for manufacturing boilers, engines, presses and mill machinery, fertilizer works and an ice factory. There is a fine courthouse and a Carnegie library. The city owns the waterworks and electric plants. Pop. 7,037.

NEWNES, nūnz, SIR **George**, English journalist: b. Matlock, 13 March 1851; d. Lynton, Devonshire, 9 June 1910. He was educated in London and entered journalism. He was the founder of *Tit-Bits*, a very successful weekly, the nature of which is indicated by its title; and he also founded the *Strand Magazine* and was proprietor of the *Westminster Gazette*. He was member of Parliament (Liberal) for the Newmarket division of Cambridgeshire, 1885-95, was created a baronet in 1895 and returned to Parliament from Swansea 1900-10. He applied much of his wealth to public purposes.

NEWNHAM (nūn'am) **COLLEGE**, England, an institution for the higher education of women at Cambridge, founded in 1871 and incorporated in 1880. Ordinarily no students are admitted under 18 years of age; the course of study corresponds with that of Cambridge University. There are a number of exhibitions and scholarships connected with the college, which is conducted on the same lines as Girton (q.v.). The faculty numbers about 26 and there is an average attendance of over 200 students.

NEWPORE, Fort, a former Revolutionary fortification on Ward Creek, near Oneida Lake, N. Y.

NEWPORT, nū'pōrt, **Christopher**, English sea captain: b. about 1565; d. 1618. In 1592 he commanded a ship in the West Indian expedition; sailed to Virginia in 1606, 1607, 1609 and 1611, was wrecked on the Bermudas in the third of those voyages, but made his way to Virginia after many adventures recounted by Jourdain in the 'Discovery of the Bermudas,' which Shakespeare may have used in writing the 'Tempest.' In 1612 he entered the employ of the East India Company, for whom he made several very successful voyages.

NEWPORT, **George**, English naturalist: b. Canterbury, 4 July 1803; d. London, 7 April

1854. He was educated at the London University and became a surgeon, but devoted much time to entomology, in which science he made valuable discoveries. He wrote 'Observations on the Anatomy, Habits, and Economy of *Athalia Centifolia*' (1838); 'Catalogue of the Myriapoda in the British Museum' (1856), etc.

NEWPORT, Ark., city and county-seat of Jackson County, 85 miles northeast of Little Rock, on the Chicago, Rock Island and Pacific, the Saint Louis, Iron Mountain and Southern, and on the White River railroads. It is situated in a cotton-growing district and its industries are connected mostly with this crop, consisting of cotton and oil mills, lumber mills, iron foundry and stave and handle works. Pop. (1920) 3,771.

NEWPORT, England, a town of Monmouthshire, on the Usk, 134 miles by rail west of London. It is one of the great trading ports communicating with the Bristol Channel. As one of the principal outlets for the produce of extensive collieries and iron and steel works in the vicinity, it has extensive dock accommodation covering over 126 acres, railway and ship-building plant, and a transporter bridge across the river. Its public buildings are all of modern erection and include town hall, market hall, county offices, public baths, museum, art gallery and technical institute. Its most ancient buildings are the remains of a 12th century castle and the church of Saint Woollos, a large edifice partly of Norman date. Pop. 83,691.

NEWPORT, Ky., city in Campbell County, at the confluence of the Ohio and Licking rivers and on the Louisville and Nashville and the Chesapeake and Ohio railroads. Cincinnati, on the Ohio, and Covington, on the Licking, are opposite Newport. The city was settled in 1791, in 1795 was incorporated and in 1850 was granted a city charter. It is a popular residential city for Cincinnati business men. It is in an agricultural region and farm products are among its most important shipments. The chief manufacturing establishments are sheet-iron works, carriage works, watch-case factory, steel plant, fly-screen works, lithographing plant and air-crome decorating works. It has large coal and brick yards and considerable river trade. Fort Thomas, a government military post, is on an elevation near the city. Some of the prominent buildings are the city hall, courthouse, post office, the banks, a Masonic temple, the churches and schools and the library. It is the seat of Mount Saint Martin's and Immaculate academies and it has good public and parish schools and a public library. The city now has commission government. It was formerly under the charter of 1894, which provided for a mayor who held office for four years and a council. The mayor appointed the police and firemen and the members of the water commission, and, subject to the approval of the aldermen, the superintendent of public works and the city auditor. The council elected the bridge commissioners. The board of education is elected by the people and the members hold office two years. The waterworks is owned and operated by the municipality. Pop. 29,317.

NEWPORT, N. H., town, county-seat of Sullivan County, on the Sugar River and on the Boston and Maine Railroad, about 35 miles

in direct line northwest of Concord and 45 miles northwest of Manchester. Its scenery and climate make it a favorite summer resort. It is in an agricultural and grazing region and the good water power contributes to its industrial prosperity. Its chief manufactures are woolen goods, agricultural implements, shoes, lumber and lumber products, clothing and dairy products. The Richards Library and Museum, the Carrie F. Wright Memorial Hospital and a high-class modern hotel are notable buildings. It is within six miles of Lake Sunapee, one of the most beautiful lakes in the world, and within three miles of the famous Corbin's Blue Mountains Forest Park. "Good roads" is one of the town's slogans and its streets and sidewalks are among the best for a town of its size in the State. The city owns and operates the waterworks. Pop. 4,400. Consult Wheeler, 'The History of Newport, N. H.' (Concord 1879).

NEWPORT, R. I., city, port of entry, county-seat of Newport County, in Rhode Island, on Narragansett Bay, and on the New York, New Haven and Hartford Railroad, about 30 miles south of Providence. It has daily steamer communications with Providence, New York, Fall River and other ports. It is a famous summer resort and in the season its facilities for transportation are much increased. Its beautiful scenery, equable climate, ease of access by land and water from New York, Boston and other large cities, make it a favorite watering place. Its occupancy by people of great wealth, who have built summer residences costing millions of dollars, has made it fashionable and exclusive. In 1639 Newport was settled by Roger Williams and later Anne Hutchinson and other refugees, who for religious convictions had been expelled from Massachusetts by the Puritans, came to Newport. At first Newport was independent in government, but in 1644 Roger Williams obtained a patent from the British Parliament under which all the colonies in what is now the State of Rhode Island were united under the name of "The Incorporation of Providence Plantations in the Narragansett Bay in New England." The charter gave much dissatisfaction and in 1663 was changed to a charter that continued in force until 1843. (See DORR'S REBELLION). A public school was established in Newport in 1840. From the beginning the place was a trading port of importance; its commerce was greater than that of New York in 1769-70. One of the first acts of resistance against Great Britain took place at Newport when the British sloop *Liberty* was destroyed here, while engaged in enforcing obnoxious smuggling laws. The British took possession of Newport 6 Dec. 1776 and held it for two years. The shipping of the place and the general trade were nearly destroyed during the Revolution. The British soldiers burned in all about 475 houses. In 1780 Rochambeau and his troops from France made Newport their headquarters. In 1784, the year after the Revolutionary War had closed, Newport was incorporated; but in 1786 it surrendered its charter and was not reincorporated for 77 years.

It is claimed by some historians that Newport and other parts of the United States were discovered by Northmen as early as the 11th

century. The "Old Stone Mill" in Touro Park is pointed out as a relic of the days of the Northmen; but it is now generally believed that this mill was built in the 17th century. Newport was one of the capitals of the State until 1900. Bishop Berkeley lived in Newport from 1729 to 1732 and here wrote his ode on Western progress and part of his 'Alciphron.' William Ellery Channing and Commodore M. C. Perry were born in Newport. Some of the historic places are the State House built in 1742; the city hall built in 1763; Redwood Library, 1748; Trinity Church (P. E.), 1725; the headquarters of the British army (Sayer House), in 1780. One of the oldest newspapers in the United States still in existence is the *Newport Mercury*, established by James Franklin in 1758. The oldest part of the city is around the harbor; the modern part, with its magnificent mansions, surrounded by well-kept lawns, is toward the ocean. Overlooking and guarding the harbor are Fort Greble and Fort Adam. Some of the attractions other than those mentioned are the long beaches, the bathing places, the "Hanging Rocks," the 12-mile Ocean Drive, Purgatory (a rocky fissure 50 feet in depth), the Cliff Walk and the Spouting Rock (when the water is disturbed by a storm it is forced through an opening in this rock). It has a United States torpedo station on Goat Island and a United States Naval Training Station and War College on Coaster Harbor, also a naval hospital (1897). The city has many parks, fountains and monuments which are works of art. It is the seat of Saint George's and Cloyne House schools and Saint Mary's Academy. A valuable collection of relics are in the Newport Historical Society building; there are several libraries, the People's, Redwood and others.

It still has a large fish trade, but the city is now known for its society life and its industries and commerce are of little value. Pop. 30,472. Consult Arnold, S. G., 'History of the State of Rhode Island' (2 vols., New York 1860); 'Rhode Island Colonial Records'; Brooks, 'The Controversy Touching the Stone Mill'; Greene, 'The Providence Plantation'; 'Newport in the Revolution,' an article in the *New England Magazine*; Mason, G. W., 'Reminiscences of Newport' (Newport 1884); Stone, E. M., 'Our French Allies' (Providence 1884).

NEWPORT, Vt., village, county-seat of Orleans County, on Lake Memphremagog, and on the Boston and Maine and the Canadian Pacific railroads, about 50 miles in direct line north by east of Montpelier. In the summer season it has regular steamer communication with all the villages and towns on the lake. It is a favorite summer resort on account of its climate, the scenery in the vicinity and the opportunities for fishing. Its trade is chiefly in farm products; its manufactures are lumber veneer of all kinds, large overall factory and creamery. It has fine church and school buildings and the Goodrich Memorial Library which contains 9,000 volumes. Pop. 4,976.

NEWPORT NEWS, Va., city and port of entry in Warwick County, on the James River and Hampton Roads, and at the terminus of the Chesapeake and Ohio Railroad, situated 70 miles southeast of Richmond and 14 miles north of Norfolk. The city lies in the centre of a

rich vegetable and fruit country. It is connected with Hampton and Old Point Comfort by electric railways. In the heart of the city facing the James River is Casino Park, which has become a popular resort. With several foreign and coast lines of steamships sailing hence, and with a fine harbor and excellent shipping facilities, Newport News has very recently become an important port and the centre of large commercial interests. The foreign trade in 1916 amounted to about \$79,000,000; the exports amounting to about 90 per cent of the above. The foreign commerce of the port is largely carried on by the Chesapeake and Ohio Railroad and the United States Shipping Company, making direct connection with England and the Continent. The city has become fourth in the United States in the shipment of grain. Here is an extensive shipbuilding plant, one of the largest in the world, giving employment to over 10,000 workmen; three dry-docks, 600, 700 and 900 feet long; two grain elevators with a capacity of 2,850,000 bushels; wood-working mills, ice factories, lumber mills, iron works, shoe factory, coal wharves, shirt factory and brewery. Newport News is governed, under its original charter of 1896, by a mayor, elected every four years, common council, consisting of 16 members, and a board of eight aldermen. The city has an improved system of waterworks and electric light and gas plants. Newport News is a young town practically lacking in history. It was first laid out in 1882 and incorporated in 1896. Its growth has been very rapid; the population in 1890 was 4,449; in 1917 it was 23,674; in 1920 it was 35,596.

NEWRY, nū'ri, Ireland, seaport and parliamentary borough in County Down and Armagh, on the Newry River, 38 miles southwest of Belfast and 73 miles north of Dublin by the Great Northern Railway. It is also on the Newry Canal at the head of Carlingford Lough and is connected also by canal with Lough Neagh. The place dates from 1131. In 1175 an abbey was founded here by Maurice McLoughlin, king of Ireland, and in 1543 this abbey was converted into a collegiate church for secular priests. It was dissolved by Edward VI, who granted it to Sir Nicholas Bagenal, marshal of Ireland. Bagenal made it his residence and laid the foundations of the town's prosperity. The castle, erected by De Courcey, was taken by Edward Bruce in 1318. In 1689 Newry was set on fire by the Duke of Berwick retreating before Schomberg. James I and James II granted charters to the town. Newry is handsomely built and the situation is striking as it lies in a narrow valley surrounded by mountains. The western part, called Ballybot, is connected with the older town by four bridges over the canal and four over the tidal water. Newry is one of the most important ports of the province of Ulster. It admits vessels of 2,000 tons to Victoria Docks, three miles from town. Vessels drawing 15 feet can ascend the canal to the Albert Basin. In connection with several sub-ports further down the Newry River it is the outlet for a large trade, particularly with Liverpool and Glasgow, in cattle and agricultural produce. Flax-spinning, weaving, tanning and granite polishing are the chief industries. The town possesses rope and sailworks, breweries, distilleries, tanneries and

flour-mills. Fine granite is quarried in the neighborhood. Pop. 12,587.

NEWS-LETTER, a popular name applied to the printed sheets or letters issued weekly in the early part of the 17th century, the news for which was collected in the coffee-houses. Originally they were literally letters of news written by professional newswriters and sent by them to their employers weekly. Many early printed newspapers took News-Letter as a title, as the *Boston Newsletter*, etc.

NEWSPAPER, a publication devoted primarily to daily sheets publishing the news as to current events. The term is also construed to cover semi-weekly and some weekly papers of the same class. Along with the news, newspapers customarily print comment, criticism or discussion of such events by editors and contributors. As such, the newspaper has become one of the most powerful factors in modern existence. Not only does it serve as a distributor of every form of knowledge, but it also guides the opinion of great masses of people, and more important still, it becomes the voice of the people; so that the demands of a newspaper with a large clientele are listened to attentively by all public officials from the highest to the lowest.

As a rule, newspapers are conducted for the money to be obtained by their publication. In a few cases they are operated by their owners as organs of their individual expression, or in the special interest of some political movement.

The cost of making a newspaper is prodigious. There are heavy charges for cable and telegraph news; a large staff of local newsgatherers must be maintained; special correspondents at points of great activity must be provided; the office forces must necessarily be of high-grade minds — not to mention the intricate and expensive machinery required to actually produce the printed sheet in the briefest possible period. The great weakness of the newspaper is its dependence upon its advertising patronage for its livelihood, the price at which it is sold to readers being scarcely more than the cost of distribution. Under these conditions it is not likely that the newspaper will print material which would tend to injure the business of the advertisers which support it, so that to some degree at least the advertising may be said to control the policy of the paper.

The larger daily morning papers usually publish two editions; the first for suburban distribution, the second for city circulation. The larger evening dailies print several editions, the first about noon, or even before, and three or four later editions, the last leaving the press about six o'clock. Later news of great importance or interest is handled in an "Extra." The principal dailies issue a Sunday edition made up of six or eight classified sections — News, Editorial, Dramatic, Sports, Household, Special Articles, etc.

Much of the general news, foreign and domestic, is gathered and transmitted to the individual papers by press associations. This service is distributed to a large number of subscribing members of the association, and the cost of gathering it is thus minimized. In addition to this association service, most of the larger papers have their own correspondents

at centres of important news and receive daily a very considerable special service by telegraph.

Making the Newspaper.— In the making of a newspaper the fundamental work is literary. The control of the character of the material prepared is vested in the editor-in-chief, who is in some cases also the principal owner. Upon him is laid the responsibility for the heads of the departments who are immediately in charge of the production of the literary material of the paper. The editorial writers are directly under the editor-in-chief and do their work in accordance with his suggestions or instructions. The managing editor is an executive. He directs the make-up of the paper, deciding what shall go in and the space it shall occupy. He calls upon the several editors for the material he may need to fill out the vacant spaces. In the actual construction of the paper, he or his assistant is on duty until the last page form is complete. In some instances the managing editor and the editor-in-chief are one. The city editor is in charge of the collecting of local news through his staff of reporters, who may number from 10 to 50. He assigns certain reporters to particular tasks, so as to "cover" all events likely to be of public interest. In the case of a morning paper the city editor is usually succeeded by a "night editor" who remains on duty until the forms are on the press. In the larger newspaper offices there is also a news editor, who receives and edits the telegraph and cable news. There may also be a political editor, whose province it is to write editorials in the interest of the political party with which the paper is affiliated; and a financial editor who records and comments upon the fluctuations in market values of stocks, bonds, etc. There must be also a sport editor, a dramatic editor and a musical editor, whose duties are sufficiently indicated by their titles, the two latter holding as well the positions of critics. The literary editor has charge of the strictly literary articles, book reviews, etc.

All the copy passes from the various editors to the "desk" where it is read by responsible assistants to the editor-in-chief, corrected as to character of statement, form and, if need be, spelling, punctuation, etc. From the desk it goes to the composing-room and is then under the direction of the superintendent or foreman. He is essentially a mechanic, whose duty it is to construct in type the literary material furnished him. In the city offices and in many of the larger country offices typesetting machines are in use, though a great deal of type is still set by hand. The typefounders report a continually increasing demand for their product despite the spread of the typesetting machines. The type as set, by whatever means, is assembled into page forms by the foreman under the direction of the managing editor. When the page is satisfactorily filled, the printing may be done directly from the type for a small issue. In the offices of the large papers the page forms are stereotyped and the printing done from the plate thus made. The pages are assembled for one side of the sheet on which the paper is printed in one part of the press and for the other side in another part, the web of paper passing first one set of page forms and then the other. When printed on both sides it passes to the folding machinery which folds and cuts apart

the individual papers and counts them at the delivery shelf. They are then delivered to the circulation manager whose business is to sell as many of them as possible. He has his force of delivery automobiles which hasten out on their various routes, leaving the bundles with news dealers or distributors.

The business department of the paper attends to the financial part of the combination, and with this department is associated the advertising editor, whose copy also goes independently to the composing-room, or to a separate jobroom, coming back in the form of type to the superintendent and the managing editor. With all its seeming complexity the various operations are carried on at top speed with perfect accord and with rarely a serious hitch.

Various commercial enterprises have arisen in connection with newspaper making. Some of these are known as "syndicates" who buy literary material from authors and sell it to newspapers in that form; or they may stereotype it and sell the "plate-matter," as it is called, ready for placing it on the press. Other syndicates or co-operative bureaus make up and sell newspaper sheets printed with items of general interest on one side. These are known as "patent insides" and are used very largely by country papers, which by their use have their typesetting reduced to half. The "patent insides" generally carry sufficient advertising to cover their cost and therefore are sold at little more than the cost of the paper they are printed on.

The total number of newspapers and periodicals published in the world at present is estimated at about 60,000, distributed as follows: United States and Canada, 26,360, of which about 2,600 are dailies and 650 semi-weeklies; Germany, 8,000; Great Britain, 8,000; France, 4,300; Japan, 2,000; Italy, 1,500; Austria-Hungary, 1,200; Asia (exclusive of Japan), 1,000; Spain, 850; Russia, 800; Australia, 1,000; Greece, 600; Switzerland, 450; Holland, 300; Belgium, 300; all others, 1,000. Of these more than half are printed in the English language. These figures were correct before the war. Since that outbreak many publications have ceased, but it may be presumed that they will generally resume upon the return of normal conditions. A detailed history of the newspaper in America will be found under *NEWSPAPERS, AMERICAN*.

Early Roman Bulletins.—The newspaper had its origin several centuries before the Christian era. The Romans published the *Acta Diurna*, the *Acta Publica*, the *Acta Senatus* and other journals. The *Acta Diurna* was a bulletin in which accounts were given of the progress of the imperial arms. The intelligence was communicated by the generals who received it from the officers under their command, and thus the contents became known throughout the army. The *Acta Diurna*, however, recorded other than military matters, such as trials, punishments, deaths and sacrifices. The *Acta Senatus* contained accounts of the various matters brought before the Senate, the opinions of the chief speakers and the decisions of the house, published regularly by command of Julius Cæsar, as part of the government gazette. The *Acta Publica* was a still nearer approach to the true newspaper form. During the later times of the republic, and

under the empire, it was published daily at Rome by the authority of the government. It contained a register of the births and deaths in the city; an account of the money paid into the treasury, from the provinces and everything relating to the supply of corn, and a kind of court circular, containing an account of the births, deaths, festivals and movements of the imperial family. Such details of public affairs as it was deemed expedient to publish were also included in it. The speeches in the Senate and the public assemblies were taken down by the early Roman short-hand writers called *actuarii*. These, assisted by clerks and notaries, drew up the *Acta* under the superintendence of censors, quaestors and other magistrates. The publication consisted in posting them in some public place, that any one who pleased might read them.

First Printed Journals.—"Ti Chau," better known as *The Peking Gazette*, was probably the first printed newspaper, and is the oldest daily journal in the world. It was first issued about 1340 A.D. The *Gazette* is still in existence, and is an official journal, forming a pamphlet of 20 to 40 pages of coarse paper, printed from wooden types on one side only, and having a colored paper cover. Toward the close of the 15th century, soon after the invention of printing, small sheets, usually in the epistolary form, appeared in Augsburg, Vienna, Ratisbon and Nuremberg. They were called *Relationen* and the *Neue Zeitung*, and gave accounts of the discovery of America and of other important public events, and like modern newspapers they chronicled the more interesting and startling local incidents. The *Notizie Scritte*, published monthly in Venice, in 1562, is said to have been the first Italian newspaper. Its price was a small coin called gazetta; hence the word gazette which came to be the popular name for the modern newspaper. The war which Venice waged in Dalmatia gave rise in 1563 to the custom in Venice of having military and commercial information read at a particular place by those desirous to learn the news, who paid for this privilege. A file of these Venetian papers, covering a period of 60 years, is still preserved in the Magliabecchi Library at Florence.

English Newspapers.—A printed bulletin entitled *Relations* was published in England as early as 1462, and in 1527 there was one called *New Tidings*, but neither of these presented more than a single piece of intelligence. A pamphlet called *The Newes from Spaine* made its appearance in the reign of Queen Elizabeth in order to convey to the people the tidings of the approaching armada from Spain, and the various counter-movements on the part of the British army and fleet. The first newspaper printed in English was published in Amsterdam, 2 Dec. 1620. It was a folio sheet printed both sides; and was issued by the Dutch bookseller Petrus Keerius, and his printer, Joris Veseler. A more pretentious journal was issued in 1622, under the title *The Weekly News from Italy, Germany, etc.*, published by Nathaniel Butter, Nicholas Bourne and Thomas Archer, and this may be regarded as the first specimen of the regular newspaper in England. Numerous other news journals followed, but it was not till the beginning

of the parliamentary wars that the newspaper first acquired political influence. One of these, published in November 1641, under the title of *Diurnal Occurrences, or the Heads of Several Proceedings in both Houses of Parliament*, is noticeable as the first which furnished a report of the proceedings in Parliament. The other papers which followed this were the *English Post*, *England's Memorable Accidents*, *The Kingdom's Weekly Intelligencer*, *The Spy*, *The Parliament's Scout*, *The London Post*, *The Country Messenger*, and were most of them published weekly. In Cromwell's time the principal journals were the *Mercurius Politicus* and the *Public Intelligencer*. The publication of newspapers without license was prohibited in the reign of Charles II, and an office was created called Licensor of the Press. Advertisements first appeared in English newspapers in 1652. The first copy of the *London Gazette* was issued 7 Nov. 1665 at Oxford, whither the court had retired in consequence of the plague then raging in London. It has since been uninterruptedly published twice a week as an official court circular. The first London daily paper was published in 1709 under the name of the *Daily Courant*. At this time appeared Defoe's journal, the *Review*. The first number of the *Tatler* was published on 23 April 1709, and of the *Spectator* on 1 March 1711. Though not properly newspapers in the modern sense of the term, their early numbers contained general news in addition to their other literary matter. In 1712 a tax or stamp-duty was imposed by the government of a half-penny on papers of half a sheet or less, and a penny on papers of a single and above a half sheet. The *London Daily Advertiser* first appeared in 1726, and became afterward celebrated by the publication of the famous "Letters of Junius" (q.v.). The *Morning Chronicle* appeared in 1769 and the *Morning Post* in 1772. The *Times* was first commenced 18 Jan. 1785, under the name of the *London Daily Universal Register*, which was afterward superseded by that of the *Times* on 1 Jan. 1788. It was ably conducted from the first by Mr. Walter, who in 1803 transferred the management to his son. The *Daily News* appeared in 1846, the *Daily Telegraph* in 1855, and the *Daily Standard* in 1857. Others of later establishment are the *Echo*, *Graphic*, *Mail*, *Pall Mall Gazette*, *Westminster Gazette*, etc. The provincial English press began with the *Norwich Postman*, published in 1706, and followed by the *Norwich Courant* in 1714, and the *Weekly Mercury, or Protestant's Packer* (at Norwich) in 1720. The *Worcester Postman* appeared in 1708, the *Newcastle Courant* in 1711, the *Kentish Post* in 1717 and the *Leeds Mercury* in 1718.

Ireland and Scotland.—The first newspaper published in Ireland was the *Dublin News-Letter*, in 1685, followed by the *Dublin Intelligencer* in 1690. The *Belfast News-Letter*, still flourishing, first appeared in 1737. The *Freeman's Journal* commenced in 1763. In Scotland, on 31 Dec. 1660, appeared at Edinburgh the first number of the *Mercurius Caledonius*, which had an existence of only three months. The *Edinburgh Evening Courant* was started in 1718. The *Caledonian Mercury* commenced in 1720 and existed 150 years. The *Edinburgh Gazette* dates from 1699. The first paper published in Glasgow was the *Glasgow Courant*, on

11 Nov. 1715, followed by the *Glasgow Journal* in 1729. The *Edinburgh Scotsman* was first issued in 1817 and the *Glasgow Herald* in 1782.

France.—The first French newspaper, the *Gazette de France*, appeared in 1631, edited by Theophraste Renaudot, a physician, who had been in the habit for some time previously of presenting to his patients a printed account of the various occurrences of the day. The *Gazette* had a most successful career and existed until 24 Aug. 1848, when it was suspended. Two weeks later it was resumed under the title of *Le Peuple Français*, which title was again altered to *L'Etoile de la France*. The *Gazette Burlesque*, a newspaper in verse, was commenced in 1650, under the management of the poet Jean Loret. The *Mercure Galant* was started by Donneau de Visé in 1672 and under the title of the *Mercure de France*, to which it was changed in 1717, continued to exist until 1853. After the Revolution a host of new papers appeared. Among these were the *Chronique de Paris*, the *Orateur du Peuple*, Herbert's *Père Duchesne* and *Ami du Peuple*. Of all the newspapers, however, commenced at this eventful period, the only ones which have survived are the *Journal des Débats* and the *Moniteur*. Under Napoleon the press was subjected to a rigid censorship, which was continued until 1819. During the reign of Louis Philippe appeared *La Presse* and *Le Siècle*, both of which commenced in 1836. Since that date the growth of the newspaper press in Paris has been rapid. In 1903 over 1,400 newspapers were regularly published in Paris alone, some 60 of these being daily political organs. The most important of all is the *Temps*, with politics of moderate republicanism. *Le Petit Journal*, a cheap popular journal, has a circulation of over 1,000,000 daily.

Germany.—Egenolf Emmel, sometimes called the father of journalism, established at Frankfort in 1615 *Die Frankfurter Oberpost-amszeitung*. A second journal was commenced at Hildesheim in 1619 and a third at Herford in 1630. At the end of the 17th century there were at least 30 daily newspapers in Germany. The *Hamburgischer Correspondent* appeared in 1714 as a continuation of the *Holsteinische Zeitungscorrespondance*, established in 1712. It was the first German newspaper which received news of foreign affairs from correspondents resident abroad. The *Allgemeine Zeitung* was published in 1798, and soon rose to the highest position in German journalism. Other important journals are the *Norddeutsche Allgemeine Zeitung*, the *National Zeitung*, the *Neue Preussische Zeitung*, the *Volks-Zeitung*, the *Vossische Zeitung*, the *Kölnische Zeitung*, etc.

Russia.—The first journal in Russia appeared in 1703, and was followed by several others during the first half of the 18th century. The press in Russia is under very strict supervision and thus naturally has but little influence in public affairs. The *Journal de Saint Petersburg*, in French, has a considerable circulation outside of Russia.

Holland and Belgium.—The pioneer newspaper of Holland was first published in 1656. The early Dutch newspapers were distinguished by the accuracy of the information furnished by them. It was not until 1830 that they began to comment on public occurrences, their crit-

icism having been previously directed to items of commercial intelligence. The principal Dutch journals are the *Allgemeene Handelsblad* of Amsterdam, the *Haarlemsche Courant*, the *Journal de la Haye* and *Staats-Courant*, the two latter published at The Hague. Among Belgian papers the *Indépendance Belge*, the *Journal de Bruxelles* and the *Etoile Belge* are distinguished for the ability with which they are conducted.

Australia.—There are nearly 1,000 papers published in Australia. The daily issues are excellent imitations of the London newspapers. The *Sydney Gazette* was established in 1803.

India.—The first Indian newspaper in the English language appeared in Bengal in 1780. There are upward of 300 newspapers published in the various vernacular tongues.

In Turkey the first newspaper appeared in 1795 in French and the first daily journal in Spain was published in 1704. The modern newspapers of Norway, Sweden, Denmark, Italy, South Africa, Switzerland, Portugal, Greece, China, Japan and South and Central America, are of less importance than those of the other countries heretofore mentioned, being largely local in character.

NEWSPAPER SYNDICATE, an association for the furnishing of special news features, generally of a literary nature, to daily and weekly newspapers. See PRESS ASSOCIATIONS.

NEWSPAPERS, American. The history of the printing of newspapers in America properly begins on 25 Sept. 1690, for it was upon that date that Richard Pierce, of Boston, issued the first number of what was to have been a periodical publication. Strange as it may seem, however, this first American journalist was endowed with a sense of originality of which even the makers of the modern sensational newspaper might find reason to be proud, for, in his salutatory, he stated that as there were many false rumors being circulated in the town of Boston which were constantly doing a great deal of harm, he requested his readers to furnish him with a list of those persons who were starting such stories that he might advertise them in the succeeding issues of his paper. In other words, his plan was to print a regular weekly list of all the liars in town, a scheme which would certainly have sold many copies of the sheet had not the authorities put an end to the project by promptly suppressing the newspaper. This journal was to have borne the name of "Public Occurrences, both Foreign and Domestic."

As only one issue of this strange newspaper appeared, the historians of journalism have usually failed to mention it, but, instead, have given the credit for the publication of the first periodical to John Campbell, a Scotchman, and

the postmaster at Boston, who issued the first number of *The Boston News-Letter*, on 24 April 1704. It was printed on half a sheet of pot paper, $7\frac{1}{2} \times 12\frac{1}{2}$ inches, with a small pica type, and its entire contents consisted of several extracts from *The London Flying Post*, in relation to the Pretender; the queen's speech to Parliament regarding that subject; a few items of local news; four short paragraphs of marine intelligence from New York, Philadelphia and New London, and a single advertisement—that of the proprietor. This was just 82 years after the appearance of the first English newspaper in London and 99 years after the first newspaper in France. Germany had antedated all other countries, having made several short-lived attempts to establish periodical journals as early as the latter part of the 16th century.

For more than 15 years Campbell had the journalistic field entirely to himself, but, in the latter part of 1719, another paper, called *The Gazette*, was started in Boston and, in 1721, a third was established by James Franklin under the name of *The New England Courant*. In the meantime there had appeared at Philadelphia the first newspaper published outside of New England. It was called *The American Weekly Mercury*, and its first number was issued by Andrew Bradford, the son of William Bradford, 22 Dec. 1719. The first paper to be printed in New York was *The New York Gazette*, established in October 1725, but by 1740 the number of newspapers in the English colonies in America had increased to 11, three of which had been established in Pennsylvania—one being printed in German—one in New York, one in Virginia, one in South Carolina and the remaining five in Boston.

In the beginning the American newspaper was a very small affair, being little more than an abstract of such papers as might chance to arrive from Europe on or about the date of publication. In fact, little change was made in them until after the time of the Revolution when the political agitators found it convenient to make use of them in presenting their appeals to the people. It was largely for this purpose that the first daily newspaper, *The American Daily Advertiser*, was established in Philadelphia by Benjamin Franklin Bache, in 1774. During the time that the seat of government was at Philadelphia, it was this paper that was used by Jefferson to oppose the Federal section of Washington's administration as well as all measures which originated with Hamilton or his friends. In 1802 Zachariah Poulson became its proprietor and the name which he gave to it, *Poulson's Advertiser*, was retained until 1839, when it was consolidated with *The North American*.

The second daily newspaper was *The New York Daily Advertiser*, first issued on 1 March 1785, by Francis Childs and Company. About a year later, 20 July 1786, the first newspaper appeared west of the Alleghany Mountains. It was published at Pittsburgh, Pa., and was called *The Gazette*. During the early post-Revolutionary days, Alexander Hamilton's special organ was *The United States Gazette*, a paper established in New York in 1789, by John Fenno, of Boston.

The territory comprised within the New England States had no permanent daily newspaper until 3 March 1813, when the Boston

Daily Advertiser was started by William W. Clapp. Prior to that time two distinct attempts to establish such papers had been made. As early as 6 Oct. 1796, Alexander Martin, an Irishman, started *The Polar Star*, which lived about six months. It was followed, 1 Jan. 1798, by Caleb P. Wayne's *Federal Gazette*, which ceased publication in less than three months. Of the hundreds of papers started in New York between 1725 and 1827, when the first number of *The Journal of Commerce* appeared, only two now survive, *The Commercial Advertiser*, now better known as *The Globe and Commercial Advertiser*, and *The Evening Post*.

The history of the penny newspaper dates from 1830, the idea having been suggested by the *Illustrated Penny Magazine*, first issued in London during that year. During the next few years, therefore, several similar attempts to introduce cheap papers were made in the United States, notably at Philadelphia and Boston. As these publications were always as small as they were cheap, however, they were but short-lived, and it was not until 1 Jan. 1833, when the price of *The Morning Post* was reduced to one cent by its publishers, Dr. Shepard, Horace Greeley and Francis V. Story, that any pretentious effort was made to print a cheap newspaper. Although this experiment was not a success its failure was due to causes other than that of the price, so, when Benjamin H. Day established the *New York Sun*, 3 September of the same year, he also fixed its price at one cent and the day of the cheap press had come.

DEVELOPMENT OF AMERICAN JOURNALISM FROM 1775 TO 1915.

(A) Ayer's American Newspaper Annual.

* Tri-weekly.

† Includes bi-monthlies and tri-weeklies.

Following are the 10 oldest newspapers of the United States which remain in existence in 1916:

Portsmouth, N. H., <i>New Hampshire Gazette</i> , established.....	1756
Newport, R. I., <i>Mercury</i>	1758
Windsor, Vt., <i>Journal</i>	1763
Hartford, Conn., <i>Courant</i>	1764
New Haven, Conn., <i>Journal-Courier</i>	1766
Philadelphia, Pa., <i>North American</i>	1771
Baltimore, Md., <i>American</i>	1773
Alexandria, Va., <i>Alexandria Gazette</i>	1784
Augusta, Ga., <i>Chronicle</i>	1785
Hudson, N. Y., <i>Gazette</i>	1785

The colonial newspapers devoted most of their small space to foreign affairs, copying from and reflecting the style of the London papers. Local matters were considered too well known to be worthy of mention. The arriving and sailing of vessels and sometimes the comings and goings of stagecoaches, with a few advertisements, mostly about slaves and apprentices, are about the only sort of local chronicles that can be found in the papers prior to 1750. Sometimes letters or parts of letters from people in adjoining towns were printed, but the rule seems to have been to regard as most important the things that were farthest away.

Between 1750 and 1760 there developed a style of vituperative journalism that prevailed largely until about 1833. The idea of freedom of the press had taken strong root in the American mind, and the early disposition was to use the newspapers to ventilate all sorts of animosities, but mainly political squabbles growing out of the competitions of office seekers. The press in the early days of the Republic was mainly partisan and secured most of its support from politicians. Advertising had not yet developed, and subscribers were few. Paper and printing were expensive, so that there was little to be made by running a newspaper. In fact, most of the journalists of the early days seem not to have depended upon their papers for a living, but to have run them as side issues. Under such conditions it is not surprising that space came to be given up largely to minor political squabbles and windy communications from writers hiding under such *nom-de-plumes* as "Vox Populi," "Veritas," etc.

There were no systematic attempts at news-gathering. Editors took their choice of what interested subscribers sent in, with never a thought of reporting important gatherings or conventions. It was not until 1833 that the first real American newspaper appeared in the *New York Sun* and the success of its policy of publishing the news instead of devoting its columns to the editor's personal and often eccentric opinions upon political matters was so immediate that it was soon followed by many rivals. Most notable of these was *The Herald*, first issued by James Gordon Bennett in 1835, which promptly took the lead. There had previously (1801) been established in New York *The Evening Post* (which William Cullen Bryant began to edit in 1828), and *The Journal of Commerce*, which dates from 1827.

Bennett was a natural reporter and gathered two or three times as much news as the *Sun*, and really laid the foundations of the modern school of American journalism. He was the first to print financial news, to discuss theatres and plays, to write up the happenings in clubs and social life and to give the talk of the street. He was also the first to attempt a prompt report of a big fire, with a picture of the burning building in 1836. Dana and Bryant showed themselves great editors, but Bennett outclassed all his contemporaries in business management, gathering the most news, both local and foreign, and getting it quickly on the street. He was also the first to develop a considerable line of advertising. He was the first to demand larger and faster printing presses and to issue the "triple sheet" of 12 pages, the progenitor of the modern multiple page newspaper.

In 1841 *The Tribune* entered the New York field, with Horace Greeley as editor, and if Bennett taught the others how to do business, to Greeley, Dana and Bryant must be awarded the credit of establishing the strong editorial utterances which have ever since been characteristic of the American press. Abandoning the vituperation of earlier journalists, these men, all gifted scholars, taught the growing newspaper editors of America how to write and how to edit newspapers so as to command the respect of their fellow-men, even when they disagreed with the editorial policy or conclusions.

The New York *Times* came in 1851, with Henry J. Raymond, an admirable reporter and able writer, worthy of his colleagues.

Other great newspapers and editors of the antebellum days were: The Springfield (Mass.) *Republican*, started as a weekly in 1824 and made a daily in 1844 and attaining national celebrity through the genius of Samuel Bowles. In 1830 The Boston *Transcript* appeared and the Detroit *Free Press* in 1831. The Philadelphia *Inquirer* dates from 1829. The Philadelphia *Public Ledger* was first issued in 1836 and under the management of George W. Childs easily led the press of Pennsylvania. The Baltimore *Sun*, New Orleans *Picayune* and Milwaukee *Sentinel* were all born in 1837. The Brooklyn *Eagle* first saw the light in 1841. The Cincinnati *Enquirer* in 1842 and the Cleveland *Plain Dealer* in 1843. The career of the Boston *Herald* began in 1846. The Chicago *Tribune* and Milwaukee *Wisconsin* were founded in 1847 and in 1848 the Cleveland *Leader* appeared and was brought into prominence by Edwin Cowles. The Saint Louis *Post-Dispatch*, over which Murat Halstead presided, was born in 1851, the same year as the New York *Times*. The first great paper founded on the Pacific Coast was the San Francisco *Call*, dating from 1856. The New York *World* did not appear until 1860 and it was along in the eighties before it received the inspiring guidance of Joseph Pulitzer, great editor and keen business man.

Prior to 1810 the circulation of the most widely read daily newspaper did not exceed 900 copies, while there were few publications, either weeklies or semi-weeklies, that could boast of a larger circulation than that of 600 copies. There were about 25 dailies in 1810, issuing 310 times a year; 36 semi-weeklies; seven tri-weeklies and 290 weeklies, the aggregate circulation for the

when the total products of the newspaper and periodical industry of the country was stated to be \$232,993,094, and when there were 108,672 persons employed in this business. During this year the amount received from advertising was \$148,534,392, while the amount from subscriptions and sales was \$84,438,703. The above table is interesting as showing the steady development in number and circulation of the industry of daily paper making in America.

Newsgathering.—To attempt to tell the story of the growth of the American newspaper without relating some particulars in regard to the wonderful feats which it has from time to time performed would be to give but a superficial view of the subject. Prior to the days of the telegraph the daily press had great difficulty in obtaining its information about current events in other parts of the country. To offset this disadvantage they adopted three methods of quick communication. One was by pony express; another was by carrier pigeons, and, when steam had been sufficiently developed to make fast traveling by rail or steamboat possible, special trains and boats were frequently chartered for special occasions. The New York *Herald* and the New York *Journal of Commerce* were the first papers to own swift sailing yachts which were used to obtain early information from incoming European vessels, while A. S. Abell, of the Baltimore *Sun*, established his own overland express between New Orleans and Baltimore. This consisted of 60 blooded horses, housed at conveniently located relay stations, and the project was so successful that, during the Mexican War, he not only beat all the other newspapers in getting news, but he secured his information so far ahead of the government's own dispatches that he was able to advise the officials at Washington of important events sometimes more than 30 hours before the reports of the happenings had been received at the War Office. Another instance of conspicuous enterprise was shown by Henry J. Raymond. While a reporter for the New York *Tribune*, he was sent to Boston to report a notable speech by Daniel Webster. Returning by boat, he arranged to have the necessary composition frames and cases erected in his room, that, as fast as he could write, the sheets might be put into type, so that all were ready for publication the instant he reached the office.

In 1846, when the entire country was so greatly excited over the Oregon boundary dispute with Great Britain, several of the newspapers combined to send a swift pilot boat to England. There all the important news was obtained; the boat returned as quickly as it went, and the American people were provided with the information they craved many days before it could possibly have arrived if it had come by the ordinary channels, the slow-sailing vessels of that day.

As so much enterprise was shown by newspaper publishers at a time when the means of quick communication were few and costly, it was but natural that they should have hailed the steam railroad and the electric telegraph with delight. During the 10 years between 1840 and 1850, the period in which these inventions were first generally extended, the circulation of the American papers increased more than two-fold.

YEAR	Number of daily papers published	Total circulation per issue
1850.....	254	758,454
1860.....	387	1,478,435
1870.....	574	2,601,547
1880.....	971	3,566,395
1890.....	1,610	8,387,188
1900.....	2,235	15,102,156
1910.....	2,470	*23,000,000
1915.....	2,494	*29,000,000

* Estimated.

year being estimated at considerably less than 2,000,000 copies, while the value of the paper used could not have been in excess of \$45,000. Compare those figures, therefore, with these from the last available United States census,

Samuel Toplift of Boston was the first systematic gatherer of foreign news in the United States. For 30 years, beginning about 1820, he met the European boats in Boston harbor, and brought the news to the Exchange Coffee House, whence it was forwarded to New York by pony express. In 1848 seven of the large New York daily paper owners combined forces for gathering news outside of the New York field, and the Associated Press was thus formed. In the course of time smaller news-gathering associations were formed by groups of newspapers in various localities. The New York Associated Press gathered the foreign and Washington news, and exchanged its budget of news with these smaller associations, thus covering the entire field. They dominated the news field for many years, and sometimes refused to serve newspapers, and did not serve other newspapers to their satisfaction. Competition arose in the United Press and the Western Press Association. A few of the more wealthy owners of the Associated Press then purchased a controlling interest in the United Press, and thus stopped competition, except that of the Western Association. These two associations ran in opposition for a few years, and then Melville E. Stone, manager of the Western Association, convinced all parties that conditions were wrong, and that there should be no private ownership of newsgathering. Thereupon the present Associated Press was born, as a New York corporation, in 1900, with conditions that enable any newspaper to come in, and exercise a vote in the control. It had, in 1916, a membership of about 900 newspapers, and expended in the vicinity of \$4,000,000 a year for news.

Owing to the high rates at first charged for telegraph and cable messages the papers of those days did not get the almost unlimited news service which they receive to-day. Even as late as 1879 the night rate from California to Boston was 10 cents a word; between Chicago and Boston it was five cents a word, and between Washington and Boston, two cents a word. Since that time the rates have been reduced fully 75 per cent. The original cable rate was \$100 for 20 words, whether served to newspapers or to the general public, while the rate to newspapers is now but 10 cents a word, either for day or night service.

The result of the high tolls was shown in the compact dispatches published by the newspapers of that day. For example, when the *America* won the international yacht race, 22 Aug. 1851, no report of the event was received by any American paper until 4 September, when the news came in the form of a dispatch from Halifax. On this day the report in the New York *Sun* contained about 500 words, the *Tribune* used but 250 words about the contest and the *Evening Post* was content with 200 words. So, too, when Brooks assaulted Sumner, the senator from Massachusetts, in 1854, the longest report sent to any Boston paper comprised less than half a column, and this was printed quite inconspicuously at the bottom of the page. In 1860, when Lincoln was nominated for the Presidency, at Chicago, one operator was able to send out all the press matter that was offered to him, while, at recent conventions, the hundred and more operators

have had all they could do to handle the millions of words of descriptive matter filed with them by correspondents representing every newspaper of prominence in the country. When these facts are remembered, however, it does not seem so strange that the aggregate number of words of press matter that went over the Western Union wires in 1879 was but 28,000,000, whereas the total number of words contained in press specials handled by the same company in recent years has been no less than 10 times as great.

Scarcely more than 40 years ago some of the most progressive journals in this country depended solely upon boys to carry their papers to their subscribers, while larger lots, the papers intended for dealers, were trundled through the streets on wheelbarrows. To-day all the newspapers have their own systems of fast delivery wagons, and the most progressive publishers charter "special" trains, not only for their Sunday editions, but frequently for other occasions during the year.

The growth of the Sunday newspaper, dates from the Civil War, but it was many years after the conclusion of that struggle before the large Sunday editions began to make their appearance. In fact, it was only in 1870 that one of the leading papers in Boston increased the size of its Sunday issue from four to eight pages, and, strangely enough, the change met with all kinds of adverse criticism. During the next few days many of the subscribers to this journal called at the office to protest that the new paper was much too large, and this same criticism has continued as the great Sunday papers have steadily increased in size.

In 1916 there were 10,929 cities and towns in the United States having newspapers. New York City led with 981, and New York State with 2,121; Illinois had 1,826, Pennsylvania 1,358, Ohio 1,128 and Texas 1,081; New York State had 208 dailies and 1,100 weeklies, Illinois 181 dailies and 995 weeklies, Pennsylvania 212 dailies and 840 weeklies, Ohio 172 dailies and 715 weeklies, Texas 98 dailies and 864 weeklies. No other State had as many as 1,000 newspapers. The Southern States had 4,131, the Mid-Western States 5,013, the Western 6,349, and the Pacific Slope States 2,079.

Classification of Papers.—While the newspaper directories and census reports class all sorts of publications together, and they are included in all the totals here given, it should be understood that many of the publications referred to are no longer generally known as newspapers, the title magazine being chosen by many monthlies and periodicals, by many weeklies, bi-monthlies, monthlies, etc. The first United States newspapers were mostly weeklies, and scarcely entitled to be called newspapers, because they did not begin to systematically gather news until after 1830. When the public came to appreciate what real news was, the daily newspapers experienced a rapid growth, and in 1916 there were 2,494 of them, more than in any other country on the globe. Their issues of six times a week represent a much greater volume of circulation advertising and general business than the 16,000 weeklies, the majority of which are what are termed country newspapers, retailing the minor happenings of the small towns, with their social gossip, interesting mainly to

those who have personal acquaintance in the locality.

The religious weekly had its rise before the Civil War, the *Independent* being emblematic of this class. These were the first publications to obtain national circulations in the United States. The first important trade paper was the *Dry Goods Economist*, established 1846; a year previous the *Scientific American* had made its debut. *Harper's Magazine* appeared in 1850 and *Harper's Weekly* in 1856. The *Iron Age*, the second great trade paper, was first issued by David Williams in 1855. The *Engineering and Mining Journal*, the first of the engineering press, had its modest beginning in 1866. The success of these papers in special fields opened the eyes of publishers to the opportunities of what is now known as trade journalism and class journalism, and many thousands of periodicals are now issued covering all important fields of human activity. The more important classes are indicated below:

Classified publications	No. in U. S.	Classified publications	No. in U. S.
Magazines, women's publications and mail order journals.	210	Insurance.	81
Religious.	1,031	Journalism.	19

The Publishers' Association.—With a realization that it was essential for the newspaper publishers to organize to remedy abuses in advertising, and confer on matters of mutual interest, the American Newspaper Publishers' Association was organized in 1887, and has for many years maintained a headquarters in New York City. Advertising has been systematized and connections largely insured through the co-operation of this organization. During recent years the annual gatherings have developed more and more into conferences as to wise business policies. They make five-year agreements

with the labor unions, deal as an organization with the express companies and paper manufacturers and maintain a bulletin for distributing regularly information of value to the members, who numbered in 1916 over 350 of the larger newspapers of the United States and Canada.

Mechanical Equipments.—The tremendous development of newspapers would have been impossible without the construction of rapid machines for printing, stereotyping, folding, typesetting, etc. Up to about 1840 the single cylinder printing press, with a capacity of 1,000 to 1,500 sheets on one side per hour, was the only means of newspaper production. R. Hoe and Company brought out a double cylinder machine, which doubled the capacity. Still more speed being required, the type-revolver was invented and manufactured in many forms by Hoe. (See PRINTING PRESSES). Then followed the perfecting press, printing from a roll of paper on both sides. About 1875 Andrew Campbell built a web stereotype perfecting press, with rotary folder, capable of high speed, but failed to push his invention. Shortly afterward the Hoes brought out their lightning perfecter, which was brought to its modern form by Stephen D. Tucker and Luther C. Crowell about 1884, and with this machine a majority of the great newspapers of the world are equipped. The capacity of a single machine is about 24,000 papers per hour, but by duplication and quadrupling the mechanism this output can be increased almost indefinitely, some presses having been built with a capacity of 216,000 eight-page papers per hour.

In recent years Goss, Scott, the Duplex and Wood companies have come into the field of fast newspaper presses, so that there is great variety of choice for the newspaper publisher. The smaller dailies are commonly equipped with the duplex presses, which print direct from the type, without stereotyping, at speeds of 3,000 to 10,000 papers per hour. Mechanical typesetting was first commercially successful in the United States, in the Thorne machine, but about 1885 the linotype machines of Ottmar Mergenthaler began to take the market. (See COMPOSING MACHINES). Another single type machine, the monotype, enjoys a large sale. In 1914 the intertype and linograph machines appeared, based largely on expired patents of the linotype.

In the field of stereotyping, the autoplote machine of H. A. W. Wood came into use about 1890, being the only automatic stereotyping machine, and generally employed by the great newspapers of the world. Since an increasing number of newspapers have circulations from 200,000 to 600,000 daily, requiring a press capacity that will deliver all these papers within two hours' time, and since these papers are commonly 16 to 24 pages in size, and occasionally 64 to 128 pages, it will be apparent that the pressrooms of the large daily papers have developed into vast manufacturing establishments of wonderful capacity and reliability.

CHARLES H. COCHRANE,
Of the Staff of *Newspaperdom*.

NEWSTEAD (nū'stéd) **ABBEY**, England, on the border of Sherwood Forest, 10 miles northwest of Nottingham, was an Augustinian Canons institution founded in 1170 by Henry II in atonement for Becket's murder. In 1540,

after the dissolution, it was given to Sir John Byron the Little, and is celebrated in connection with Lord Byron, the poet, who made the semi-ruinous edifice his home in 1808, but sold it in 1818. The abbey has since been restored, and has many carefully preserved relics of the poet. Consult Irving, 'Abbotsford and Newstead.'

NEWT, nūt, a small tailed batrachian of the genus *Diemyctylus*, *Triton*, or a related genus, usually classed under the *Salamandrinae*, but sometimes considered to constitute a distinct family, under the name *Pleurodelidae*. Newts are sometimes also called elfs or tritons, and the name is often loosely applied to salamanders of other genera not closely related. Among technical characteristics of the newts in general are the bony carpus and tarsus, the bony ball-and-socket joints of the vertebræ, the bony post-frontal-equamosal arch of the skull and the narrow bands of palatine teeth. The tongue is generally very small. The species are more strictly aquatic than most salamanders, and the males of most species undergo remarkable seasonal changes in the development of high dorsal crests, papillæ or other appendages on the arms and elsewhere; and of brilliant colors. About 20 species belonging to this group of genera are known, of which more than half are European, several Asiatic and only two North American, while none have been found elsewhere. The eastern American species (*Diemyctylus viridescens*), of which a quite distinct variety occurs in Texas and Mexico, is abundant throughout the Eastern States, and extends into Canada. It may be distinguished by the rather narrow arched head marked with a pair of longitudinal keels, and the handsome greenish red color of the back, the pale yellow below and the row of conspicuous scarlet, black-bordered spots on each side. In the adult stage just described this animal is about three and one-half inches long and completely aquatic. A terrestrial form is somewhat smaller, lacks the dorsal crest altogether, has a rougher skin and a bright vermilion color. This is the pretty little creature common in Eastern woods, which later returns to the water and assumes the greenish garb. Newts are chiefly nocturnal, and when abroad swim actively, not merely crawling on the bottom in the manner of most salamanders. They feed on all kinds of aquatic larvæ, worms, small mollusks and crustaceans, and are very voracious. During the breeding season in the spring the male develops a broad cutaneous fin, richly provided with sense organs on the back and tail, and becomes otherwise modified. The fertilized eggs are deposited singly, each in a gelatinous capsule whose adhesive nature permits of their attachment to water-plants, some of the leaves of which are drawn about each egg. The larvæ are strictly aquatic and possess three pairs of external gills, but after metamorphosing, leave the water and assume the red terrestrial phase, when they live in the woods under stones and logs, appearing at night or during rain. This stage lasts for several years, when they seek the water either in the spring or fall and soon acquire the adult color and characteristics. Whether or not they can again enter the red phase by leaving the water is not certainly determined. Like frogs, newts swallow the skin after molting, which appears to take place most readily while the animal is immersed in water.

The Pacific newt (*Diemyctylus torosus*) is nearly twice as large, and is further distinguished by the wide, flat keelless head, and brown, unspotted color. It is very abundant in California, and ranges from the southern part of that State to Alaska. Its habits are essentially similar to those of the Eastern species. It feeds on earthworms, snails, slugs, insects, and its own sloughed skin, eggs and young. In this species the eggs are deposited in clumps.

The numerous European species present many interesting differences in detail in habits, especially in the mode of reproduction. Some of them live habitually away from the water and migrate long distances to it in the spring, and one species is remarkable from the fact that the ribs penetrate the skin. All of the newts make very interesting and satisfactory aquarium pets.

J. PERCY MOORE,
University of Pennsylvania.

NEWTON, nū'ton, Alfred, English ornithologist and zoologist: b. Geneva, 11 June 1829; d. London, 7 June 1907. He was educated at Magdalene College, Cambridge, of which he was travelling Fellow 1854-63, Fellow in 1877 and till his death professor of zoology and comparative anatomy. He took a prominent part in urging bird protection by legislation; traveled in Lapland, Iceland, West Indies, North America, the Pacific and Spitzbergen; edited *The Ibis* (1865-70) and the *Zoological Record* (1870-72); contributed the ornithological articles in the 9th edition of the 'Encyclopædia Britannica'; and greatly advanced the study of the comparative anatomy of birds. He wrote 'The Zoology of Ancient Europe' (1862); 'Ootheca Woolleyana' (1864-1902); 'Zoology' (1894); and a 'Dictionary of Birds' (1893-96).

NEWTON, SIR Charles Thomas, English archaeologist: b. Bredwardine, Wales, 16 Sept. 1816; d. Margate, 28 Nov. 1894. He was educated at Shrewsbury School and at Christ Church College, Oxford, and was assistant in the department of antiquities in the British Museum, 1840-52. He became vice-consul at Mytilene in 1852 and acting consul at Rhodes in 1854; discovered the tomb of Mausolus at Halicarnassus and the famous bronze serpent of Delphi at Constantinople and after a year as consul at Rome in 1861 became keeper of Greek and Roman antiquities in the British Museum, being the first incumbent of this post and holding it until December 1885. During this term he furthered archaeological excavations in Ephesus, Priene, Smyrna, Sicily, Cyprus, Cyrene and Rhodes and procured for the British Museum the Farnese collection, the two Castellani collections and those of Pourtales and Blacas. From 1880 to 1888, Newton (who was knighted in 1887) was professor of classical archaeology in University College, London; to his work there and in the British Museum is largely due the revival of English interest in classical antiquities. He wrote 'Method of the Study of Ancient Art' (1850); 'History of Discoveries at Halicarnassus, Cnidus and Branchidae' (1862-63); 'Travels and Discoveries in the Levant' (1865); and 'Essays on Art and Archaeology' (1880).

NEWTON, Gilbert Stuart, English painter: b. Halifax, Nova Scotia, 20 Sept. 1794; d. Chelsea, England, 5 Aug. 1835. His mother was sis-

a delightful and accurate study of life among the Maori tribes before annexation.

J. B. McDONNELL,

Editorial Staff of The Americana.

NEW ZEALAND FLAX. See FIBRE.

NEWARK, nū'ark, Del., town in Newcastle County, on the Philadelphia, Baltimore and Washington, and the Baltimore and Ohio railroads, about 11 miles south of Wilmington. It is in a section of the State noted for its productivity. The chief manufactures are paper, machinery, fibre, acids and canned goods. There is considerable trade in the manufactured articles, fruit and vegetables. It is the seat of the State College, opened in 1833. The town owns and operates the electric-light plant and the waterworks. Pop. 2,800.

NEWARK, N. J., city, county-seat of Essex County, metropolis of the State, in lat. 40° 41' N., long. 74° 10' W.; on the Passaic River and Newark Bay, eight miles by rail from New York City and within the direct zone of the business influence and activities of the nation's metropolis. In 1920 it ranked 11th in manufacturing and 15th in population among the cities of the United States. It has an area of 23.40 square miles, of which 6.48 square miles were until recently meadow land lying in the southern and southeastern section. The wharf frontage on the river and bay is 10½ miles; the width of the channel is 300 feet; depth at mean low water, 20 feet and at high water, 25 feet.

Port Newark Terminal.—In 1908 the city undertook the reclamation of its meadow land, but it was not until 1914, after the creation of the municipal department of docks and meadows, that substantial results began to appear. The area of the meadow development zone was 1,150 acres, and in a little over a year an area had been reclaimed aggregating 294 acres, of which 124 acres were reserved for new streets, freight yards, stations and dock frontage, and 170 acres were set apart for leasing for manufacturing and commercial purposes. The authorized bond issues for the development, up to 1 Oct. 1915, totaled \$2,250,006, and the disbursements and balances due on contracts, \$2,013,608. After the United States had been forced into the World War, this section was deemed of such vital importance to the National government that the latter bought and leased large portions of the reclaimed area, and in 1917 established there a great submarine-boat construction plant and an extensive reservation for the needs of the quartermaster's department of the army. These and other national acquisitions early in 1918 transformed a large part of the former useless salt meadow land into a bustling suburb and gave the city an additional industrial population of over 100,000.

Manufactures.—The city has the distinction of ranking first in the Union in the value of its manufactures and the diversity of its industries, according to its per capita population. It has 252 distinct lines of industry, 50 lines turning out values from one to \$30,000,000 annually. It is the largest fine jewelry manufacturing centre in the United States; produces the largest variety of leather for shoes, carriages and upholsterings; is the home of the mother-of-pearl button and novelty industry; produced the first malleable iron in America; built the first locomotive engine to travel up grade; made the first patent leather in the country and gave celluloid and its products to the world. In 1915 the city had 2,294 manufacturing establishments using power and employing over 10 persons, with an invested capital of \$225,640,600, employing 82,439 operatives; using material valued at \$130,299,000 and having an output valued at \$250,654,527. The leading industries, according to the value of the finished products exceeding \$5,000,000 were smelting and refining of metals, \$35,000,000; leather, tanned, curried and finished, \$20,118,000; foundry and machine shop products, \$15,403,000; malt liquors, \$12,072,000; jewelry, \$11,215,000; electrical machinery and apparatus, \$8,920,000; paints, oils and varnishes, \$7,761,000, and chemicals, \$6,077,000.

Transportation and Commerce.—The following trunk line railroads connect the city with all parts of the country: Pennsylvania, Lackawanna, Lehigh Valley, Erie and Reading (Central of New Jersey). Electric railways comprise the Hudson and Manhattan Tubes systems, and trolley lines extend to all important points in the State. Daily trunk line passenger trains to and from the city average 882; freight trains, 101; annual railway tonnage received, 2,366,350; shipped, 1,157,876; cars of merchandise freight received and shipped annually, 335,467; passenger stations, 14; freight delivery yards, 23; daily electric railway trains to and from New York, 233; time between the two cities, 18 minutes. The large number of local trains which connect with the New York ferries and the cities on the Hudson give Newark the advantage of the ocean steamer traffic. The Passaic River entering the Newark Bay furnishes the city a most important direct water route to the ocean.

Buildings and Municipal Improvements.—The number of public buildings in the city is 141; value of municipal property, \$73,468,507; principal public buildings: United States Government Building, Essex County Courthouse (cost \$1,750,000), City Hall (\$1,500,000), Free Public Library (\$350,000) and the public schools. The city is widely noted for the excellence of its water supply, having its source in the Pequannock River and delivered on the gravity system. The daily capacity of the watershed is 50,000,000 gallons and the average daily consumption, 46,500,000 gallons. There are eight storage and distributing reservoirs, with a storage capacity of 9,825,700,000 gallons. Newark has 260 miles of paved and 62 miles of unpaved streets; 309.19 miles of sewers; 5,575 gas and electric street lights; 20 city parks with gross area of about 20 acres; 5 county parks within the city of about 642 acres; city parkways of eight and one-half acres and a seashore camp of 11½ acres at Avon-by-the-Sea for deserving children during summer seasons. The police department, with 794 men, cost annually \$1,083,200 and the fire department, with 472 men, costs annually \$720,080. Recent municipal improvements also include Port Newark Terminal, previously noted.

Churches and Charitable Institutions.—Newark has a total of 181 churches divided denominationally as follows: Presbyterian, 34; Roman Catholic, 32; Baptist, 25; Methodist Episcopal, 18; Protestant Episcopal, 17; Jewish, 11; Lutheran, 10; Reformed Dutch, 8; Congregational, 3; Science, 2; Universalist, 1; miscellaneous bodies, 23. Its benevolent activities are promoted by 62 charitable organizations and in institutional work there are 12 hospitals, 5 orphan asylums and a large number of specialized centres.

Social Welfare.—There are over 700 regularly organized societies engaged in all manner of social service, besides a very large number of patriotic units rendering most efficient service for the Newark soldiers and sailors in the World War. Strictly social clubs exceed 100 in number; building and loan associations, 256; improvement associations, 13, and savings and loan associations, 9.

Educational Interests.—Public school property has an estimated value of over \$10-

720,000. There are 67 public schools of the different grades, with over 2,000 teachers and 73,000 pupils; cost of maintenance (1916), \$3,219,288; 52 private and parish schools with an estimated enrolment of 25,000; 4 public high schools, 8 business colleges, 2 academies and 7 technical, drawing, law, industrial and normal schools. The Free Public Library cost for building, equipment, etc., \$1,064,000, has over 245,000 volumes; circulates annually some 1,125,000 volumes and is maintained at an annual gross cost of approximately \$150,500. An attractive Art Museum is maintained in the Library building and in the library proper popular exhibitions are frequently given. Other libraries are the Prudential Insurance Company's Law and Medical Library and the library of the Lawyers' Club. The New Jersey Historical Society has a collection of books, manuscripts, paintings and other articles of great historical value. In 1918 the United States Shipping Board organized a school of marine engineering here, and in 1919 the principal technical school was raised to the dignity of the Co-Industrial College of Technology.

Banking and Insurance.—Under the National Banking Act of 1913, Newark is included in Federal Reserve District No. 2, of which New York City is the central reserve city. In 1917 there were 9 national banks, 11 trust companies, 5 savings institutions and 13 savings departments in national banks and trust companies. National banks had combined resources of \$76,954,256 and deposits of \$57,683,620; trust companies, resources of \$50,915,242 and deposits of \$39,463,402; savings banks, resources of \$50,568,925 and deposits of \$47,244,972. Building and loan associations had assets of \$63,978,185, receipts of \$36,980,243 and shareholders, 94,254. Two of the largest life insurance companies in the United States, the Prudential and the Mutual Benefit, have their home in Newark. Together they reported assets of \$636,582,170, income \$159,714,502, disbursements \$104,252,855. There were five fire insurance companies with \$3,950,000 combined capital, \$23,769,711 assets, \$12,300,924 income, \$10,789,234 disbursements and \$5,025,491 fire losses paid in 1916.

Vital Statistics.—In 1917 there were reported 43,769 dwellings and 18,298 factories and commercial buildings in the city. The very large type of apartment houses dotted the city thickly in all of its strictly residential sections and was even encroaching on bustling business thoroughfares. In 1918 the city faced a serious housing problem because of the great influx of workmen at Port Newark Terminal and also at many of the large industrial plants on account of the unprecedented demands of the World War. The number of births (1916) was 11,446; rate per 1,000, 29.7; death rate per 1,000, 16.5.

Finances.—The assessed valuation of all taxable real estate and personal property in 1916 was \$420,311,342; value of all municipal property, \$73,468,507; total bonded debt, \$42,961,200; aggregate of sinking funds applicable to bonded debt, \$11,650,082; total net debt, city and water, \$31,311,118; tax rate per \$1,000 of valuation, 24.50.

History.—Immediately following the English conquest of the New Netherlands, in 1664, a part of the Dutch possessions in North Amer-

ica, being practically what is now the State of New Jersey, was granted to Lord John Berkeley and Sir George Carteret. The settlement of northeastern New Jersey was immediately begun under a liberal form of government, a site near the mouth of the Passaic River proving attractive to certain Congregationalists, then settled in the colony of Connecticut. In May 1666, the New Englanders removed "their families, their beloved pastor, their church records and communion service, their deacons and their household goods" to the site of the future city of Newark. By 1685, Newark, in which the Congregationalists had settled, was a compact town of 500 inhabitants. The system of local government was like that of many early New England villages, being the limitation of political and religious activity, through the agency of the town meeting to those who professed Congregationalism.

The strong element of conservatism, characteristic of the settlement of Newark, remained unchanged until long after the opening of the 19th century. Religion and education were warmly supported, and for several years the College of New Jersey, now Princeton University, was located at Newark. The tidal waters of the Passaic River gave easy access to New York, the country-side supplying provisions and wood to the inhabitants of Manhattan Island. Newark was also engaged in a coastwise trade. To a degree the young community was somewhat isolated owing to the difficulty of road-building over the marshes and the ridge of rocks separating Newark from Paulus Hook, now Jersey City.

In the Revolutionary struggle Newark took an active part. As early as June 1774, her inhabitants protested against the Port Bill, and offered to become parties to a plan of union to redress grievances. In November of the same year inhabitants of Newark, as members of the Essex County grand jury, patriotically answered the charge of the loyalist chief justice, while in January 1775, the royal newspapers were boycotted by many of the inhabitants of the town. In the spring of that year some of the inhabitants declared that they were willing to risk their lives and fortunes for American liberty. The "gentlemen traders of this town" were recommended not to supply provisions to Canada and other loyal portions of North America. In March 1776, the Newark committee regulated the price of West India products, and traders were notified that defiance of regulation would cause the storekeeper to be declared an enemy to his country.

Newark was early identified with the efforts made to secure internal improvements, even before the second war with England. Turnpikes were extended in every direction, bringing the town in close communication with the northwestern portion of the State, from which section Newark has largely drawn men who have become locally prominent. During the early years of the 19th century the first bank organized in New Jersey (1804) was established in Newark, while one of the chain of banks having the word "state" in their titles (1812) was located in this city. In 1824 the city was declared by legislative enactment to be the terminal of the Morris and Essex Canal, which was soon constructed, and united the waters of New

York Bay with those of the upper Delaware. During the early 30's the New Jersey Railroad was built between Jersey City and New Brunswick, which with Camden and Amboy connections placed Newark on the direct route between New York and Philadelphia. Following the construction of these lines, now a part of the Pennsylvania Railroad system, came railroads now forming parts of the Lackawanna and the Central Railroad of New Jersey systems, and more recently the extension of the Hudson and Manhattan tube service to the city. For five months in 1916 (May 1-Oct. 1) the city was in gala attire, celebrating the 250th anniversary of its founding. In 1917 the city adopted the commission form of government under five commissioners between whom in a like number of groups all former municipal departments were divided. In 1919 the United States Post Office Department selected a tract in the Forest Hill section of the city for a landing field for its aerial mail service. Pop. (1810) 8,008; (1830) 10,953; (1850) 38,894; (1860) 71,941; (1870) 105,050; (1880) 136,508; (1890) 181,830; (1900) 246,070; (1910) 347,460; (1920, Federal census) 414,524. Consult City records; Atkins, 'The History of Newark, N. J.'; 'Records of the Town of Newark, 1666-1836'; Dodd, H. P., 'Newark of Former Days and Newark of To-day' (1907); Urquhart, Frank J., 'A Short History of Newark' (1910, 1916); Newark Public Library, 'The Newarker' (5 vols., 1911-16); Dana, John Cotton, 'The Study of a City in the Schools of that City' (1911).

GEORGE J. HAGAR,
New Jersey Historical Society.

NEWARK, N. Y., village in Wayne County, on the Barge Canal, and on the West Shore, the New York Central and Pennsylvania railroads, about 176 miles west by north of Albany, and 30 miles east by south of Rochester. It was settled in 1820 by people from Rensselaer County in the eastern part of the State. It was incorporated as a village in 1825. It is in a fertile agricultural region, but the village has considerable manufacturing interests, including tinware works, paper box factories, a glass factory, canning and preserving factory and other establishments. Newark has a large trade in farm and dairy products, fruit and its manufactured articles. Its educational institutions are the Union Free School and Academy, the public elementary schools and the free public library. There are several churches and a number of church and literary charitable and educational societies. The State Custodial Asylum for Feeble-Minded Women is located here. The population consists of nearly all native-born Americans, over one-half of whom are of Dutch, German and Irish descent. The water-works are village property. Pop. 6,964.

NEWARK, Ohio, city, county-seat of Licking County, at the junction of three branches of the Licking River and on the Ohio Canal and the Baltimore and Ohio and the Pennsylvania railroads, about 30 miles east by north of Columbus, and within 14 miles of the centre of the State. It was settled in 1802 by a colony from the eastern part of the United States. Nearby are two large mounds which belong to the works of the "Mound Builders." It is in an agricultural region and in the vicinity are valuable deposits of sandstone, extensive,

coal-fields and natural gas. The chief manufactures are glassware, chemical instruments, carriages, hardwood, bottles, electric cars, locomotives, machine shop products, rope, foundry products, flour and lumber products. There are about 160 manufacturing establishments in which there are 12,000 employees. The streets are well paved and well kept. The State encampment ground and the Auditorium, a fine theatre erected as a memorial to dead soldiers of the Civil War, are of much interest. There are 28 churches, a high school, public and parish elementary schools and a public library, established in 1877. The five banks have a combined capital of \$850,000, and the annual amount of business transacted is \$3,600,000. The government is administered under the charters in accordance with the Ohio State Municipal Code. The inhabitants are nearly all American born. Baltimore and Ohio Railroad Company has locomotive and rolling stock repair shops in Newark with more than 2,000 employees. The Wehrle Company operates the largest stove manufactory in the world with 2,500 employees. Newark is the seat of Dennison University with 700 students (coeducational). On its outskirts is Buckeye Lake, the largest inland pleasure resort in Ohio. This lake is nine miles long and from one to two miles in width. Pop. (1920) 26,718.

NEWARK SERIES, in geology, a term applied to that part of the Triassic system (q.v.) in eastern North America. Its limits are Nova Scotia on the north and South Carolina at the south. The typical deposits are near Newark, N. Y., whence the name is taken. The deposits in the series are conglomerates; breccias; thick red sandstones, which must have originated in crystalline waste, as is evident from the comparatively large amount of mica and the feldspaths; and basalt, which accompanies the sedimentary rocks and occurs in dikes and sheets, such that the violent volcanic character of their derivation is made certain. The fossils of the series are scarcely any of marine types, plants and foot-prints preponderating. The commercial value of the deposits of the Newark series is in the brown sandstone building stone of New Jersey and Connecticut, and the coal veins of North Carolina and Virginia.

NEWARK WORKS. See MOUND BUILDERS AND MOUNDS.

NEWBERRY, nū'bĕr-ĭ, **John Strong**, American geologist: b. Windsor, Conn., 22 Dec. 1822; d. New Haven, 7 Dec. 1892. His early life was passed chiefly in the Western Reserve, Ohio, and he was graduated at the Western Reserve College in 1846 and at the Cleveland Medical School in 1848. From 1851 to 1855 he practised medicine in Cleveland. He was assistant surgeon and geologist to the government expedition that explored the country between San Francisco and the Columbia River; also accompanied Lieutenant Ives in his exploration of the Colorado River, and the expedition under Captain Macomb in its exploration from the Santa Fé to the junction of the Grand and Green rivers. His reports upon the scientific results of these expeditions brought him great credit in the scientific world. At the beginning of the Civil War he became attached to the Sanitary Commission, and later secretary of its Western department. He was afterward

connected with the Smithsonian Institution, and with the Columbian (now George Washington) University, Washington, and in 1866 was appointed professor of geology and palæontology at the Columbia College School of Mines, which post he retained till his death. Besides many special reports and parts of general reports, his writings include: 'The Rock Oils of Ohio' (1859); 'Catalogue of the Plants of Ohio' (1860); 'Iron Resources of the United States' (1874); 'The Structure and Relations of Dinichthys' (1875); 'Palæozoic Fishes of North America' (1889); 'Later Extinct Floras' (1898); etc. He was especially conversant with the palæontology of the Carboniferous Era in America, and particularly with extinct fishes; and as a teacher he had great popularity and influence. He was among the early members of the National Academy of Sciences. The most interesting portions of the 'Report on the Colorado River of the West, Explored in 1857-58' (Washington 1861) were written by him and relate to the geology, physiography and Indians of that region. Consult the memoir by J. J. Stevenson in the *American Geologist* (Minneapolis, July 1893), and White, C. A., 'Biographical Memoir of John Strong Newberry' (Washington 1908).

NEWBERRY, Truman Handy, American naval commander and financier: b. Detroit, 5 Nov. 1864. He was graduated at Yale University in 1885 and entered the railroad business. His industry soon made him a prominent figure in business and financial enterprises of his State. Newberry was one of the organizers of the Michigan State Naval Brigade, serving as landsman (1895), lieutenant and navigator (1897-98). In the Spanish-American War he participated in the attack of the *Yosemite* on the Spanish munitions ship, *Antonio Lopez*. In 1899 he was appointed colonel and aide-de-camp to the governor of Michigan; and later became Assistant Secretary of the Navy (1905-08). On the retirement of Secretary Metcalfe, he was appointed Secretary of the Navy in the Cabinet of President Roosevelt, serving from December 1908 to March 1909. In the European War, Mr. Newberry was given the post of lieutenant-commander of the United States Naval Reserve. In 1918 he was elected to the United States Senate.

NEWBERRY, S. C., city, county-seat of Newberry County, on the Atlantic Coast Line and the Southern railroads, about 40 miles northwest of Columbia. It is in a region in which the cultivation of cotton is one of the chief industries. It has manufacturing establishments for cottonseed-oil, cotton goods, preparing cotton for shipment, coffins, fertilizers and lumber products. It has considerable trade, chiefly in cotton products, fruits and vegetables. It is the seat of Newberry Lutheran College and has a handsome city hall and courthouse. The electric-lighting plant and waterworks are civic property. A mayor and unicameral council elected every two years administer city affairs under a charter of 1894. Pop. 6,000.

NEWBERRY LIBRARY, Chicago, Ill., is a free library of reference established in 1887 and maintained by a moiety of the estate of Walter Loomis Newberry (1804-68), a pioneer merchant of Chicago. Since 1894 it has occupied a fine structure of Spanish-Romanesque

architecture built of Connecticut granite, situated on Walton place, between Dearborn avenue and North Clark street. The collection consists of over 375,000 books, pamphlets, manuscripts, etc., representative of the principal fields of knowledge and branches of learning which fall within its province; bibliography and the history of printing, religion and theology, philosophy, psychology and ethics, history, political science, geography, biography, language, literature and (in part) the fine arts. The original plans of the trustees contemplated the gathering of a general collection of reference and source books on all subjects. Later, however, a co-operative arrangement was entered into with the Chicago public and other libraries under which the field of knowledge was roughly divided among them, and a policy of non-duplication of books was adopted. In each of its divisions the library possesses many treasures, making it one of the most valuable book collections in the United States. Under the head of education, notably, teachers will find an excellent working collection of authoritative works on the past history of their profession and on its present condition, tendencies, methods, theory and practice. The majority of the books are, naturally, mainly intended for the use of professional scholars, but all classes of readers from the most learned investigator to the boy or girl seeking information for school use are welcomed.

NEWBERRY, John, English publisher and bookseller: b. Waltham Saint Lawrence, Berkshire, 1713; d. London, 22 Dec. 1767. Going to London he began in 1745, in Saint Paul's Churchyard, the publishing and selling of books, which he combined with the sale of patent medicines. He also published *The Universal Chronicle* and *Weekly Gazette*, in which Johnson's 'Idlers' appeared, and *The Public Ledger*, in which Goldsmith's 'Citizen of the World' was printed. Newbery made a specialty of books for children, and published the 'Juvenile Library,' a choice collection of volumes, among which were 'Goody Two Shoes,' 'Tommy Trip and His Dog Jowler' and other surviving favorites. He was also publisher of the first religious periodical *The Christian Magazine*.

NEWBOLT, Sir Henry John, English author: b. Bilston, Staffordshire, 6 June 1862. He was educated at Clifton and Oxford and was called to the bar of Lincoln's Inn in 1887. After practising his profession till 1899 he established the next year the London *Monthly Review*, which he edited until 1904. He has published 'Taken from the Enemy' (1892); 'Mordred' (1895); 'Admirals All' (1897); 'The Island Race' (1897); 'Stories from Froissart' (1899); 'Froissart in Britain' (1900); 'The Sailing of the Long-Ships' (1902); 'Songs of the Sea' (1904); 'Songs of the Fleet' (1910); 'The Old Country' (1906); 'The New June' (1909); 'Songs of Memory and Hope' (1909); 'The Twymans' (1911); 'Poems New and Old' (1912); 'The Book of the Blue Sea' (1914); 'The Book of the Thin Red Line' (1915); 'History of the Oxfordshire and Buckinghamshire Light Infantry' (1915); 'Tales of the Great War' (1916); 'The Book of the Happy Warrior' (1917); 'A New Study of English Poetry' (1917). Certain of his patriotic poems, such as 'Admirals

All,' 'Playing the Game,' 'Drake's Hymn' and 'The Vigil,' have established his fame.

NEWBOLT, William Charles Edmund, English Anglican clergyman and author: b. Somerton, Somerset, 14 Aug. 1844. He was educated at Oxford, was vicar of Dymock 1870-77, and of Malvern Link 1877-88. He was principal of the Theological College, Ely, 1887-90, and is a canon and chancellor of Saint Paul's Cathedral. Among his published works are 'Counsels of Faith and Practice' (1883); 'The Fruit of the Spirit' (1888); 'The Prayer Book: its Voice and Teaching' (1889); 'Religion' (1889); 'The Dial of Prayer' (1901); 'Apostles of the Lord' (1901); 'Priestly Blemishes' (1902).

NEWBORN, a sect of Antinomians, which arose in the United States in the early part of the 18th century. Its founder was a German immigrant, named Mathias Bawmann (who died 1727). They held the doctrine of the deification of humanity by regeneration and that those who were regenerates were, like Christ, incapable of sin. They denied that the Bible was necessary for the illumination of Christians, and scoffed at the sacraments. They claimed that their regeneration or newbirth was brought about by dreams, apparitions and supernatural inspiration, and was like the new name written on the white stone and known only to him that receiveth it (Rev. ii, 17). The sect survived the death of its founder by about 20 years.

NEWBURGH, nū'bèrg, N. Y., city in Orange County, on the west bank of the Hudson River, and on the Erie and the West Shore railroads, 58 miles north of New York. The first settlement was made by emigrants from the Rhenish Palatinate, in the winter of 1708-09. They called the place, "Palatine Parish by Quassaic." The Germans were soon followed by emigrants from Great Britain, and in 1750 the English and Scotch were there in numbers sufficient to change the name to "Parish of Newburgh" in memory of Newburgh, in Aberdeen County, Scotland. Before the Revolution the farmers from the river brought their produce here to be sent to market. The lumber trade was most important; ships were built for trade with the West Indies and London; and at one time whaling was an industry of Newburgh. The city occupies a prominent place in the history of the Revolution. It was Washington's headquarters from March 1782 until 18 Aug. 1783. The "Hasbrouck House," which Washington occupied in Newburgh, was purchased in 1849 by the State of New York, and is now used as a museum for Revolutionary and Colonial relics. It is in charge of a board of trustees who have had it restored as when Washington occupied it. While in Newburgh, Washington received the letter (see NICOLA, LEWIS) asking him to become king; here the army was disbanded, and from here the Newburgh Addresses (q.v.) were issued. In 1800 Newburgh was incorporated as a village, the third in the State. After its incorporation the enterprising inhabitants built turnpikes to the farming sections west of the village, and in this way secured the trade of the farmers in the vicinity. Until 1830 sailing vessels plied regularly between New York and Newburgh, but after that date steamboats were used. The

opening of the Erie Canal diverted considerable trade from the village. The first general rowing regatta on the Hudson River was held here in 1837. Others followed in 1840, 1841 and 1842. The country around has many places of historical interest. (See *NEW YORK*). It was granted a city charter in 1865.

The city, viewed from the Hudson River, presents a pleasing arrangement of terraced slopes, broad, clean streets, many trees and beautiful buildings. It is about 310 feet above the river, or Newburgh Bay, as the river expansion here is called. It is in an agricultural region, the commercial centre of an extensive section and of a number of large industries. The chief manufactures are machine-shop products, plaster, cotton and woolen goods, felt hats, silk, leatherette, powder, paper, paper boxes, soap, ice machines, perfumes, furniture, springs, leather, carpets, flour, lumber, foundry products, dairy products, overalls and cigars. It has ship yards, extensive coal, brick and lumber yards. Large quantities of coal from Pennsylvania are brought here to be loaded in coasting vessels and barges. On the northeast corner of the grounds surrounding the "Headquarters" is the "Tower of Victory," made of stone, 53 feet high, with four archways leading into an atrium, and stairways leading into a belvedere. It contains a bronze statue of Washington, copied by O'Donovan from Houdon's model. Other statues represent the soldiers in the War of the Revolution. A tablet bears an inscription telling that the monument was erected by the authority of the Congress of the United States and of the State of New York. It cost \$67,000. The block of brownstone near the entrance marks the grave of Uzal Knapp, the last survivor of Washington's Life Guard; died in 1856. Newburgh has the first free public library in the State, a hospital, orphanage, county tuberculosis sanitarium and home for the friendless. Its educational institutions include several large public and parish schools (Roman Catholic), a free academy, Saint Patrick's Academy and Mount Saint Mary's Academy. There are 25 churches, one of them for colored people. The government is administered under Plan C of the Optional Charter Law of the State, which provides for a mayor and four councilmen, elected for four years. These five select a city manager who wields the executive power. The city owns and operates the waterworks. Pop. 30,366. Consult Ingersoll, 'Handy Guide to Hudson River'; Nutt, 'Newburgh: Her Institutions, Industries and Leading Citizens' (1891); Ruttenber, E. M., 'Town of Newburgh'; Powell, L. P., 'Historic Towns of the Middle States' (New York 1899).

NEWBURGH ADDRESSES, in *American history*, a term applied to two anonymous letters, appearing in 1783, after the close of the Revolution. They were written upon behalf of the American soldiers whose pay had been withheld. It was afterward made known that General John Armstrong was the author of the letters.

NEWBURGH SEDITION, in *American history*; while General Washington had his headquarters in Newburgh, on the Hudson, December 1782, great dissatisfaction manifested itself among his officers, and they addressed a memorial or "round robin" to Congress, de-

manding their back pay, and security for future services. Congress refused to grant the demands, and in the following March an attempt was made to inaugurate a revolt. The matter became so serious that Washington appeared before a meeting of the malcontents and delivered such a patriotic address that the spirit of insubordination immediately disappeared.

NEWBURYPORT, nū'būr-i-pōrt, Mass., city and one of the county-seats of Essex County, on the Merrimac River, three miles from the sea, 35 miles northeast of Boston and on the Boston and Maine Railroad. It extends for about three miles along the bank of the river, but the streets leading back from the river are short; High street, the principal residence street, lies parallel with the river, and State street, the chief business street, is perpendicular to it. In the upper part of the city the river is crossed by a chain bridge (built 1792), the first suspension bridge in America. Among the notable buildings are the Putnam High School, the Anna Jacques Hospital, the Y. M. C. A. Memorial Building, the Old South Church, which contains the remains of George Whitfield, Marine Museum, Old Ladies' Home, and the public library, formerly the old Tracy mansion, where Washington and Lafayette were entertained; the library contains about 40,000 volumes. The house in which William Lloyd Garrison was born is also in the city. In the days of wooden sailing vessels, the chief industry of Newburyport was shipbuilding, and many of the most famous clipper ships were built there; some small vessels are still built. The harbor is good, but access to it difficult on account of the shifting sand bar at the mouth of the river; there is a considerable trade in coal brought to the city by coasting schooners. The more important industries now include boot and shoe factories, cotton factories, hat shops, an iron foundry, comb factory and a silver factory. The mayor, city council and board of aldermen are elected annually. The city owns and operates its waterworks, which were bought from a private company after considerable litigation. Newburyport was settled about 1635, separated from the town of Newbury in 1764, and chartered as a city in 1851. Theophilus Parsons made his home here and it is also the birthplace of Francis C. Lowell. It sent a large quota of troops to the Civil War, and many of its citizens, who were sea-captains, received money from the Alabama claims. Consult Currier, J. J., 'History of Newburyport' (Newburyport 1906); Hurd, D. H., 'History of Essex County, Mass.' (Philadelphia 1888); Smith, 'History of Newburyport, Mass.' (Boston 1854). Pop. 15,618.

NEWCASTLE, Margaret, DUCHESS OF. See CAVENDISH, MARGARET.

NEWCASTLE, Thomas Pelham Holles, 1ST DUKE OF, English Prime Minister: b. England, 1693; d. 17 Nov. 1768. He was the son and heir of the 1st Lord Pelham and as one of the largest land-owners in England his influence, which he used freely in the service of the king, won favor at court and he was made Duke of Newcastle in 1715. He was appointed secretary of state in 1724 under Walpole, to whose downfall he contributed, and held his

post until he succeeded his brother as Prime Minister in 1754. He retired in 1756 owing to his incompetent conduct of the French War, but was recalled in 1757 and formed the ministry so notable because of the dominating brilliancy of Pitt. He was forced out by Bute in 1762, and afterward lived a retired life with the exception of holding for a few months in 1765 the office of Lord Privy Seal. Newcastle was a small man for whom wealth and social position obtained high offices. He was ignorant of the most elementary things. Such abilities as he had lay in the manipulation and purchase of votes in Parliament, on which he spent money freely.

NEWCASTLE, William Cavendish, DUKE OF. See **CAVENDISH, WILLIAM, DUKE OF NEWCASTLE.**

NEWCASTLE, Del., city in New Castle County, on the Delaware River, and on the Philadelphia, Baltimore and Washington, and the Philadelphia and Reading railroads, about seven miles south of Wilmington. It was settled, in 1640, by Swedes. Later it was occupied by the Dutch and then by the English. Newcastle was the place where, in 1682, William Penn landed in America. In 1875 it was incorporated. It is in an agricultural region of fruit orchards and market gardens. Its good harbor, regular steamer connection with large cities, and railroad facilities make it an excellent shipping point for farm products, fruit and vegetables. Considerable fish, especially shad, are caught in the nearby waters. Its chief manufactures are flour, brick, canned goods, woolen and cotton goods, iron products, and men's underclothing. Newcastle has a library founded in 1812, several buildings dating back to Colonial times and two parks. Pop. 3,351.

NEWCASTLE, Ind., town, county-seat of Henry County, on the Blue River, and on the Pittsburgh, Cincinnati, Chicago and Saint Louis, the Cleveland, Cincinnati, Chicago and Saint Louis and the Lake Erie and Western railroads, about 45 miles northeast of Indianapolis. It is in a fertile agricultural and also a manufacturing region. The chief manufactures are agricultural implements, flour, paper boxes, iron and steel products, automobiles, caskets, scales, bridges, lathes, bridge works, pianos, brass furniture, carriages, brick and furniture. It has natural gas, good water power and excellent transportation facilities. Nearby is the Indiana village for epileptics comprising 1,250 acres. The city owns and operates the street-lighting plant and the waterworks. Pop. (1920) 14,458.

NEWCASTLE, Pa., city and county-seat of Lawrence County, situated about 50 miles north of Pittsburgh, at the confluence of the Shenango, the Neshannock, and the Mahoning rivers, which there form the Beaver River, and on the Pennsylvania, the Baltimore and Ohio, the Erie, the Pittsburgh and Lake Erie and the Buffalo and Pittsburgh railroads. The city covers an area of 4,773 acres and, situated as it is in one of the richest and most charming valleys in the world, and having unequalled advantages of water power and railway facilities, it offers exceptional opportunities to the ever-increasing population.

Aside from being the commercial centre for a productive agricultural region, the city is in the heart of rich deposits of iron ore, limestone, coal and clay, and is noted for its great variety of industries. These comprise steel and rolling mills, blast furnaces, tinplate mills, car shops, wire works, paints, hosiery, rubber tires, heating apparatus works, also manufactories of machinery, boilers, castings, blast furnace jackets, pottery and table ware, and vitreous sanitary ware.

Prominent among the public buildings are the United States Government Building, containing the post office, the city hall, the opera house and the Y. M. C. A. building, containing a large library, presented by Ira D. Sankey the evangelist. The Shenango Valley Hospital and the Almira Home for Aged Women are located there.

The inhabitants of the city worship in over 35 church edifices representing nearly all denominations. The educational advantages are of the highest standard of excellence; the pupils are accommodated and receive instructions in a high school supplemented with several graded public schools, while a well sustained business college prepares young men and women for commercial life. Besides these there are also several excellent parish schools.

Newcastle stands high in the average of highways paved; the public improvements have practically all been the outcome of the marvelous growth of the city within the last two decades; during that time the electric railway system, connecting with all the surrounding cities and towns, has been built; a complete system of arc lights has been introduced, the capacity of the water system trebled, and an excellent sewerage system constructed. Cascade Park, an amusement resort, was established by the traction company. The Old Park Cemetery and the Graceland cemeteries are the largest of the "cities of the dead." Newcastle was first settled in 1800 by Robert White; became a borough in 1869, and was chartered as a city in 1875. In 1914 the commission form of government was adopted. Pop. (1920) 44,938.

NEWCASTLE-UPON-TYNE, England, a parliamentary, municipal and county borough and episcopal city, in Northumberland County, and on the northern bank of the Tyne, nine miles from its mouth. It is about 272 miles northwest by rail from London and 124 miles southeast from Edinburgh. It occupies the sides and summits of hills that rise steeply from the river. Coal measures constitute the geological formation; and they stretch southwards to Ferry Hill, northwards to Chevington.

Public Buildings.—The principal public buildings are the Moot Hall (the Northumberland assizes are held here); the Hancock Museum (it contains the collection of John Hancock the naturalist, and many drawings of birds, etc., by Thomas Bewick, the engraver); the Keep of the old Castle, built in Henry II's reign and the Black Gate, at the entrance to the Castle yard (now used as an antiquarian museum). Of other buildings there may be mentioned the Town Hall; the Old Assembly Room; the guildhall (in which is the assize court of Newcastle), and below it, the Exchange; and the Grain Warehouse, on the Quayside. There are one central public and

four branch libraries, three of the latter donated by Sir W. H. Stephenson and one by Mr. Andrew Carnegie; while the Literary Philosophical Society, the Society of Antiquaries and the Church Institute have libraries attached. The Laing Art Gallery was donated by Mr. Alexander Laing in 1904. Of the theatres the chief are the Tyne Theatre and the Theatre Royal.

Places of Worship.—The cathedral church of Saint Nicholas has a famous lantern tower, which was added by Robert de Rhodes about 1450, 100 years after the completion of the church. The tower has been copied elsewhere but never equaled. The clock weighs two tons and is controlled from Greenwich. The largest peal of bells weighs 5 tons 18 cwt. Saint Andrew's is said to be the oldest church in Newcastle, but Saint John's disputes the claim. Saint Mary's Cathedral (Roman Catholic) was designed by Pugin; its charming spire was added in 1872.

Schools, Educational Institutions, etc.—Dame Allan's School, Saint Cuthbert's Grammar School (R. C.), Deaf and Dumb Institute, Northern Counties Orphanage, Church High School for Girls, Central High School, Royal Grammar School, etc. The Armstrong College was founded in 1871 by the University of Durham (to which it is affiliated) and the North of England Institute of Mining and Mechanical Engineers. The College of Medicine (also affiliated to the University of Durham) was built in 1887, and cost £31,000. Rutherford College, not affiliated to the University, was founded by the late Dr. Rutherford.

Municipal Enterprises.—The chief municipal undertakings are the markets, the public libraries, fire brigade, electric tramways, baths and washhouses.

Parks, Hospitals, Bridges.—Town Moor (said to have been held by the burgesses from time immemorial), 927 acres; Leazes, 86 acres; other parks and recreation grounds, 270 acres. The old Royal Infirmary is near the Central Station close to the Armstrong College; a new one to commemorate Queen Victoria's Diamond Jubilee was opened in 1906. Other hospitals, etc., are the Eye Infirmary, Fleming Memorial Hospital for Children, Hospital of Diseases of Throat and Ear, for Incurables, etc. The chief bridges over the Tyne are the High Level, 1,375 feet long, with the railway track 112 feet above high water (built by Robert Stephenson, 1846–50, at a cost of nearly £500,000); the Redheugh; the hydraulic swing bridge (built by Lord Armstrong at a cost of £233,000); and a new railway bridge (North Eastern Railway), opened by the king in July 1906. The Byker bridge crosses the Ouseburn and serves foot and vehicular traffic; whilst a railway viaduct, just to the north of it, carries the traffic of the North Eastern Railway.

Industries and Manufactures.—The coal mines are now all outside the city boundaries. Elswick Ordnance Works are in the west of the city, and this section is famous also for its cycles. The most notable other industries are engineering and shipbuilding. To them may be added the trade in lead, chains and anchors, the manufacture of cement, of steam winches and windlasses, of cordage and cable, paper, cranes, pumps and electric machinery. The

chemical trade, formerly active, has declined of late years. The chief exports are coals, machinery, chemicals, manures, cement, manufactured iron, paints, tar, fire-bricks, fire-clay, etc. Quays are built all down the river side; the docks have 19 feet at low water and accommodate vessels of about 7,000 tons.

History.—The town (first called Pons Ælii, then Novocastria, then Monkchester, then Newcastle-upon-Tyne) is situated near the eastern termination of the Wall of Hadrian, and Roman antiquities have been repeatedly discovered in it. In the Anglo-Saxon period it was a monastic centre. The fortress was built by Robert, son of William the Conqueror, about 1080. It was rebuilt by William Rufus, his younger brother, who "buylded the Newcastle upon the Tyne, the Scots for to gaynstande and to defende." About this time the town received its present name. It received a charter from King John, but the oldest extant is said to be by Henry III in 1239, which confers the right of digging for coal in the neighborhood. The coal trade had attained some importance by 1280. Newcastle was a frequent object of attack, and was repeatedly taken in the wars between England and Scotland. It furnished 17 ships to Edward III for the siege of Calais. It was taken by the Scottish Covenanting army in 1640 and in 1644, and in 1646 Charles was delivered here by the Scottish army to the parliamentary commissioners.

Government.—The city is governed by lord, mayor, sheriff, and council. In the year 1400 a royal charter created Newcastle a county in itself, and Newcastle's first sheriff was appointed in that year. In 1600 the great charter (confirming old privileges and adding new ones) was passed. In 1882 a royal charter created Newcastle a city. In 1906 it was made a royal borough. It is the seat of a United States consul. The city returns members to the House of Commons. Pop. 266,603.

Bibliography.—Bruce, 'Reid's Handbook to Newcastle' (1863, rev. ed. 1903); Gray, 'Chorographia' (1649, re-edited by Crawhall and Reid 1884); Histories by Bourne (1736); Brand (1798); Mackenzie (1827), and Welford (1883–87); Sykes, 'Local Records' (1833); Fordyce, 'Local Records' (1867–76); Guthrie, 'River Tyne' (1880); Rendel, 'Newcastle on Tyne: Its Municipal Origin and Growth' (1898); Richardson, 'Handbook to Industries of Newcastle and District' (1889); Johnson, 'Making of the Tyne' (1895); Heslop, 'Northumberland Words' (1893–94); Corporation Manual, current date, etc.

NEWCOMB, nū'kom, Harry Turner, American lawyer and statistician: b. Owosso, Mich., 4 Jan. 1867. He was graduated from the law department of Columbian University in 1891, and entered the offices of the Chicago, Milwaukee and Saint Paul Railroad in 1882. In 1895–99 he was chief of the transportation department of the division of statistics in the United States Department of Agriculture, and in 1899–1901 was expert chief of the division of agriculture for the United States census. In 1896–1901 he was lecturer on statistics at Columbian University, and in 1901–02 he was editor of the *Railway World*. He began the practice of the law in 1902 and was almost im-

mediately employed as counsel for the Philadelphia and Reading Coal and Iron Company in the arbitration before the Gray commission which settled the anthracite strike of 1902. He organized the firm of Newcomb, Churchill and Frey in 1907 and is now the senior member of Newcomb and Frey, its successor. His practice is chiefly in corporate matters and cases involving the law of interstate commerce and those of taxation, in all of which the principles of jurisprudence are in process of adjustment to meet new economic conceptions and conditions. He has written 'Railway Economics' (1898); 'The Postal Deficit' (1900); 'The Work of the Interstate Commerce Commission' (1905); 'Constitutionality of the Delegations in the Interstate Commerce Law' (1910), etc.

NEWCOMB, Simon, American astronomer: b. Wallace, Nova Scotia, 12 March 1835; d. Washington, D. C., 11 July 1909. He came to the United States in 1853 and taught in Maryland; computed on the *Nautical Almanac* at Cambridge 1857, and was graduated from the Lawrence Scientific School at Harvard 1858. He was appointed professor of mathematics in the United States navy in 1861 and assigned to duty at the Naval Observatory; negotiated contract for and supervised construction of the great telescope; was secretary of the transit of Venus commission (1871-82); and observed transit at the Cape of Good Hope in 1882. He also directed several parties to observe eclipses beginning in 1860. From 1877-97 he was senior professor of mathematics and superintendent of the *Nautical Almanac* office. He retired from active duty in the navy (1897) at the required age of 62, and thereafter devoted himself to both pure and popular science. He was professor in Johns Hopkins University 1884-94 and editor of the *American Journal of Mathematics*, retiring in 1901. He was a member of learned societies throughout the world. Since 1874 he was correspondent and since 1893 associate of the Institute of France, being the first native American to receive the latter honor since Franklin; he was also an officer of the Legion of Honor. He received distinctions and degrees from governments and universities in most civilized countries.

He lectured at Harvard, the Lowell Institute at Boston, etc., and delivered opening addresses at the Flower, Yerkes and other observatories. In connection with his work on mathematical astronomy, besides over 100 papers published in various scientific journals, he has written large works 'On the Secular Variations and Mutual Relations of the Orbits of the Asteroids' (1860); 'An Investigation of the Orbit of Neptune' (1874); 'Researches on the Motion of the Moon' (1876); 'Theory of the Inequalities in the Motion of the Moon' (1894); 'Tables of Uranus'; 'Measure of the Velocity of Light' (1884); 'Uranian and Neptune System'; 'Astronomical Constants and Eclipse Tables.' He founded the *Astronomical Papers of the American Ephemeris* and edited the first eight of this series, which contain his tables of the planets and of the stars now used by astronomers all over the world. This work contains Newcomb's famous lunar researches. Among his more popular writings are 'Popular Astronomy' (1878); 'School Astronomy'; 'Elements of Astronomy' (1900); 'Algebra Geometry'; 'Analytical Geometry'; 'Cal-

culus'; 'Essentials of Trigonometry'; 'The Stars' (1901); 'Astronomy for Everybody' (1902); 'A B C of Finance'; 'A Plain Man's Talk on the Labor Question' (1886); 'Principles of Political Economy' (1887); 'His Wisdom the Defender' (1900); 'Reminiscences of an Astronomer' (1903). He was given the rank of rear-admiral by Congress in 1906, and on his death in 1909 was given a military funeral. For an account of his place in science, see Benjamin, M., paper in 'Leading American Men of Science' (New York 1910), edited by D. S. Jordan.

NEWCOMB MEMORIAL COLLEGE FOR WOMEN, New Orleans. See TULANE UNIVERSITY.

NEWCOMEN, nū-kōm'ēn, Thomas, English inventor of the atmospheric steam engine: b. Dartmouth, Devonshire, February 1663; d. London, August 1729. With the financial help of John Cawley he experimented on Savery's engine, patented 1698, possibly had made previous study of the same problem at an earlier date and may have been a partner with Savery in the patent taken out in 1710. His improvement of Savery's engine consisted principally in separating boiler, pump and condenser. Steam was let into a cylinder from below and a piston above was thus forced up so that a pump rod attached to it by a balance arm was driven downward; cold water was then introduced into the condensing cylinder, a vacuum was there formed, and the external atmospheric pressure drew the piston down into the cylinder, the pump rod being forced up by this action. Newcomen's engine is practically the modern type, which, however, has Watts' condenser; it was successfully used, notably for pumping water from mines. See STEAM AND STEAM ENGINES.

NEWCOMES, The, by Thackeray, published in 1854-55, the last of the four very great novels of the author, is more closely united to 'Pendennis,' to which it is a quasi-sequel, than to 'Vanity Fair' or 'Esmond.' As the theme of 'Vanity Fair' presented a section of life in which most human endeavor ultimately turns to dust and ashes, and 'Pendennis' isolates with almost epic impressiveness the phenomena of the young man, so the 'Newcomes' dwells almost chiefly on family relations. As in the earlier stories Thackeray was faithful to what he saw, and the picture is a powerful one. It is a picture of family rivalry, intrigue, ambition, ill-feeling, worldliness, jealousy, weakness, credulity and many other unattractive characteristics. On the whole the various members of the family are represented in no amiable light: Barnes Newcome is especially detestable, and most of the other Newcomes are mean and selfish. The amiable weakness of the hero, Clive, deserves a better fate than his temporary martyrdom at the tongue of Mrs. Mack the Campaigner, most abominable of mothers-in-law. The two most famous and likable characters, Colonel Newcome and his niece, Ethel Newcome, though they have faults of the head if not of the heart, relieve the general impression. They are the real hero and heroine of the book, and are among the best-known characters in English literature; they are fairly representative of the great vividness and intensity of feeling with which the novel is writ-

ten. Like most of the author's novels, 'The Newcomes' is often highly satirical of English society, Barnes Newcome, Honeyman and young society ladies being specially ridiculed. Certain passages, notably that of the death of Colonel Newcome, are among the famous pieces of writing in English literature. Consult various lives, as that by Trollope and Mrs. Ritchie's introduction in the biographical edition of Thackeray's works.

WILLIAM T. BREWSTER.

NEWDIGATE (nū'dī-gāt) **PRIZE**, a prize in Oxford University, annually awarded for an English poem. It was founded by Sir Roger Newdigate, Bart. (1719-1806), its value being \$110. Among the winners have been several well-known men, such as Ruskin, Matthew and Sir Edwin Arnold, John Addington Symonds and W. H. Mallock.

NEWEL, in architecture, the central space or column round which the steps of a circular staircase are wound. When there is no central pillar the newel is said to be open. The term newel post is also used in this connection.

NEWELL, Frederick Haynes, American engineer, founder of the United States Reclamation Service and its chief engineer from 1902 to 1914: b. Bradford, Pa., 5 March 1862. He was graduated at the Massachusetts Institute of Technology in 1885. Soon after joining the United States Geological Survey in 1888 the director, J. W. Powell, placed him in charge of water investigation, steam gauging and reservoir site surveys, a work which finally developed into the Reclamation Service created by act of Congress, 17 June 1902. Under his direction were built the Roosevelt, Pathfinder, Elephant Butte, Arrowrock and other great dams, and the Gunnison tunnel for the reclamation of about 3,000,000 acres in the West. This work was done with a fund which from 1902 to 1914 amounted to about \$100,000,000. He was member of the commission on revision of land laws, the Inland Water-Ways Commission and of the Natural Advisory Board for fuels and structural materials. After resigning from the Reclamation Service in 1914 he was consulting engineer to that organization until appointed head of the civil engineering department of the State University of Illinois at Urbana. He is the author of 'Hydrography of the Arid Region' (1891); 'Agriculture by Irrigation' (1894); 'The Public Lands of the United States' (1895); 'Irrigation' (1902), and many special reports.
